It was long after the institution of the College of Justice before the writers to the Signet began to act as agents in the Court of Session. They were prohibited from so acting by repeated regulations of their own body, as well as by statute 1672, c. 16, and Act of Sederunt February 26, 1678; prohibitions which, before the beginning of last century, seem to have grown altogether obsolete. The writers to the Signet have long been the principal body of law agents practising before the supreme courts of Scotland; and the individual members of the body are also entitled to practise before the Sheriff Court in all matters which have been transferred by statute from the supreme courts to the Sheriff Court, as proceedings in bankruptcy. They possess the exclusive right of preparing the warrants of charters of land flowing from the crown, of signing summonses citing parties to appear in the Court of Session, and all other writs that pass the Signet as diligences for affecting the person or estate of the debtor, or for compelling implement of the decrees of the supreme court. A very considerable proportion of the conveying business of Scotland is in their hands, and they are largely employed as factors in the management of private affairs. Most of them are notaries-public, in which capacity they protest bills, authenticate deeds for persons who cannot write, and prepare various notarial instruments, the most important of which have been superseded by 21 and 22 Vict. c. 76, substituting registration of conveyances for instruments of sasine. All candidates for the office of notary-public are remitted by the court to the Society of Writers to the Signet for examination. The writers to the Signet are in possession of a large and valuable library.

WRITERS' CRAMP, or SCRIVENERS' PALSY, is a peculiar kind of local spasm, in which every attempt to write instantly calls forth uncontrollable movements in the thumb, the index and middle finger, so that the pen starts up and down on the paper, and instead of a legible handwriting, a mere scrawl results. 'The more,' says Romberg, 'the patient persists in his attempt, the more the difficulty of using his pen increases; and to the visible and sensible contractions of the muscles of the thumb, contractions of the forearm, and even of the upper arm, are often superadded. Abnormal sensations, especially of a sense of weight and constriction of the hand, or of pain extending from the upper arm to the back, are occasionally present. It is diagnostic of these attacks that they are instantly arrested when the individual ceases writing; and that the hand is capable of every other combination of movements and exertions.'—*The Nervous Diseases of Man*, vol. i. p. 320. The disease is chiefly confined to middle age, and scarcely ever occurs in women; and there can be no doubt that an occupation entailing much writing predisposes to it, the quality of the paper or of the pen having nothing to do with it. The treatment hitherto pursued, both local and general, has, according to Romberg, been 'invariably ineffectual.' This is, however, too strong a term, since he mentions a case in which Stromeyer applied the principle of division of the muscles to the cure of writers' cramp, and in one

case a brilliant result justified the antispasmodic reputation of tenotomy; the patient being perfectly able to write as early as the fourteenth day after the subcutaneous division of the tendon of the long flexor of the thumb.' The same operation was, however, several times performed by Dieffenbach without success. Mr Solly, in his recently published *Surgical Experiences*, describes several cases of this peculiar affection, in some of which judicious treatment, combined with entire cessation of writing for a considerable time, led to satisfactory results.

WRITING is the art of fixing thoughts in a palpable and lasting shape, so as to make them known to others. There are two principles employed in this process, either separately or jointly—viz., Ideographism and Phonetism. An ideograph is either a picture of the object the idea of which is to be conveyed, or, at a later stage, some symbol which stands, by common consent, for the object, in which case it is called Symbolism. Phonetism, on the other hand, is either Syllabism—i. e., a combination of consonants and vowels which form a word, or component parts of it—or Alphabetism, a system that further breaks up the syllables into their single component parts of vowels and consonants. All systems of writing seem to have originated in ideographism, and to have gradually arrived at phonetism. The pictorial mode of ideography gradually led, as indicated, to the symbolical mode. The former, also called kyriological (Gr. *kyrios*, principal, proper, the opposite of metaphorical or symbolical) writing, contents itself with representing only bodily things, either by fully or partly depicting them, or by merely indicating them by some special characteristic. The latter—the symbolical mode—represents abstract things in accordance with their similarity to corporeal subjects, as in the hieroglyphs of later Egyptian times. Examples of the real delineations of the subjects, or parts of them, which have been replaced by conventional signs, we find at an early period in Egypt, as well as with the Aztecs, with the primitive Assyrians, in ancient China, and in Guiana. Phonetism here no longer aims at a delineation of subjects or symbols, but of the sounds by which these objects are conveyed to the mind. The first step in phonetic writing is, as we said, the syllabic, which by degrees becomes alphabetical. Difficult though it be in many instances to fix accurately the original ideographic meaning of many of the letters now in use, there is yet absolutely no doubt as to their having once been mere pictures of certain things to which a meaning was attached, the sound of which was in some shape connected with the present value of the letter. Our knowledge of Phœnician, whence our alphabet is directly derived, and of its cognate dialects, enables us, in many instances, to trace them back to their primitive source. Thus, our *A* was originally depicted as the head of an ox, a likeness to which may still be traced in its Phœnician form, and its name (Aleph = ox) has still survived in Hebrew and Greek (Aleph or Alpha). This process of the gradual change of a picture into a character is most clearly traceable in the various stages of Egyptian hieroglyphics, which, when written more cursively, assumed such different shapes, (in hieratic and demotic respectively), that often there remains scarcely a likeness between different forms of the same characters. Among the ideographic methods, there are some, however, which scarcely seem to deserve the name of writing, in the ordinary sense. Such are the Peruvian quippos, or knots, which, by changes in colour, size, arrangement, and the rest, indicate a certain special sequence of ideas; further, the

'khernus' or sticks, which, before the introduction of their present alphabet, the Tartars used to circulate among their tribes, to indicate the number of men and horses to be used for some special expedition. Similar to the Peruvian quippos, was (according to the celebrated Chinese work, *I-king*) also the primitive Chinese mode of writing; while the Scandinavian and Germanic runes rather remind of the Tartar staves. Of a more advanced stage appears the Mexican Pichne-writing, a system by which single syllables or words were expressed by phonograms. The Chinese system appears to combine both the ideographic and phonetic characters; but there is scarcely a doubt that even the phonetic signs are derived from ideographic ones. The step to the alphabetic system, however, was never taken by the Chinese.

When and how our present alphabet was invented, has been matter of speculation from the earliest times. The myths of antiquity ascribed it to Thoth (q. v.) or to Kadmus, which only denotes their belief in its being brought from the East (Kedem), or being perhaps primeval. The Talmud ascribes it to a special revelation. It has been a question whether there were several original alphabetical systems, or whether one is to be assumed as having given rise to the various modes of writing now in use. Thus, three principal sources—Semitic, Chinese, Indian—are given by Klaproth. It is, however, now agreed on all hands that it is the Phœnician character, as we now know it, to which we directly owe our own. See PHŒNICIA. From it many streams have flowed out. The principal of these appear to have been—First, the Semitic, in which the values of the letters have remained almost identical with those of the original Phœnician, with exception, perhaps, of a few sounds added to them in Persian, for the purpose of expressing certain Indo-Germanic sounds not existing in Phœnician. This class has further been subdivided into Hebrew-Samaritan and Aramaic, the latter embracing the square or modern Hebrew, which is closely allied to the Palmyrene, the Estranghelo or Syriac, the Sabian, the Arabic in its different forms, the Mongol, the Pehlvi, Armenian, &c. The second or central division embraces the writing of Greece, Asia Minor, and Italy, from the *Æolo-Doric*, Etruscan, Umbrian, Oscan, and other but little known kinds, to the late Pompeian Graffiti. A further group would include the 'Indo-Homerite' characters, and seems to have originated in Central Arabia, whence it appears to have spread to Africa and India, where the Magadhi—the oldest variation the Phœnician assumed here—gave rise to the five families of Devanaghari, Pali, Dravidian, Oceanian, and Tibetan.

Yet, when we speak of the Phœnician as being the mother of all our known alphabets, we must not be understood finally to ascribe to the Phœnicians the original invention of it in the first instance. We shall only indicate here that the theory to that effect, held by Gesenius and others, will probably, sooner or later, have to give way to the more recent results of De Rougé's investigations, who, with great show of probability, believes it to have been borrowed, or rather adapted from certain archaic hieroglyphics of Egypt. It would appear as if at some very archaic period the Phœnicians had borrowed the hieratic signs then in use; as, indeed, the *Priese Papyrus*, the oldest in existence, exhibits striking similarities with the Phœnician characters. Instead, however, of simultaneously taking the Egyptian names for these characters, they invented new ones according to their own fancy, and to the supposed similarity of the characters to some particular thing. The Egyptian origin of the Phœnician character, if confirmed by

further researches, would be a striking instance of the correctness of the tradition to that effect, which Tacitus has preserved (*Annal* xi. 14).

We have in the course of this work treated at full length several points of this subject. See **HIEROGLYPHICS, CUNEIFORM, ALPHABET, &c.** We may therefore, for a fuller elucidation of the details, refer to those articles. We shall only add in this place that the manner of writing is very different with many nations. The Mexican picture-writing begins at the bottom; the Chinese and Japanese, as well as the Mongols, write in columns beginning from the top, and going from right to left. The Egyptian hieroglyphics have no fixed direction; but the hieratic and demotic, though the single letters are formed from right to left, always run from left to right; as is also the case in Ethiopic, Cuneiform, and Indo-Germanic languages generally. The Semitic languages have retained the Phœnician mode of writing from right to left—all but the numerals—a mode still retained in archaic Hellenic and Etruscan. By degrees, however, the writer, not wishing to return to the beginning of the line, and continuing right underneath the last word penned, a double mode was introduced, called the boustrophedon—as the ox ploughs. Finally, this too was abandoned, and the direction from left to right was followed. About the many various styles of modification our characters have undergone in the course of time, the punctuation of the words, and the rest, we refer to **ALPHABET**. The materials used for writing were of the most different kind, as were also the instruments employed for the purpose. See **PAPYRUS, PEN, &c.**

WRITING FLUIDS. See **INK.**

WRO'NGDOER, in English law, as well as popular parlance, is he who commits some wrong for which an action may be brought to recover damages.

WRY'NECK (*Yuzar*), a genus of birds of the Woodpecker family (*Picidae*), having a short, straight, conical beak; a long extensile tongue, with

Wryneck (*Yuzar torquilla*).

a horny point; wings of moderate size; a rather short and rounded tail; the feet with two toes in front, and two behind. One species, the **COMMON W.** (*Y. torquilla*), is a summer visitant of Britain and the north of Europe. From its appearing at the same time with the cuckoo, it has acquired the name of *Cuckoo's Mate*. It is common in the south of England, but very rare in the northern parts of Britain. It is about seven inches long, of a rusty ash colour, irregularly spotted with brown and black. It feeds on caterpillars and insects, and is often seen on the ground near ant-hills, feeding on the ants and their 'eggs.' The construction of its

tongue resembles that of woodpeckers, and enables it to seize its insect prey with wonderful celerity; the tongue is darted out, and retracted, so that the eye can scarcely follow it; the two posterior branches of the bones of the tongue being much elongated, and muscles for its extension attached to them. There is also a long gland on each side of the lower jaw, which secretes a glutinous mucus, so that insects adhere to the horny tip of the tongue. The **W.** generally makes almost no nest, but deposits its eggs on fragments of decayed wood in the hole of a tree. The young birds are easily tamed, and are great favourites with boys. In France, it is common for boys to tie a string to one of the legs of the bird, and to allow it to climb trees in search of insects. It climbs readily on their clothes. The name **W.** is derived from the habit which the bird has of writhing its head and neck quickly in various directions, with an undulating snake-like motion, which it does particularly if found in its hole in a tree, making at the same time a hissing noise, so as to alarm the intruder; but on his drawing back, it suddenly darts out and escapes.

WULSTAN, or WULFSTAN, and sometimes **WOLSTAN**, a name of interest in connection with Anglo-Saxon history and literature. There are three individuals of the name especially noticeable.

—1. A monk of Winchester in the 9th c., author of a poem, in Latin hexameters, on the Miracles of St Swithin, which is reputed the best Latin poem of that age produced in England.—2. An Archbishop of York, in 1003, author of two pastoral letters and several sermons in Anglo-Saxon, the most remarkable of which is printed in Hicckes's *Theacurus*, vol. iii.—3. The well-known Bishop of Worcester, and a saint of the English calendar. He was born at Icentum, in Warwickshire, about 1007, and educated at Evesham and Peterborough. He became a priest, afterwards a monk and prior of the monastery of Worcester, and ultimately, in 1062, bishop of that see. He lived through the troubles of the Norman Conquest, and enjoyed the favour not only of the Conqueror, but of William Rufus, and died in 1095, at the age of 87. He is by some reputed the author of the portion of Anglo-Saxon Chronicle which extends from 1034 to the death of the Conqueror.

WUPPERTHAL, a celebrated valley of Rhenish Prussia (q. v.), derives its name from the river Wupper, or Wipper, a small affluent of the Rhine, which rises between the towns of Wipperfürth and Hückeswagen, 26 miles north-east of Cologne. Its course is first north, then north-west, past Barmen (q. v.) and Elberfeld (q. v.)—the chief town on its banks—then south-west to its junction with the Rhine between Wiesdorf and Rheindorf, 7 miles below Cologne, after a course of 50 miles. The waters of the Wupper are very abundant, and for the length of its course it supplies motive-power to an extraordinary number (about 400) of mills, of various kinds. It is navigable for small craft below Solingen (q. v.). The Valley of the Wupper is the most actively industrious and most densely peopled in all Germany. Coal is found in abundance.

WUR'NO, a town of the Hãnaa States, Central Africa, 18 miles north-east of Sôkoto, on the Sôkoto, a tributary of the Niger. It is extremely filthy—the small ravine which intersects the town forming a most disgusting spectacle. Barth expresses his astonishment at the quantity of cotton brought into the market, which shewed what the fine vales in the vicinity are capable of producing. The pop. is stated at from 12,000 to 13,000.

WÜRTEMBERG, THE KINGDOM OF, lies in 8° 15'—10° 30' E. long., and 47° 35'—49° 35'

WÜRTEMBERG.

N. lat., is bounded on the W., S.-W., and N.-W. by the Grand Duchy of Baden; E., S.-E., and N.-E. by Bavaria; and S., for a few leagues, by the Lake of Constance and Vorarlberg. Hohenzollern makes a deep indentation into the land from the south, and the entire boundary is very irregular. Detached pieces of territory belonging to W. also lie in the adjacent countries. Its greatest length, from the village of Simmringen in the north, to the Lake of Constance in the south, is 139 miles; and greatest breadth, from the Katzenkopf, in the Black Forest, eastward to the castle of Duttstein in Nerestain, 105 miles. The following table gives the pop., according to the census taken December 3, 1864, and the area in sq. miles:

| Circles. | Area in Square Miles. | Population (1864). |
|---------------------------|-----------------------|--------------------|
| The Neckar, | 1285 | 512,107 |
| " Black Forest, | 1843 | 435,045 |
| " Jagst, | 1986 | 380,866 |
| " Danube, | 2418 | 420,310 |
| Total, | 7532 | 1,748,328 |

The pop. averages 232 to the sq. m. in the Danube Circle falling as low as 173, and in the Neckar Circle rising to 399.

The capital of W. is Stuttgart (q. v.), and there are 5 other towns in the kingdom with a pop. above 10,000, and 10 more with a pop. above 5000. The various districts have no natural capital, and Stuttgart has no rival as to pop. or importance.

Physical Aspect.—The surface of W. is composed of terraces of hill and dale, the lowest point being 420 feet above the sea. In the Black Forest Circle the mountains attain the highest elevation, Baiersbronn being 3781; Schwarzkopf, 3584; Gaiskopf, 3455; and Lemberg, 3313 feet above the sea. The valleys and plains average 500 feet above the sea. Rich pastures, cultivated fields, orchards, gardens, hills covered with vines, and mountains with forests, give the most diversified scenery. In the south-east are extensive past-lands.

Rivers, Lakes, &c.—The most important rivers are: the Neckar (q. v.), with its affluents; the Danube, which receives the Iller; and the Tauber, a tributary of the Main. The Neckar and its streams drain 4200 sq. m.; the Danube, 2037; the rivers which fall into the Lake of Constance, 714; the Tauber, 315; and other water-courses, 168 sq. miles. The only lake in the interior is the Federsee, near Buchau, in the Danube Circle. There is much traffic both by steam and sailing ships on the Neckar, and from Friedrichshaven, on the Lake of Constance.

Railways have been constructed to the extent of 305 English miles, from Bruchsal to Ulm, Ulm to Friedrichshaven, Bietigheim to Hall, Cannstatt to the Bavarian lines, and from Plochingen to Rottenburg. From July 1860 to 1861 were carried 3,146,312 passengers. The gross receipts amounted to 4,613,689 florins, and the expenditure to 2,117,359 florins, or 42½ per cent. of the receipts.

The postal service delivered 9,183,000 letters and crossband sheets, 6,959,962 newspapers, and 2,360,462 packets.

Geology, Mineralogy, &c.—The prevailing rocks are granite, gneiss, limestone, and various sandstones. Tourmaline, cobalt, bismuth, silver, malachite, chalcocony, gypsum, copper, rock-crystal, and iron occur. A great variety of fossils have been found. The peat-lands are extensive, and yield annually 450,000 florins. Fire-clay of excellent quality, earths for dyeing, and native sulphate of lime, are worked. Building materials, from the

granite of the Black Forest to the tufa of the Alb Valley, abound. Clay-band ironstone, yielding from 30 to 36 per cent. of iron, is worked in eleven different districts, and salt in five. The mineral products have a probable annual value of 2,000,000 florins. There are many springs of mineral water, those of Cannstatt and Stuttgart being much frequented.

The climate is mild and healthy, but in the high-lands the winters are long and cold. When west winds prevail, the cold of winter and summer heat are less than in some countries in the same latitude. The greatest quantity of rain falls in summer. In 1861, the cereals and other field-crops occupied 2,628,337 *morgens* of land; the forests, 1,919,311; hay and pasture, 1,148,538; gardens and parks, 121,504; and the vineyards, 82,921. The vineyards are chiefly in the Neckar Circle and that of the Jagst. The forests, grain, and pasture lands are nearly equally distributed throughout all the circles. Wheat, oats, barley, rye, potatoes, beans, maize, turnips, mangold-wurzel, lucerne, &c., are the principal agricultural products. The total value of farm-produce, including hay, was 118,576,739 florins, to which must be added that of the vineyards, 3,750,293 florins, and of the extensive orchards in all parts of the land. Cherries, damsons, walnuts, peaches, apricots, and the more common fruits, are largely grown. Garden produce is valued at 3,500,000 florins. The stock consisted of 79,711 horses, 957,172 horned beasts, 663,842 sheep, 216,965 pigs, 43,714 goats, and 104,583 bee-hives: total value, 120,000,000 florins.

Manufactures, Industries, &c.—The manufactures are chiefly linen, woollen, cotton, and silk fabrics. Wool and cotton spinning, bleaching, dyeing, printing, iron-founding, making machinery, outlery, gold and silver articles, glass, porcelain, earthenware, tile, cabinet-work, sawing wood, carriage-building, grinding corn, book-printing, and the cognate trades are principal industries. There are many oil-mills, beer-breweries, and brandy distilleries. Water is almost exclusively the motive-power employed in the manufactories and mills. In W., more than 215,500,000 bottles of beer, or 125 for each person, are consumed yearly, besides wine, brandy, and liqueurs. The total value of land, houses, railways, movables, &c., is reckoned at 2710 million florins, and the income of the people at 276,000,000—140,000,000 being from land produce, 131,000,000 from the industries, and 5,000,000 from interest on foreign funds. The exports are chiefly grain, cattle, wood, salt, oil, leather, woollen, cotton, and linen goods, beer, &c.

Religion, Language, Education, &c.—The population of Old Württemberg is almost entirely Lutheran. The numbers of each denomination will be seen in the subjoined table from the census, 3d December 1861:

| Circles. | Evangelical Lutherans. | Roman Catholics. | Other Christians. | Jews. |
|---------------------------|------------------------|------------------|-------------------|--------|
| The Neckar, | 466,118 | 36,838 | 1404 | 3,015 |
| " Black Forest, | 318,065 | 111,747 | 426 | 1,438 |
| " Jagst, | 259,048 | 118,114 | 347 | 4,240 |
| " Danube, | 146,588 | 265,358 | 322 | 2,636 |
| Total, | 1,179,814 | 527,057 | 2499 | 11,338 |

On the budget stood 710,000 florins for the Evangelical Church, 365,036 for the Roman Catholic, and 7000 for the Jews.

Several dialects of German are spoken, of which the Swabian and Franconian are the most general. W. has been the native country of many distinguished men, of whom a few may be mentioned. In poetry:

Schiller, Uhland, Wieland, Kerner; in theology and philosophy: Brentz, Ceolampadius, Bengel, Baur, and Strauss, Gustavus Werner, &c.; in science and art: Kepler, Stiefel, Tobias Mayer, the botanists Joseph and Karl Friedrich Gärtner, the chemist Schönbein, the painters Eberhard Wächter, Hetch, and the famed sculptor Dannecker.

Every child between 7 and 14 years must attend school. In a district having 30 or more families, is a public school, and a teacher for every 90 children. There are four Protestant theological seminaries, with a course of four years; gymnasia, grammar, trades, and high schools in all the principal towns. The university at Tübingen has 41 ordinary professors, 9 extraordinary, and 19 tutors. In 1862—1863, the students numbered 620, of whom 167 were foreigners. At Hohenheim is an agricultural and botanical institution, in which farming, management of forests, and gardening are scientifically taught. Stuttgart has a polytechnic school, with 25 teachers, 9 assistants, and, in the summer of 1863, 248 pupils. The government outlay on education amounts annually to 777,702 florins.

Revenue, Expenditure, &c.—For the year 1863—1864, the revenue was 16,239,688 florins; expenditure, 15,727,547. The civil list and appanages amount to 1,127,192 florins; interest of the national debt, 3,286,020 florins. Of the income, 6,824,599 florins came from public property, and 9,415,089 florins from direct and other taxes. The railways yielded 2,045,000 florins, and the post-office 246,000 florins of clear revenue. The strength of the army, including the reserve, is 25,583 men.

Government, &c.—The crown is hereditary in the male line, and failing that, in the female. Freedom of the press and religion are enjoyed. The privy-council consists of a president, the six ministers of state, and members named by the king. The legislative body is composed of two chambers—the first being formed of princes of the royal family, nobles, and members appointed by the king, the last named not exceeding a third part of the whole; the second chamber is composed of 13 representatives of the knighthood, 6 Protestant general superintendents, the chief bishop, a member of the cathedral chapter, the senior Roman Catholic deacon, 7 representatives from the cities Stuttgart, Tübingen, Ludwigsburg, Ellwangen, Ulm, Heilbronn, and Reutlingen, with a representative from each of the 63 bailiwicks. Members of the second chamber are not eligible as such before reaching their 30th year. The king has the power of proroguing or dissolving the chambers; but in the latter case, a new election must take place within six months. So long as there is no meeting, the two presidents, two members elected out of the first, and eight out of the second chamber, carry on the public business.

History.—The earliest inhabitants of W. were probably Celts; but when the Romans came first to know the country, it was held by the Suevi, who were succeeded by the Alemanni and the Franks. In 1090, Conrad, Count of Würtemberg, possessed a castle near Cannstatt, and limited territories, which were largely added to by Ulric I. from 1246 to 1265. Other extensions were gained by Eberhard I. between 1279—1325; by Ulric II., who, though a man of peace, added Tübingen; Eberhard II., who secured Teck, Gutenberg, Kirchheim, Herrenberg, and other places. By the marriage of Eberhard IV. with the Countess of Montbéliard, that county became connected with Würtemberg. At his death, the possessions were divided between his two sons, each of whom enlarged his portion; and a few years after their death, Eberhard V. secured a reunion, and the land advanced rapidly in power

and importance. In 1495, the Emperor Maximilian raised Eberhard to the rank of Duke, with the title of Eberhard I. In 1519, Duke Ulrich having offended the Swabian League by some arbitrary acts of oppression exercised upon the imperial free city of Reutlingen, he was forcibly ejected from W., and did not reconquer his estates till 1534. While Eberhard III. was Duke (1628—1674), W. suffered much in consequence of the Thirty Years' War. Ludwig Eugene (1793—1795) having taken part in the war against the French Republic, a French army attacked and compelled him to resign Montbéliard, and pay 8,000,000 francs.

With Duke Frederick II., who succeeded his father in 1797, the most important period in the history of W. begins. In 1800, compelled by the French to flee from his dukedom, he got back, by the Peace of Lunéville, all his territories except Montbéliard, and instead, had others granted, with the rank of Elector. Having aided Napoleon in the war against Austria, at the Peace of Presburg (26th December 1805), W. was further enlarged, and made a kingdom. After the battle of Leipzig, Frederick abandoned the cause of Napoleon, and concluded a treaty with Austria, in which his lands were guaranteed. His reign was arbitrary; and internal troubles were thickening around him, when he died (30th October 1816), and was succeeded by his son, William I., who was born at Lubin, in Silesia, 27th September 1781. He was cordially welcomed to the throne, and the expectations of his subjects were realised. His first acts were to reduce the expenditure, and introduce other reforms, prominent among which was the liberal constitution of 1819. In 1848—1850, a strong agitation was kept up with the view of obtaining some permanent modifications in this constitution, but without success. For nearly 50 years, he reigned over a people steadily increasing in prosperity, and died 25th June 1864, at Rosenstein Castle. His son, Charles Frederick Alexander, now Charles I., born March 6, 1823, succeeded him. See GERMANY, in SUPPLEMENT.

WÜRZBURG, a former sovereign bishopric or ecclesiastical principality of the German Empire, was founded in 741 (according to other accounts, 742 or 746), and received endowments from the Frankish kings, which were afterwards increased by the German emperors. The first bishop was Burkhardt, who was consecrated by Boniface. The patron saint was Kilian (q. v.), who is said to have preached the gospel here as early as 688. By good management and economy, the bishops were able to acquire numerous possessions of the neighbouring Frankish proprietors; and out of these was gradually formed the extensive sovereign bishopric of W., ruled over by the prince-bishop as Duke of Franconia. The ducal title and authority were first conceded about 1120. In spiritual matters, the bishops were under the Archbishop of Mainz. The area of the bishopric was as much as 1827 sq. m., with a pop. of 250,000, and a yearly revenue of 600,000 gulden. At the Peace of Lunéville (1801), the bishopric of W., like the other spiritual principalities of Germany, was secularised; and in 1803, the greater part of it was conferred on the Elector of Bavaria as a secular principality. The last prince-bishop received a pension, and died at Bamberg in 1808. At the Peace of Presburg (1805), Bavaria gave up W. to the Grand Duke Ferdinand of Tuscany, and the principality was raised to the dignity of an electorate. In 1806, the Elector Ferdinand joined the Confederation of the Rhine, and from that time took the title of Grand Duke of Würzburg. By a decree of the Vienna Congress, the grand duke received his hereditary state of Tuscany, and W. reverted to Bavaria. At present, the greater

part of the bishopric belongs to the circle of Lower Franconia.

WÜRZBURG, capital of the former principality of Würzburg, now of the Bavarian circle of Lower Franconia, is situated in a beautiful valley on both sides of the Main, over which there is a stone bridge 600 feet long, of eight arches. The number of inhabitants amounts to 41,062, of whom 2500 are Protestants. Among the public buildings, the most distinguished are the Episcopal Palace or Residence, rebuilt in 1720—1744, one of the most magnificent royal residences in the world; and the spacious and excellently fitted-up Julius Hospital, established in 1576. Of the numerous churches, the most worthy of notice are the richly-decorated cathedral, which was rebuilt in the 11th and following centuries; the Marien-kapelle, one of the most beautiful monuments of old German art, with 14 statues of the 15th c. by Tilmann Riemenschneider; and the Neumünster Church, containing the bones of St Kilian. The streets adjoining the Palace Square are wide and straight, but most of the others are narrow and crooked. In front of the Julius Hospital there is a bronze statue of the founder, Bishop Julius, by Wiedemann, founded in bronze by Miller; a monument of Walther von der Vogelweide (q. v.) stands in a niche outside the Neumünster Kirche.

The university of W. was founded in 1582 by Bishop Julius, who also founded the hospital above mentioned. The endowments for both institutions were taken from the possessions of the convents that were destroyed during the Peasant War (q. v.). In order to promote the study of medicine, the hospital was put in connection with the university, the professors of medicine being made physicians and surgeons to the hospital; this connection has all along kept the medical faculty in high reputation, and promoted the prosperity of the university as a whole. The present medical staff includes several names of European reputation, among others, Kölliker (q. v.) and Virchow (see SUPPLEMENT). In the law faculty, a professorship of French law was established in 1821 for students from the Rhine districts. There is also a faculty of political economy. The library contains above 100,000 vols. In the Musical Institute, any one can receive instruction gratis in singing or in playing on any instrument; and twice a week there are great musical pieces performed. In W., besides the university, there is a gymnasium, a Latin school, a district agricultural and trade school, a seminary for Catholic priests, and a seminary for training teachers, an orthopedic institution, a veterinary school, a school for midwifery, a swimming school, a society for the improvement of the arts and manufactures, and a female society for the encouragement of skill in arts and handicrafts among women. Besides the Julius Hospital, there are asylums for the deaf and dumb and for the blind, and other charitable institutions. The manufactures are woollen stuffs and cloth, mirror-glass, leather, tobacco, railway carriages, and sparkling wines. The fortress of Marienberg, built on the site where Drusus founded a castle, is situated on a hill 400 feet high, on the left bank of the Main, outside the town, and was, till 1720, the seat of the bishops. On a slope of that hill, called the Leiste, the Leistenwine grows, and on the Steinberg, opposite the fortress, the Steinwine. W. is connected with many important places by railway.

WÜRZEN, a small walled town of Saxony, 15½ miles east of Leipzig, picturesquely situated and surrounded by romantic valleys, on the Mulde, here crossed by two bridges. Pop. about 6000,

employed in brewing, bleaching, weaving, and hosiery-work. It is a station on the Leipzig and Dresden Railway.

WYANDOTS, a tribe of North American Indians, of the Iroquois family, the Hurons of the French writers, who called themselves Wendats or Yendats, first known at Montreal, where, in the middle of the 17th c., they became Roman Catholics under the instructions of the French missionaries. Having, as allies of other tribes, become involved in a war with the Iroquois, they were nearly exterminated, and the remnant emigrated to the country around Lake Superior; then gathered at Mackinaw, 1670, under the care of Father Marquette, thence came to Detroit, where they furnished 400 warriors to the English in 1812. In 1829, they were settled, to the number of 600, on the head-waters of the Sandusky River in Ohio; and in 1832, by a treaty with the United States government, removed to Kansas, where the few remaining have acquired the rights of citizenship, each having of their divided lands a farm of 40 acres.

WYATT, RICHARD JOHN, an English sculptor of great eminence, was born in Oxford Street, London, on the 3d of May 1795. He belonged to a collateral branch of the family which made the name of Wyatt famous during two centuries in connection with architecture and sculpture, sharing their descent from a stock of yeomen long settled at Weeford in Staffordshire. Having the bias of his family towards art, he became an articulated pupil of Charles Rossi, R.A., sculptor, and afterwards a student of the Royal Academy, whose medal was twice awarded to him during his pupillage. He afterwards passed some time in Paris, studying under Bosio; and from Paris, in 1821, he went to Rome, and entered the studio of Canova, where he had Gibson for a fellow-pupil. The remainder of his life was spent in Rome, in complete devotion to the prosecution of his art; and he died at Rome on the 29th of May 1850. His youth had shewn great promise, in the estimation of painters like Lawrence and sculptors like Canova; and the works which he produced in rapid succession, early placed him in the front rank of English sculptors. Several of his works were shewn at the Great Exhibition of 1851, and the medal for sculpture was awarded to him, though he had died in the previous year. Living only for his art, he laboured at it incessantly—often, it is said, from dawn till after midnight; and the number of his works is very great. Elegance and refinement, singularly combined with animation and finish of workmanship, are his characteristic merits, but his works also disclose a lively and graceful invention. His favourite subjects were classical and poetical. His most admired productions are in England, and casts from several of them are to be seen at the Crystal Palace. He was not admitted to the honours of the Academy, a by-law of that institution confining its membership to artists resident in England.

WYATT, SIR THOMAS, was born in 1503, at Allington Castle in Kent. His father, Sir Henry Wyatt, of a family originally of Yorkshire, stood high in favour with Henry VII.; and not less so with Henry VIII., who succeeded him. In 1515, the young W. was entered at St John's College, Cambridge, where in due time he took his degrees of Bachelor and Master of Arts. Whilst still very young, he was married to Elizabeth Brook, daughter of Lord Cobham. Through his father's influence, a career at court was open to him. In this sphere he was thoroughly well qualified to succeed; he was one of the most accomplished men of his day; of a noble presence and fine manners, and withal dexterous and subtle in the management of affairs,

though of unimpeached honour and integrity. In 1536, he received at the hands of the king the honour of knighthood; and the next year he was made high sheriff of Kent. Though necessarily involved in much perilous court intrigue, he continued—though once or twice in some hazard of losing it—to retain the favour of the king, and was frequently employed by him in positions of trust and importance. His chief service was rendered, as English ambassador at the court of Charles V., in which capacity he acquitted himself with much diplomatic tact and skill. In 1542, in token of the king's appreciation of his services, he received a grant of lands, at Lambeth; and the year after, he was named high steward of the king's manor at Maidstone. He had now very much withdrawn himself from public life, and lived for the most part retired at Allington. On the 11th of October 1542, he died at Sherborne, of a fever contracted, it is said, on an overhasty journey caused by a sudden summons to attend the king.

Among the other accomplishments of W. was that of verse, which he seems to have begun to cultivate early, and continued through life to practise. During his life, he had acquired considerable reputation as a poet; and in 1557, his poems, along with those of the celebrated Surrey, were published in London. As marking a stage in the progress of our early literature, they hold a permanent place. His love poetry is somewhat overrun with conceits derived from the study of Italian models; but some of the shorter pieces are models of grace and elegance. His satires also possess very considerable merit. More lately, in 1815, an edition of his works, in two volumes, was published in London.

WYATT, SIR THOMAS, surnamed 'the Younger,' to distinguish him from the preceding, of whom he was the only son, was born about 1520. After a wild and riotous youth, he raised a body of men at his own expense, and did good service at the siege of Landreies (1544), displaying considerable military talent; and continued in honourable service on the continent till 1550. In 1554, when the Spanish match was in agitation, W. joined the insurrection, and led the Kentish men to Southwark, after gaining considerable successes over the royalists; but failing to capture Ludgate, he became separated from the main body of his followers, and was taken prisoner, and soon after executed, 11th April 1554.

WYCHERLEY, WILLIAM, a comic dramatist of the period of the Restoration, was born at Clive, near Shrewsbury, in 1640. His father, a cavalier squire of £600 a year, sent his son to France at the age of 15; and during his residence on the banks of the Charente, the youth was a favourite at the court of the governor of Angoulême, whose accomplished wife, the Madame Rambouillet of Voiture, converted him to the creed of the Church of Rome. On his return to England in 1660, W. studied a short time at Oxford, where he was reconciled to the Anglican Church, and he was entered of the Middle Temple. His first comedy, *Love in a Wood*, was acted with great applause, and published in 1672, and it was followed by three other successful comedies, *The Gentleman Dancing-master*, 1673; *The Country Wife*, 1675; and *The Plain Dealer* (his best work), 1677. About 1680, the dramatist was married to a young and rich widow, the Countess of Drogheda, whom he had met at Tunbridge. The lady was distractedly jealous of him, kept him from frequenting the court, which lost him the favour of the king, and watched him closely wherever he went. She did not live long, and she left him the whole of her fortune; but his succession to the estate

was disputed, and an expensive lawsuit ensued, the costs of which, added to personal debts, fairly broke down the unlucky dramatist. He was committed to the Fleet, and suffered to languish there neglected for seven years. He was partly relieved by the bounty of James II.—probably because he returned to the communion of the Church of Rome—and he succeeded to the patrimonial estate in Shropshire by the death of his father. This did not, however, much relieve him, as the estate was heavily mortgaged, and strictly entailed. He was on bad terms with the heir-at-law, his nephew; and on purpose to injure this relative, W., at the age of 75, married a young girl, on whom he settled a jointure; and eleven days after this transaction—the last and perhaps the most scandalous act of his life, as Macaulay describes it—the old dramatist died. His death took place in December 1715, and he was interred in St Paul's Church, Covent Garden. Besides his comedies, W. published a volume of wretched *Miscellany Poems*, 1704; and another volume, partly consisting of 'moral reflections,' was published after his death. The comedies of W., on which his fame rests, reflect the literary taste, the manners, and vices of the times in which he lived. They are, in truth, grossly immoral and profligate. They have, however, some literary excellence. The language is clear and forcible, the dialogues often witty and lively, some of the characters vigorously drawn, and the observations and maxims scattered throughout the different scenes are shrewd and sensible, and expressed in a terse sententious style. W. was the founder of that school of artificial comedy which Congreve, Farquhar, and Sheridan carried to its highest perfection, imparting to it an airy grace and brilliancy far above the reach of its first master.

WY'COMBE, CHIPPING or HIGH, a municipal and parliamentary borough in Bucks, surrounded by beech-clad hills, 28 miles west-north-west of London, on the Wye, a small affluent of the Thames. The church of All Saints is a large and handsome building, erected in 1273; it is in the Norman and early English style of architecture, and consists of a body and two aisles, and, with the chancel, is 180 feet long, and the nave 48 feet high. The tower is 96 feet high, and was built in the year 1522. There are corn and paper mills on the Wye; beech-wood chairs are made here, and lace-making is carried on. At two miles' distance is the village of West Wycombe. The borough returns two members to the House of Commons. It is connected with the Great Western Railway. Pop. (1861) of municipal borough, 4221; of Chipping Wycombe townships, 4152; of parliamentary borough (which includes both), 8373.

WYE, a river of England, of great picturesque beauty and considerable importance, an affluent of the Severn, has its origin in two copious springs which issue from the south-east side of Plinlimon, not two miles from the head-water of the Severn (q. v.). It flows in a south-east direction through Montgomeryshire and Radnorshire, forming the south-west and south boundary of the latter, east-south-east to the middle of Herefordshire, and then south, dividing in its lower course the county of Monmouth from that of Gloucester, and entering the estuary of the Severn below Chepstow. Length of course 130 miles, for 70 miles of which to Hereford it is navigable for barges, though large vessels cannot ascend above Chepstow Bridge. At Chepstow (q. v.), the tide rises higher than at almost any other place in Great Britain. The chief affluents of the W. are the Lug and Ithon on the left, and the Monnow, the Caerwen, and Irfon on the right. The part of the river which separates Monmouth from

Gloucester is that chiefly visited for its singular beauty.

WYKEHAM, WILLIAM DE, was born at Wickham, in Hampshire, in 1324. He was educated at Winchester. The first office which there is evidence of his having held is that of clerk of the king's works, in his manors of Henle and Yethampsted. The patent is dated May 10, 1356. He rose quickly in royal favour; and on October 8, 1366, by the king's recommendation, he was elected Bishop of Winchester. He was consecrated October 10 of the year following. Meanwhile, he had been appointed Lord High Chancellor of England; in which office he was confirmed September 17, 1367. He resigned on March 14, 1371, on a petition being presented to the king against the government remaining too long in the hands of men connected with the church. He now devoted himself to various objects of lasting usefulness. His preparatory college or school at Winchester was opened for teaching in 1373; but the building of the college was not begun till 1387. It was finished in 1393. In the college which he instituted at Oxford, teaching had also begun in 1373; but the building of 'St Mary's College of Winchester in Oxford' was not begun till 1380; it was finished in 1393. He began the rebuilding of Winchester Cathedral in 1395, and just lived to see it finished. Meanwhile, he had become the object of resentment to the Duke of Lancaster and party, at whose instance he was indicted for pecuniary defalcation, and other crimes alleged to have been committed by him as Keeper of the Privy Seal and Lord Chancellor. He was heard in 1376 before a commission of peers, bishops, and privy councillors, declared guilty, and a severe sentence was passed upon him. It was, however, ultimately commuted into a fine, which was remitted on the accession of Richard II. in 1377. He was one of the council of 14 appointed to the king in 1396, and in May 1399 he was again made Lord Chancellor. He continued in office till September 27, 1391, when he resigned; and from this date he appears to have taken little active part in public affairs. He was present in the parliament held on September 30, 1399, when Richard II. was deposed. He was also present in the first parliament of Henry IV. He died at South Waltham, September 27, 1404.—See *Life* by Dr (afterwards Bishop) Lowth (Lond. 1754), himself a distinguished alumnus of Winchester School. W. of Wykeham was one of the most munificent benefactors of the English Church; but he was not a fanatic. He loved learning, order, civilisation, and purity of manners; and as Bishop of Winchester, signalled himself by his rigorous reformation of ecclesiastical abuses; but he had not the slightest tendency towards *Protestantism*, affording, in this respect, a most striking contrast to his great contemporary Wicliffe (q. v.). W. of Wykeham may be taken as the type of a class of English Churchmen both before and after the Reformation—men who are destitute of zeal on questions of doctrine, but zealous for the dignity, culture, and practical efficiency of the church.

WYNTOUN, ANDREW, an old rhyming Scottish chronicler, lived in the beginning of the 15th century. Except that he was prior of the monastery of St Serf on Loch Leven, and wrote *The Ormyngale Cronykil of Scotland*, well known and valued by students of that kind of curious literature, almost no infor-

mation regarding him has been preserved. Though with the usual proportion of extravagant fable, his work is not without considerable historical importance; while philologically it has very distinct value, as a specimen of the old Scotch, then as nearly as may be identical with the contemporary dialect of England. The *Ormyngale Cronykil* consists of nine books or cantos, of which only the last four are devoted to Scottish history; the first five giving a fragmentary outline of the history and geography of the ancient world. W. was probably a well-read scholar for his time. He repeatedly quotes such authors as Aristotle, Galen, Livy, Josephus, &c., and seems familiar with Virgil, Horace, and Ovid, Origen, Jerome, and Augustine. His style is not essentially different from Barbour's, and his versification is the same—the pleasant octo-syllabic. In 1795, a splendid edition of this curious old work was published by Mr David Macpherson, in 2 vols. octavo, from the MS. in the Library of the British Museum.

WYOMING VALLEY, a beautiful, fertile valley on the Susquehanna River, in Pennsylvania, U. S., 21 miles long by 3 wide, surrounded by mountains 1000 feet high, its name supposed to be a corruption of the Indian *Maughawwame*—large plains. It was purchased about 1765 by a Connecticut company from the Delaware Indians; but the settlers were soon dispersed by hostile savages. In 1769, 40 families came from Connecticut, but found a party of Pennsylvanians in possession, and for several years there were continual contests of the settlers with the Indians, and with each other. The Connecticut colony finally succeeded, and their town of Westmoreland had 2000 inhabitants. In 1776 they armed for their own defence against the English and their Indian allies; but in 1778, most of their troops were called to join the army under Washington. June 30, a force of 400 British provincials, or 'Tories,' and 700 Seneca Indians, led by Colonel John Butler, entered the valley, and were opposed by 300 men, under Colonel Zebulon Butler. On July 3, the settlers were driven to the shelter of Fort Forty (so called from the original number of families), with the loss of two-thirds of their number, many soldiers and inhabitants being murdered, a half-breed Indian woman, called Queen Esther, having, in revenge for her son's death, tomahawked fourteen with her own hand, near a rock which bears her name. On the 5th, the remnant of the troops surrendered, and they and the inhabitants were either massacred, or driven from the valley, which was left a smoking solitude. Campbell's *Gertrude of Wyoming*, founded upon the stories of this disaster, contains exaggerations and misstatements, notably that of attributing the leadership to Brandt, who was not in the expedition. It was not till the commencement of this century that the disputes between the Connecticut and Pennsylvanian settlers were finally disposed of. The valley is now one of the most flourishing districts in the state.

WYVERN, a fictitious monster of the middle ages of frequent occurrence in heraldry. It resembles a dragon, but has only two legs and feet, which are like those of the eagle.

Wyvern.

X

THE last letter of the proper Latin alphabet, and the last but two of the English. It is in reality a superfluous character, being equivalent in English, as it was in Latin, to *ks* or *gs*. In form, it corresponds to the Greek χ , but in power to Greek ξ . It was a later addition to the Latin alphabet, having been introduced, according to Corssen, between the time of the Decemvirate and the fall of Veii: this accounts for its position in the alphabet. Some Roman scholars did not acknowledge the character, but wrote *cs*, *gs* instead; and this substitution frequently occurs in inscriptions (e. g., *ucsoi* for *uzori*). At one period of Roman literature, *xs* was often written for *x*; e. g., *saxsum*, *lexs*. In the popular pronunciation, the guttural element of the character gradually disappeared, until, in the later period of the Empire, *x* was undistinguishable from *es* or *s*; thus, inscriptions shew *visit* for *visit*, *miles* for *miles*. This change survives in modern Italian, which substitutes *es* or *s* for the Latin *x*, as *sasso* = *saxum*; *straneo* = *extraneum*; and uses *x* only in foreign words. In Spanish, in the beginning of words, *x* has a guttural sound, something between *ch* and *y*. In German, the use of *x* is mostly confined to foreign words; in native words the sound is usually represented by *chs*, as *wachsen*, to wax or grow, though some write, e. g., *axe* for *achse*.—In Algebra, *x* is the usual symbol for the unknown quantity which is to be determined.

XANTHEINE AND XANTHINE OF FLOWERS. The colouring matters of various flowers have been carefully examined by Fremy and Cloez, who believe that the various tints may be referred to three distinct substances, of which one is of a blue or rose colour, while the other two are yellow. These pigments have received the names of *Cyanine*, *Xanthine*, and *Xantheine*; the first being derived from the Greek *kyanos*, sky-blue; and the last two from *xanthos*, yellow. None of these substances have, however, been extracted in a pure condition, and hence nothing definite can be stated regarding their composition or properties.

XANTHINE, or XANTHIC OXIDE ($C_{10}H_4N_4O_4$), was first described by Dr Marcet, who regarded it as a very rare constituent of urinary calculi, and from its composition he gave it the name of *uric oxide*. During the last ten years, it has been proved to be a normal ingredient (although to a very small amount) of human urine, and has been found in the brain, the spleen, the pancreas, and the liver of the ox; in the thymus gland of the calf; and in the muscular tissue of the horse, the ox, and of fishes; as well as in the liver of various animals. Calculi composed of this substance are extremely rare, the total known number obtained from the human subject being less than half a dozen. They are of a light-brown cinnamon colour, assume a waxy appearance when rubbed, and consist of concentric layers easily separable from one another. *Xanthine* occurs in such very minute

quantities in the various tissues, and is so rare an ingredient of calculi, that it is unnecessary for us to enter into any description of its properties, further than to state that, when dried, it exists as a yellowish white powder, which assumes a glistening appearance when rubbed, and exhibits no signs of crystallisation under the microscope; moreover, the chemical difficulties of detecting traces of this substance are so great, that we shall not attempt to describe its tests. It seems to be intermediate to uric acid and hypoxanthine, both in a chemical and a physiological point of view. The composition of uric acid is represented by the formula $C_{10}H_4N_4O_6$, that of xanthine by $C_{10}H_4N_4O_4$, and that of hypoxanthine by $C_{10}H_4N_4O_5$. The former two occur simultaneously, not only in the urine, but in the spleen, the liver, and the brain; while xanthine is not only invariably accompanied by larger or smaller quantities of hypoxanthine, but the latter can be made by the oxidising action of nitric acid to yield a product from which xanthine (in place of hypoxanthine) may be obtained by a process of reduction. Xanthine must be regarded as a higher stage of oxidation of hypoxanthine, and a product of the regressive metamorphosis of the tissues, which, in the ordinary condition of the system, is excreted in a more highly oxidised form of urea, uric acid, &c.

This substance is stated to have been found by Gübel in some oriental bezoars, extracted from the intestines of certain ruminating animals. It is most probable that the supposed bezoars were in reality urinary calculi.

XANTHIPPÉ, the wife of Socrates, has acquired the reputation of having been an arch-termagant, doubtless not without some foundation. It ought, however, to be remembered that her naturally infirm temper must have been not a little tried by the small concern manifested by Socrates in the regulation of his domestic affairs, which appears occasionally to have made it difficult for X. to 'make both ends meet.' Socrates himself, it is known, had completely mastered his naturally strong appetites and passions, and had acquired a temper of perfect serenity. It is quite natural, then, that contrast-lovers and story-mongers should, as a foil, match so great a practical philosopher with a woman of such an ungovernable temper as X. is said to have been. She herself, if we can trust Plato, appears to have really loved her husband, and he at his death committed her tenderly to the care of his friends. Many stories are told of her, as of every other notable character in history, to illustrate her peculiar tendency, but it is difficult to say how much credit ought to be given them.

XANTHORRHÆA. See GRASS TREE.

XANTHOXYLUM, a genus of trees and shrubs, the type of the natural order *Xanthoxylaceæ*, an order closely allied to *Rutaceæ*, and chiefly distinguished from it by unisexual flowers, including more than 100 known species of trees and shrubs, having opposite simple or pinnate leaves with

pellucid dots, and no stipules, chiefly natives of warm climates, and more particularly of the warm parts of America. The order is generally characterized by pungent and aromatic qualities, which are strongly developed in the genus *X.* itself. *X. fraxineum*, a North American species, a very low, deciduous tree, with leaves somewhat like those of the ash, common from Canada to Virginia, is called **TOOTHACHE TREE**, from the use made of the hot acrid bark and capsules for the relief of toothache. It is also in high repute in the United States as a remedy for chronic rheumatism, for which it is administered in the form of a powder,

Xanthoxylum fraxineum.

in doses of from ten grains to half a drachm three times a day. Some of the species are popularly called **PEPPERS** in their native countries, as in India and Japan, where they are used as a substitute for pepper. The bark of *X. fraxineum* is a powerful sudorific and diuretic, and other species possess similar qualities; some are febrifugal, and the seeds and unripe capsules of some are gratefully aromatic.—To the order *Xanthoxylaceae* belong the **AILANTO** (q. v.) and the **WHITE IRON-WOOD** (*Vepris scandulata*) of the Cape of Good Hope, the wood of which is very hard and tough, and is much used for agricultural implements.

XANTHUS, the name of the capital of the ancient Lycia, anciently called Arina, a city of the Tramilia, or Solymi, the primitive inhabitants. It lies at the south-west corner of Asia Minor, and near the village of Kounik. From the earliest historic times to that of Cæsar, the Lycians appear to have been independent under native rulers; but after the fall of Sardis and the capture of Cæsar, the Persian conqueror Cyrus sent an army for the conquest of Lycia, led by Harpagus, in 546 B.C. The most desperate resistance was made by the Lycians, and the people of X. burned themselves in their citadel, rather than surrender to the conqueror, only 80 families surviving the catastrophe. Reduced to a Persian satrapy, they sent 50 ships to the expedition of Xerxes against Greece, and contributed to the revenues of Persia. Little is known of the history of this town till the days of Alexander the Great. Alexander took X., which is said to have made as determined a resistance as it did on the former occasion. In the war which ensued amongst the successors of Alexander, Ptolemy took X. from the garrison of Antigonus; and the city subsequently passed into the possession of the Ptolemies and

Seleucids. After the defeat of Antiochus, it was ceded by the Romans to Rhodes, but subsequently had its liberties restored. In the civil war between Brutus and the Triumvirs (43 B.C.), X. was taken by Brutus. The inhabitants a third time destroyed themselves and their families, and few survived the capture. From that time, X. belonged to the Roman Empire, and suffered in the earthquake in the reign of Tiberius; but Lycia did not lose all its freedom till the time of Claudius, who reduced it to a province. X. was situated 70 stadia, or 9 miles, from the sea, on the left bank of the Sibres or Sibrus, the Greek Xanthus, or Yellow River, on a plateau of elevated ground, of nearly rectangular shape, the elevated parts close to the river rising 200 feet. The most remarkable edifices in the city and its vicinity, according to ancient authors, were the Sarpedonion, or Temple of Sarpedon; that of the Lycian Apollo; and Letoon, or Temple of Leto. On the elevated ground, or Acropolis, stood the so-called Harpy Tomb, and an ancient theatre of Greek workmanship; while in the other part of the city which lay to the east was a mixture of Greek and Roman buildings. The whole city and its environs contained numerous temples and tombs. The discoveries of Sir C. Fellows in 1838 revealed the city of X., its temples and its monuments, and they appear to fall into the following classes: 1. The sepulchres of the early inhabitants, placed inside the wall in shape of square columns, with step-shaped bases, and sepulchral chamber on the summit. The most remarkable of these is the Harpy Tomb, so called from the subject of the bas-reliefs being the Harpies bearing off the daughters of Pandarus, king of Lycia—executed in a style resembling the earliest efforts of oriental Greek art. Another, with a frieze of lions and hunters in Persian style, and the inscribed obelisk, with long Lycian inscription and some Greek verses, apparently of the time of Artaxerxes Longimanus, and made about 466 B.C. 2. The tombs of the age of the Persian subjection, with roof-shaped tops and ridges, and imitation of woodwork, the sepulchral chamber for the principal dead being at the summit, the others in the middle and base, the sides ornamented with reliefs of a later style of art. Of a later style, but of more beautiful art, was the Ionic peristyle temple or monument of 14 columns, with a solid cella, placed on a base or pedestal, both temple and base ornamented with friezes, supposed to represent the conquest of Lycia by Harpagus, and with figures between the columns. The friezes represent hunts and feasts, the combats of Lycians and Persians, and taking of the city of X. by the latter—the whole treated in a style not unlike the school of Phidias and his successors. These sculptures have been supposed to represent the exploits of Harpagus, or the suppression of the revolt of the Cilicians by a Lycian satrap, and to have been made between 450 and 387 B.C. This temple was discovered by Sir C. Fellows in 1840—1844.

The language found on the monuments of Lycia, written in an alphabet of 25 letters, is an Aryan dialect, distinguished by a prevalence of vowels. The letters, with two exceptions, are archaic Greek, and borrowed from by no means the oldest form of that language. The syntax and inflections are Aryan Indo-European, but many of the roots are different from the languages of that family, although certain words may be referred to well-known equivalents—as *goda*, 'lord,' to the Persian; *tedeeme*, 'son,' to the Slavonic; and *ladé*, 'wife,' to the Anglo-Saxon. Some words, too, resemble the Zend. The presence of many Greek words barbarously transcribed can also be well recognised in the different inscriptions, and some few

derived from their Persian conquerors—as *geatrape*, or 'satrap.' The inscriptions are generally short and sepulchral, and follow the well-known formula commonly used under the Roman Empire, and are sometimes accompanied by Greek versions or translations, helping to explain the Lycian. One inscription alone, recording the exploits of one of the family of the Harpagi after the battle of Eurymedon (466 B.C.), on the so-called obelisk of X., is of any length. The language seems to have lasted from about the 5th c. B.C. to the 1st c. A.D.—Rawlinson, *Herodotus*, vol. i. pp. 311, 673; *Synopsis of the Contents of the British Museum*, 1855, p. 105; Fellows, *Asia Minor* (Lond. 1839); *Discoveries in Lycia* (1841); Birch in the *Archæologia*, vol. xxx. pp. 176—204.

XAVIER, ST FRANCIS, a celebrated missionary of the Roman Catholic Church, was born of a noble family at Xavier, in Navarre, April 7, 1506. Having received his early education at home, he was sent, when in his 18th year, to the college of Sainte Barbe, at Paris, where he formed the acquaintance of Ignatius de Loyola (q. v.), with whom he ultimately became associated in the foundation of the Jesuit Society. Under that head will be found detailed so much of his history as regards the first establishment of the order, and the early labours of its founders in Rome. It was while he was engaged in these early labours of the society in Rome, that X. attracted the notice of the representative of John III. of Portugal at Rome, Gouvea, who suggested to the king the idea of sending out members of the new order as missionaries to the Portuguese colonies in the East. X. was chosen for this purpose in the place of Bobadilla, who had been originally appointed, but was prevented by sickness from going on the expedition. Having sailed from Lisbon, April 7, 1541, and wintered at Mozambique, he arrived at Goa, May 6, 1542, and presented to the bishop his letters of authorisation from the Pope Paul III. X.'s first proceeding, on finding the excessively depraved condition of the European Christians settled in India, was to endeavour, by stirring up among them a spirit of penance and religious fervour, to remove the great obstacle to the efficacy of his preaching to the native population, which was presented by the evil example of the professing Christians of the colony. His efforts in this preliminary reformation were eminently successful, and he was equally blessed in his labours among the pearl-fishing population of the coast, from Cape Comorin to the island of Manasar. After a stay of more than a year in this region, he returned to Goa, and with a fresh staff of assistants, visited the kingdom of Travancore, where, in the space of a single month, he baptised 10,000 natives. Passing thence to Malacca, where he was reinforced by three other Jesuit missionaries, sent by Ignatius de Loyola in compliance with X.'s earnest solicitations, and having achieved great success among the residents of the coast, he proceeded, in 1546, to the Banda Islands, to Amboyna, and the Moluccas. In all these places his success was extraordinary. Having thus effected a first establishment of the Gospel in many places, he resolved to retrace his steps, and revisit the several scenes of his preaching. He arrived at Malacca in 1547, and thence by Manassar, near Cape Comorin, where he stayed for some time, he passed to the island of Ceylon, where he converted the king of Kandy, with many of his people. In May 1548, he returned a second time to Goa. His great object now was to carry out a project for the conversion of the Japanese Empire, which had been suggested to him by a Japanese of high rank, whom he had attached to himself at Malacca, and who accompanied him to Goa. This

Japanese, whom, with two of his domestics, he converted and baptised, became a most valuable auxiliary. Through his aid, X. was enabled during the voyage to acquire so much of the Japanese language as enabled him to translate into Japanese and explain the Apostles' Creed; and although his success in the first island which he visited was very insignificant, yet at Firando, and afterwards at Miako, his preaching was attended with extraordinary fruits. At the latter place, he had failed signally upon his first visit, which was made in a very poor and humble guise; but having returned with a more imposing train, and under circumstances of greater outward distinction, he obtained a ready and favourable hearing, and made so lasting an impression that the mission which he founded continued to flourish for above 100 years, until the final expulsion of Christianity from the Japanese Empire. His mission to Japan occupied about two and a half years; and in November 1551, he sailed from Amanguchi for the purpose of returning to Goa to organise a mission to China. Touching at Malacca, upon his voyage, he endeavoured to concert with the governor an embassy in the name of the king of Portugal, to China, under cover of which he hoped to effect an entrance for his missionary enterprise, but on his return from Goa to Malacca, he found a new governor, who was opposed to any such attempt; and he was obliged to adopt the expedient of sailing in a merchant-ship to the island of Sancian, near Macao, which was at that time the trading dépôt of the Chinese with the merchants of Portugal. From Sancian, X., having procured a Chinese interpreter, hoped to induce one of the native merchants to land him secretly on the coast; but in this hope also he was baffled by the fears of the Portuguese, who dreaded for themselves the vengeance of the Chinese authorities upon this infraction of the law. This disappointment, coupled with the privations and labours to which he had been exposed, brought on a violent fever, and under the combined weight of mental depression and physical sickness, this Christian hero sunk upon the very threshold of what he had looked to as the great enterprise of his life, in the island of Sancian on the 22d December 1552. His remains were conveyed to Malacca, and thence with great solemnity to Goa, March 15, 1554. Many miracles, attested by numerous witnesses, were reported of X. in almost all the stages of his career. Among these, there have been some who reckoned the miraculous gift of tongues. The evidence of these miracles was submitted to the usual process of inquiry at Rome, and many miracles having been established by the ordinary canonical process, X. was 'beatified' by Paul V. in 1619, and 'canonised' by Gregory XV. in 1622, his festival being fixed upon the 3d December. His only literary remains are, a collection of Letters, in 5 books, 8vo (Paris, 1631), and a Catechism, with some short ascetic treatises. His *Life*, by Père Bouhours, was translated into English by Dryden. There is also a Latin *Life* by Tursellino (Rome, 1594); and several in Italian, by Bartoli, Maffei, and others. The most recent English contribution to this interesting subject is that of Mr Venn.

XEBEC, an armed vessel of great speed, formerly used by the Algerine corsairs. It carried three masts, on which square or lateen sails could be set. The bow and stern were remarkable for the small angle they made with the water. The sides were low, and the upper deck of great convexity, that the water might readily flow off through the scuppers. As this rendered them inconvenient for walking on, gratings were laid at the sides of the deck, to avoid the convexity. The crew walked dry

on these gratings, while the water flowed out underneath. Xebecs carried from 16 to 24 guns.

Xebec.

A few of these vessels—unarmed—still sail the Mediterranean as carriers of perishable goods.

XENIA, a handsome and flourishing town in Ohio, U. S., and important railway junction, on the Little Miami River, 65 miles north-east of Cincinnati, the centre of a rich and populous agricultural district; it has a large court-house, jail, two newspapers, several churches. Pop. about 6000.

XENOCRATES, an ancient philosopher, was born at Chalcedon 396 B. C., and died 314. At an early age, he attached himself to Plato, and in course of time, was so much esteemed for his proficiency in philosophy and high moral character, that he was thought worthy of succeeding Speusippus, Plato's successor, in the presidency of the Academy. This post he filled most creditably for 25 years. He wrote numerous treatises upon dialectics, physics, and ethics, and drew with unusual precision the boundaries between these three departments of philosophy. Of these works, merely the titles have been preserved; and what is known of his doctrines is gathered only from notices of them contained in various authors. He introduced into the Academy, to a greater degree than before, the mystic Pythagorean doctrine of numbers, in connection with the *ideas* of Plato. Zeus, the father, ruling in heaven, he called Unity, as being uneven number and spirit; the World-soul, which operates through all things liable to motion and change, he styled Duality. This divine world-soul dwells in the heavenly bodies, the Olympic gods, the elements of nature, and also in terrestrial demons, whom he regarded as intermediate between gods and men. In his ethical teaching, he aimed at making the Platonic doctrines more directly applicable to ordinary life in individual cases, and pitched his standard of excellence very high. He held that virtue is in itself valuable, while other things are only so conditionally, and that it extended to thoughts as well as actions. He was himself of irreproachable character, of a well-balanced mind, and temperate in his habits without cynicism. His conversion of the youthful debauchee Polemo into an earnest, virtuous man, and his disregard for wealth, as shown by his refusal of the offers of Philip and Alexander, are the best known incidents in his long, useful, and virtuous career.

XENOPHANES, founder of the Eleatic School of Philosophy, was born at Colophon, in Asia Minor, about 560 B. C., or, according to others, about 40 years earlier. He spent the greater part of a life which

was prolonged beyond his 90th year, in banishment. He passed many years in Sicily, and resided for some time at Elea (whence adj. *Eleatic*), in Lucania. He composed many poems, historical, didactic, and elegiac, which have all perished, except a few fragments. He employed his poetry as the instrument for disseminating his philosophical tenets. He was the first to maintain the Eleatic doctrine of the oneness of the universe; and recognising clearly the unity and perfection of the deity, he attacked the prevalent mythology and the practice of attributing to the godhead a human form and human weaknesses. He was thoroughly in earnest, but his logic was confused and contradictory. While he held the existent to be identical with the deity, and regarded it as the basis of phenomena, he also maintained that the divine essence was neither finite nor infinite, neither moved nor unmoved: not finite, for then it must be limited by another, whereas God is one; nor, on the other hand, infinite, for only non-being is infinite, as having neither beginning, middle, nor end. The distinguishing tenet of X. is his Monotheism; and as a philosophical rhapsodist, he sought to inculcate it, though he failed to express it in a clear and systematic manner. His speculations are sceptical in their tendency, and appear to have had great influence upon succeeding philosophers. His explanations of physical phenomena were crude; but one is recorded in which he has anticipated modern geology. From the shells and marine petrifications found on mountains and in quarries, he inferred that the surface of the earth had risen gradually out of the sea. In the 18th c., Voltaire could give no better explanation of the fact of sea-shells being found on the mountains of Spain, than the supposition that they were the scallop-shells dropped by pilgrims journeying to and from the shrine of St James.

XENOPHON, celebrated as a general, historian, and philosopher, was born at Athens 445 B. C. At an early age, he became a pupil of Socrates, and is said to have been saved from death by that philosopher at the battle of Delium. At the age of 40 or thereabouts, he joined the expedition of the younger Cyrus against his elder brother, Artaxerxes Mnemon, king of Persia. After the battle of Cunaxa, and the treacherous massacre of the Greek generals, X. played an important part in the adventurous retreat known in history as the Retreat of the Ten Thousand; and it was his courage and conduct that contributed mainly to its success. After having returned to Asia Minor, X. led a portion of his forces upon a pillaging expedition, and amassed wealth enough to enable him to live the life of a country gentleman. Before retiring, he served under Agesilaus, the Spartan general, against the Persians; and at Coronea fought against his own countrymen. Sentence of banishment had been previously passed upon him at Athens, probably for his share in the Cyrean expedition. His sympathies were entirely Spartan. He soon afterwards settled at Scillus, a small town near Olympia, in Elis, under Spartan protection, where he lived upwards of 20 years, occupying himself with hunting, agriculture, and writing. He is not mentioned as having ever returned to Athens, though his sentence of banishment was repealed, and his two sons were in the Athenian division which aided the Spartans at Mantinea. At last, X. was driven from his retreat at Scillus by the Eleans, and took refuge in Corinth, where he probably died, 359 B. C. His works are numerous, and to judge by their titles and number, all extant. His style is simple, elegant, but rather monotonous and deficient in vigour. As a philosopher, he holds no very high rank. He possessed excellent practical talents, was a humane, sensible,

religious man, but seems to have had neither genius nor taste for speculative philosophy. His principal works are the *Anabasis*, or narrative of Cyrus's expedition, and the *Retreat of the Ten Thousand*; a *History of Greece* in continuation of Thucydides; the *Cyropædia*, or education of Cyrus the Elder—a sort of political romance, in which Cyrus is drawn as the model of a wise and good ruler. In the latter work, X. clearly shews his preference of a well-regulated monarchy to the democracy of his native country. He wrote besides, the *Reminiscences (Memorabilia)* of Socrates, a series of dialogues intended to refute the charges upon which that philosopher was executed; also treatises on Hunting, on the Horse, the Revenues of Athens, and Domestic Economy.

XERXES I. (the name is perhaps akin to Sanscrit *ksahtra*, king), king of Persia, was the eldest son of Darius and his second wife Atossa, and was appointed successor by his father, in preference to Artabazanes, his eldest son by his first wife whose children were all born before Darius became king. Darius died in the beginning of the year 485 B. C., in the midst of his preparations for a third expedition against Greece. X., after having subdued the rebellious Egyptians, and appointed his brother Achæmenes governor, gave his whole attention to the completion of the preparations begun by his father, which occupied nearly four years. Immense hordes of men were gathered together from all parts of the vast Persian Empire, from the steppes of Central Asia, from the banks of the Indus and its tributaries, and from the interior of Africa; an enormous fleet was furnished by the Phœnicians and other maritime nations subject to Persia; stores of provisions sufficient to support the immense army were collected at different points along the intended route of march. A bridge of boats, an English mile in length, under the superintendence of Egyptians and Phœnicians, was built across the Hellespont. The bridge, however, was destroyed by a storm, on which (according to the Greek historians) X. ordered the heads of the engineers to be cut off, and was so enraged at the rebellious and disrespectful sea, that he ordered 300 lashes to be administered to it, and a set of fetters to be cast into it. Another bridge, consisting of a double line of boats, was built; and a canal was cut through Mount Athos, at the point of the peninsula of Acte in Macedonia, on which the fleet of Mardonius had been wrecked in 492 B. C. The preparations were completed in 481 B. C., and in the autumn of that year, X. arrived at Sardis, where he wintered. In the spring of the following year, the vast assemblage began to march towards the Hellespont; and, according to Herodotus, it took seven days and nights to march across the bridge. After crossing the Hellespont, the march was continued along the Thracian coast towards Doriscus on the Hebrus, where a halt was made on a large plain, and the army numbered. The fleet drew up near to Doriscus. According to Herodotus, the whole number of fighting-men, military and naval, amounted to nearly 2,500,000, and the fleet consisted of 1207 ships of war, besides 3000 smaller vessels. These numbers were considerably increased during the march between Doriscus and Thermopylæ by the Thracians, Macedonians, Magnessians, and other nations through whose territories X. passed on his way to Greece. Herodotus supposes that the number of camp-followers, exclusive of eunuchs and women, would amount to more than that of the fighting-men; so that, according to him, the whole number of people assembled on this occasion would be considerably over 6,000,000, a number greater than the entire population of Ireland. This number is doubtless greatly exaggerated; still,

300

it cannot be doubted that this was one of the greatest multitudes ever brought together for any purpose under the sun. Grote, who discredits the immense numbers given by Herodotus, nevertheless says: 'We may well believe that the numbers of Xerxes were greater than were ever assembled in ancient times, or perhaps at any known epoch of history.' This immense force moved on without resistance through submissive nations till it reached Thermopylæ (q. v.), where it was brought to a stand by the army of Leonidas (q. v.). Although the Greeks were entirely defeated and slain, it was not without heavy loss to the Persians. On the same day, and on the third day after, the Persian fleet, which had previously suffered severely from a storm, was defeated with heavy loss by the Greeks off Cape Artemisium in Eubœa. X. continued his march on to Athens through Phocis, which he laid waste, and Bœotia, whose inhabitants joined him, with the exception of those of Plataea and Thespia, which cities he burned. A detachment which he sent to attack Delphi met with a signal defeat. When X. arrived at Athens (in the summer of 480, three months after crossing the Hellespont), he found the city deserted, the Athenians having sent their families to Trœzen, Ægina, and Salamis. Athens was destroyed. Meantime the two fleets had sailed round from Eubœa and taken up their positions in the narrow strait between Salamis and the Attic coast, where the famous naval battle of Salamis took place (September 480 B. C.). See SALAMIS. X. witnessed the fight from a lofty throne which he had caused to be erected on one of the slopes of Mount Ægaleus,

'The rocky brow
Which looks o'er sea-born Salamina.'

X. was apparently confounded at the unexpected and inglorious result of all his mighty preparations for the overwhelming of Greece, and becoming alarmed for his personal safety, fled, under an escort of 60,000 men, with all haste towards the Hellespont, which he reached in 45 days. The bridge of boats having been again destroyed by a storm, he crossed over to the Asiatic coast in a vessel. Mardonius was left with 300,000 men to carry on operations in Greece. In 479 B. C., the Greeks defeated Mardonius in the famous battle of Plataea (q. v.), and on the same day gained another victory over the Persians at Mycale in Ionia. Next year (478 B. C.), the Persians lost their last possession in Europe by the capture of Sestos on the Hellespont. The war was continued for a few years longer, though the struggle was now virtually at an end. Little more is known of the personal history of X., except that, in 465 B. C., he was murdered by Artabanus, who aspired to the throne, and was succeeded by his son Artaxerxes. From all that is known of X., he appears to have been utterly ignoble in character, vain-glorious, licentious, cruel, cowardly—the very *beau-ideal*, in short, of the worst kind of eastern potentate. His history would be scarcely worth recording were it not for his connection with Greek history. His famous invasion was undertaken apparently for no other purpose than to gratify a weak-minded vanity, which was delighted with the idea of being able to assemble at one time 'ships by thousands' and 'men in nations,' who were at the mercy of his unprincipled caprice.

XIMENES, FRANCIS DE CISNEROS, by which latter name he is commonly called in Spain, the well-known statesman, archbishop, and cardinal, was born of a humble family at Torrelaguna, in Castile, in 1437. He was educated at Alcalá de Henares, Salamanca, and finally Rome, where he obtained from the pope a provisional or prospective nomination to a prebend in the cathedral of Toledo.

The archbishop, resisting the papal claim of 'provisor,' refused to admit X.; and on his persisting in his claim, put him in prison, where he was detained for a long period. On his release, he was named Vicar-general of Cardinal Mendoza at Sigüenza; but he gave up this preferment, and entered the Franciscan order in 1482. His reputation for piety and learning, led the queen, Isabella, to choose him, in 1492, for her confessor; and three years afterwards, to name him Archbishop of Toledo—a dignity which he refused to accept until he received an express command from the pope. Having yielded in the end, he continued as archbishop the life of mortification and austerity which he had practised in his monastery; and he applied to purposes of religion, charity, and public utility the whole of the princely revenues of his see. As confessor and confidential adviser of the queen, X., during the lifetime of Isabella, was the guiding spirit of Spanish affairs; and on her death in 1504, he held the balance between the parties of Ferdinand and Philip of Burgundy, husband of Joanna, the heiress of the crown. On the death of Philip in 1506, X. was appointed Regent, in consequence of the incapacity of Joanna and the absence of Ferdinand, and conducted the affairs of the kingdom through a most critical time with consummate skill and success. In 1507, he was created Cardinal; and in the following year, he organised, at his own expense, and himself accompanied as commander, the celebrated expedition, consisting of 10,000 foot and 4000 horse, for the conquest of Oran, on the African coast. Ferdinand died in January 1516, and on his deathbed named X. Regent of Spain till the arrival of his grandson Charles; and although the grandees had organised an opposition as well to himself as to the royal authority, X., by his prompt and able dispositions, overawed them into submission; and subsequently, by the same exercise of vigour and determination, quelled the incipient revolt of Navarre. In order to the better consolidation of the royal authority in Spain, X. urged very strongly the speedy visit of Charles, who still lingered in his Flemish principality; but it was not till after the lapse of a year and a half, that the king decided on his journey; and meanwhile, the enemies of X. had so worked upon his jealousy and pride, that he took the ungracious and ungrateful course of dismissing his faithful, but, as he feared, too powerful servant. X. had set out to meet the king, and although labouring under great infirmities, continued to prosecute his journey, when he was seized with a mortal illness at Brangullas, near Aranda de Duero, where he died, November 6, 1517.

As a statesman and administrator, the reputation of Cardinal X. is deservedly of the very highest. The social and political revolution which he effected in breaking down the feudal power of the nobles, has often been compared with the analogous change wrought in France by Richelieu. But the revolution of X. was, at least in its results, rather in the interest of the people than, like that of Cardinal Richelieu, of the crown; and while it freed the sovereign from the unworthy position of dependence on the nobility, it established

the municipalities and the communal representatives in the enjoyment of certain well-defined and undoubtedly substantial privileges and immunities. His munificence as a patron of religion, of letters, and of art, has been the theme of praise in every history of his time. The university of Alcalá de Henares, which he planned, organised, erected, and endowed, was a marvel of enlightened munificence in such an age, and may compare advantageously with even the most princely foundations of the most enlightened times. His Complutensian Polyglot (q. v.), besides being the first of its class, was, considering the resources of the period, perhaps the grandest in conception among the projects of its own order; and the perseverance with which, during the long period of fifteen years devoted to its preparation, he watched and directed its progress, is an evidence that it originated from a genuine love of sacred learning, rather than a passing impulse of literary enthusiasm. The cost of this gigantic undertaking amounted, on the whole, to 80,000 ducats. His expenditure on churches, hospitals, schools, convents, and other works of religion and benevolence, was on a scale of corresponding munificence. He maintained thirty poor persons daily at his own cost, and he regularly set apart one half of his income to the uses of charity.—See Hefele's *Der Cardinal Ximenes und die kirchlichen Zustände Spaniens am Ende des 15. und Anfange des 16. Jahrhunderts* (Tübingen, 1851).

XYLOIDIN is a substance which is precipitated in the form of a white powder, insoluble in water, alcohol, and ether, when water is freely added to a solution of starch in cold nitric acid. Its composition is not determined with positive certainty, but it is probably starch, $C_{12}H_{10}O_{10}$, in which either one or two atoms of hydrogen are replaced by a corresponding number of atoms of peroxide of nitrogen, NO_2 . According to Professor Miller, there is a substitution of two atoms, so that the formula representing xyloidin is $C_{12}H_8(NO_2)_2O_{10}$. It explodes when sharply struck, and burns with violence at 356° . By the action of reducing agents, it is again converted into starch.

XYLOL (Gr. *xylon*, wood) is an oily aromatic fluid with a strong refractive power, and boiling at about 263° . Its composition is represented by the formula $C_{10}H_{10}$, and it is regarded as the hydride of a non-isolated radical, $C_{10}H_9$, to which the name *Xylol* is given. Xylol, mixed with toluol, cumol, and cymol, is found amongst the oils which are separated from crude wood-spirit by the addition of water.

XYLOPHAGA (Gr. wood-eaters), a family of *Coleoptera*, of the section *Tetramera*, nearly resembling weevils, but differing from them in the want of a beak. They have short antennæ, thickened towards the tips, and sometimes leafy from the base. The species are numerous, and are arranged in many genera. They mostly live in wood, on which they feed, both in their perfect and larval states. Some of them are very destructive to trees and timber. See BARK BEETLE and SCOLYTUS. Some of the X. live in fungi, and feed on them.

Y

THE last letter but one of the English alphabet, is derived from the Greek Υ (υ). It had no place in the earlier Latin alphabet, and only came into use by Roman writers in the time of Cicero in spelling words borrowed from the Greek. In the Greek of the classical age, Υ (Υ) no longer retained its pristine power (Ital. u or Eng. oo), but had degenerated into a sound like the French u , or even nearer to i (ee); it could not therefore be represented by the Roman u or v , which had remained (and remains yet in modern Italian) undegenerated, and thus was appended to the Roman alphabet as a new character. Its use in native Latin words, as *sylva* for *silva*, *satyra* for *satira*, is an error of modern editors. Italian has no y , but uses i instead, as *sinfonia*, symphony. The other modern languages of Europe have not only retained it in spelling words of Greek origin, but some of them substitute it for i in native words, generally in a very capricious manner. German orthography has recently been purged of this abuse; and in Dutch, where it had always the sound of English i (ai), the double character ij is now written. In English, it is used to represent the semi-consonantal power of i or j (see I and J) in the beginning of a word and before another vowel, as *yoke* = Lat. *iugum* or *jugum* = Ang.-Sax. *iuc*; *young* = Ang.-Sax. *iong* = Ger. *jung*. It has been suggested that the practice of writing y at the end of a word instead of i , while we replace it by i on adding a syllable (e. g., *lovely*, *lovelier*), may have arisen like the habit of giving a tail to the last unit of the Roman numerals (e. g., *ij*, *iiij*), in the wish to give a kind of finish to the word and please the eye. The would-be antique spelling y , y' , for *the*, *that*, is a blunder, arising from mistaking the Ang.-Sax. β (= th) for a y .

YABLONOI MOUNTAINS, a name that has long had a place in the geography of the north-east of Asia, designating a range of mountains which are found to have no existence, the locality in which they were supposed to be placed being an undulating plateau.

YACHT is a small vessel constructed so as best to insure strength, elegance, and speed, and exclusively employed for pleasure-sailing. Vessels of this sort were first constructed in this country in 1604, at which date a yacht was built by the king's master-shipwright for Henry, eldest son of James I. of England; the idea of such a vessel being taken from the Dutch, among whom they had been employed for some time previous. From this time, yachting, steadily patronised by royalty, became a favourite pastime of the nobility and gentry, and is now so general, that there are no fewer than 30 yacht clubs in the United Kingdom, possessing 1200—1300 yachts. This amusement is encouraged by government, mainly because it supplies an excellent training for seamen, who in time of war become available for the royal navy, while in time of peace they are no burden on the

national treasury; and accordingly, yachts are allowed to bear the ensign of the royal navy, supplemented by the special flag granted by the Admiralty to each club, and to refit and revictual in the royal dockyards. The oldest yacht club in the United Kingdom is the *Royal Cork*, which, under the title of the 'Water Club of Cork,' is known to have existed as early as 1720; and the next in order of seniority is the *Royal Yacht Squadron*, founded in June 1815, and having its headquarters at Cowes, Isle of Wight. The club which stands first as to the number of its members and yachts is the *Royal Thames Yacht Club*, which was founded in 1823, and has its headquarters in London. Of the other clubs in this country, 3 belong to Scotland (2 to Glasgow, and 1 to Edinburgh), 4 to Ireland (1 to Queenstown, 1 to Kingstown, 2 to Dublin Bay), and the rest to England, being mostly located on the Thames, the channels between Southampton and the Isle of Wight, or along the north coast of Wales, from Liverpool to Holyhead. Half of these clubs have been founded since 1840. Yachting is gaining ground in foreign countries and in the British possessions, the United States ranking next to Great Britain and Ireland in the number and importance of her yacht clubs (the chief of which is the New York Yacht Club); and Holland, Belgium, France, Australia, Bermuda, Canada, and Russia have similar associations.

The principles adopted in the construction of yachts have fluctuated greatly, from the simple unpretending rig, small tonnage, and clumsy build of the early yachts of the Royal Cork Club, to the immense canvas area, larger size, and long narrow build of the yacht of the present time. The yacht of the early part of the century was built with a fine run aft, and a bluff bow; but about 20 years ago, this style was supplanted by increased sharpness of bows and stern, a raking (slanting upwards and backwards) stern-post, more depth, the draught aft double of that forward, great fineness of the water-lines, narrow beam, and immense sails. The effect of these changes was a great increase of speed, attended, however, with certain defects: one of which was that the diminished breadth of beam injuriously affected buoyancy, and the yachts consequently were more liable to be wetted in a heavy sea. In 1851, the hollow manner in which the crack yachts of the principal clubs in England were beaten by the yacht *America* of the New York Yachting Club, shewed their owners and builders that they had still much to learn in the way of improvement; and with few exceptions, they wisely took the lesson. The *America* had great breadth of beam, comparatively little depth inside, an upright stern-post, extremely sharp entrance, and fine water-lines, and (the most remarkable feature) her maximum breadth considerably abaft the centre. With the exception of the great breadth of beam, and little depth inside, all the other characteristic points of the American yacht were adopted by the builders of yachts in this country; the difference between the

draught aft and forward was diminished; and the result of these changes has shewn that they were great improvements.

The materials used in the building of yachts are wood, iron, and steel; wood alone, wood and iron together, iron alone, and steel alone, being the various ways in which the materials are employed. Yachts built of wood, or of wood and iron, are generally coppered, to protect the planking, and secure the smoothness of surface essential to speed. The considerations which determine the relative length, breadth, depth, &c., are treated of under SHIP-BUILDING. Considerable stimulus is given to improvements in construction by the numerous prizes which are offered for competition by the various yacht clubs, and which amount to about £7000 annually. These small, but powerfully built, and thoroughly sea-worthy vessels have traversed every sea on the globe; numbers make trips to Norway and the Mediterranean; a few visit America and the Indian and Southern Oceans; and one or two have circumnavigated the globe. Some of the most remarkable performances of yachts are the voyage from New York to Liverpool of the *Charter Oak*, 23 tons, in 36 days; that of the *Sylvie*, 205 tons, from Halifax to Havre, in 16½ days; those of the *Inca*, *Katinka*, and *Vivid*, 25 tons each, from England to Australia; and the great Atlantic yacht-race from New York to Cowes, in December 1866, which was won by the *Henrietta*, 205 tons, after a voyage of 14 days. Yachts may be divided, according to the style of their rig, into Cutters (q. v.), fore-and-aft and square topsail Schooners (q. v.), and Yawls (q. v.). The tonnage of these vessels is very variable, ranging from 3 to 420 tons in Britain, the average tonnage being 30—50 tons. There are also steam-yachts belonging to the various clubs, but they are too insignificant in number to require more than mention. The *Victoria and Albert* and the *Fairy*, both belonging to her Majesty, are specimens of this class.

YĀJNAVALKYA is the reputed author of the *S'atapatha-Brahman's* (see *Yajurveda*, under VEDA), and of a *Dharmas'āstra*, or law-book (see SANSCRIT LITERATURE, sec. Law). His name points to his being a descendant of Yajnavalka; and, according to tradition, he was also a descendant of *Vedvadmītra* (q. v.), and belonged to a branch of the *Kusikas*. He seems to have occupied an influential position at the court of King Janaka of Videha. Nothing certain, however, is as yet known regarding the age at which he lived.

YAK (*Bos grunniens*), a species of ox found in Tibet, and domesticated there. It is ranked by Colonel Hamilton Smith in the genus *Bison*, along with the Bison, Gaur, and Gayal, and by Mr Gray in the new genus *Poëphagus*. The wild yak of Central Asia is the largest native animal of Tibet, and is found only near the limits of perpetual snow, descending into the higher wooded valleys in winter, and ascending in summer to the pastures of short grass and carices, some of which are at an elevation of 17,000 feet above the sea. It is hunted by large dogs, and is very fierce, falling upon an adversary not only with its horns but with its chest, and crushing him by its weight. It is generally black. The yak has been domesticated from time immemorial, and forms great part of the wealth of the inhabitants of the highest and coldest regions of Central Asia. The domesticated yak is about the height of an English ox, which it much resembles also in figure of body, head, and legs. It is covered all over, however, with a thick coat of long silky hair, hanging down like the fleece of a sheep. The head is rather short; the eyes large and beautiful; the horns not very large, spreading,

tapering from the base, a little turned back at the tips, a space between them on the forehead covered with a mass of curling hair; the nose is smooth and convex, the nostrils small. The neck is short; the withers high and arched; the rump is low; the legs are short. Over the shoulders there appears a bunch somewhat like that of the zebu, but it consists only of long hair. The hair of the whole ridge of the back is long and erect, but not harsh. The tail is covered with a prodigious quantity of long flowing hair, descending to the hock, and has much

Yak (*Bos grunniens*).

the appearance of a large bunch of hair artificially attached. Not a joint of it is visible. From the chest, between the fore-legs, issues a large pointed tuft of long hair. The hair of the shoulders, rump, and upper parts of the body is comparatively thick and short; but that of the lower parts is long and straight, hanging below the knee, and sometimes even to the ground. Yaks exhibit great variety of colours; but black and white are the most prevalent. It is not uncommon to see the long hair on the ridge of the back, the tail, the tuft on the chest, and the legs below the knee white, whilst all the rest is jet black. The great quantity of hair, evidently a protection against the cold of the climate for which it is destined, gives the yak an apparent size far beyond the reality.

The yak does not low like an ox, but utters a short grunting sound like a pig, as the expression either of uneasiness or of satisfaction.

It delights in steep and rocky places. Hooker, in his *Himalayan Journal*, describes the calves as 'the drollest of animals, like ass-calts in their antics, kicking up their short hind-legs, whisking their bushy tails in the air, rushing up and down the grassy slopes, and climbing like cats to the top of the rocks.' The yak is capable of becoming very tame. The Tibetan girls call the yak cows by a peculiar cry to be milked.

The milk of the yak is very rich, and the curd made of it is much used by the Tibetans, both fresh and dried, often powdered into a kind of meal. The butter made from yak-milk is excellent, and is preserved for a long time in the dry and cold climate of Tibet in bladders. It is an important article of Tibetan commerce. The flesh of the yak is of the finest quality; that of the calves is much superior to ordinary veal. Yak flesh is often dried in the sun by the Tibetans, and eaten raw. The yak is never used for tillage or draught, but is very much employed as a beast of burden, and travels at a slow pace twenty miles a day, where no other beast of burden could well be employed. The lazy and luxurious lamas of Tibet often ride upon it, an attendant leading the animal. The hair is spun into ropes, and made into coverings for tents. The soft fur on the hump and shoulders is made into a

fine and strong cloth. Caps, jackets, cloaks, and blankets are made of the skin with the hair on. The tails are the *chowries*, or fly-flappers, used in all parts of India, and which are to be seen particularly on all occasions of state and parade, and sometimes in the hands of the meanest of grooms, sometimes of the highest officers of state.

There is much reason to think that the yak deserves a degree of attention which it has not yet received. It is still confined to its native region, whereas it is probably adapted to increase the productiveness and wealth of many parts of the world. It seems extremely suitable to Norway, Iceland, and other northern countries, and perhaps might be advantageously introduced into the Highlands of Scotland. Its hair is probably fit for other textile purposes than those to which it has been applied by the rude Tibetans.

YAKSHA is, in later Hindu Mythology, the name of a kind of demigods, who especially attend on Kuvera, the god of riches, and are employed in the care of his garden and treasures. According to the *Vishn'u-Purān'a*, they were produced by the god Brahma, as beings emaciate with hunger, of hideous aspect, and with long beards; but Brahmanic poetry generally represents them as inoffensive, and in the *Meghadūta* of Kālidāsa (q. v.), it is a Yaksha banished from his wife who utters the most poetical thoughts, and is capable of the tenderest feelings. The Buddhists, on the contrary, describe them in some of their legends as cruel demons, who feast on serpents and human corpses, and when filled with the flesh they have devoured, indulge in fierce combats; but in others, again, as beings who also delight in dances, songs, and amusements, and sometimes even enter the paths that lead to *nirvān'a*. In Buddhist legends, they also possess the power of raising storms, and altogether occupy a far more prominent position than is allowed them in the Brahmanic pantheon.—See E. Burnouf, *Introduction à l'Histoire du Bouddhisme Indien* (Paris, 1844); the same author's translation of *Le Lotus de la Bonne Loi* (Paris, 1852); and Spence Hardy's *Manual of Buddhism* (Lond. 1853).—The Yakshas of the Brahmanic mythology have wives, Yakahts, who sometimes appear in the train of Umā (q. v.).

YAKUTSK. See JAKUTSK.

YALE COLLEGE, an institution of learning in New Haven, Connecticut, U. S., founded in 1700 as the collegiate school of the colony of Connecticut, under the trusteeship of the ten principal ministers of the colony, who each contributed a gift of books. It was first established at Saybrook, and in 1716 removed to New Haven. Among its early patrons were Governor Yale, whose name it bears, and Bishop Berkeley. Of its four faculties, the medical was founded in 1813, the theological and legal in 1822, and the scientific in 1846. Its government consists of the governor of the state, six senators, its president, and ten ministers. The library has 40,000 vols.; the libraries of two literary societies, 12,000 vols. each. There is a geological and mineralogical cabinet of 30,000 specimens, and the college has the historical pictures and portraits of Trumbull. It has 45 instructors, 600 students, and has had nearly 7000 graduates.

YAM (*Dioscorea*), a genus of plants of the natural order *Dioscoreaceae*, distinguished by an inferior ovary and membranous winged fruit. The species are mostly tropical, natives of the East and West Indies, &c. They have tuberous roots and herbaceous twining stems. The great fleshy roots of some of them are very much used as an article of food, in the same way that potatoes are in more temperate climates. They contain much starch, and

generally become somewhat mealy and pleasant to the taste when boiled. This, however, is not the case with all: the roots of *D. triphylla*, *D. demoum*, *D. virosa*, and several other species with ternate leaves are very nauseous even when boiled, and are poisonous. The tubers of all the yams contain an acrid substance, which, however, is dissipated by boiling, except in the species with compound leaves. The WINGED YAM (*D. alata*) is an article of food in daily use in the South Sea Islands. The roots are 1½–3 feet long, and often 30 lbs. in weight, with a brownish or black skin, juicy and reddish within. They vary exceedingly in form. The stem, which is winged, twines up tall poles which are provided for it by the cultivator; the leaves are between heart-shaped and arrow-shaped. Two or three small tubers are generally found in the axils of the leaves. It is supposed that this species may be the original of most, or perhaps all, of the yams cultivated in the tropical parts of Asia, Africa, and America—as the Common Yam of the West Indies (*D. sativa*),

Common Yam (*Dioscorea sativa*).

which has a round stem and heart-shaped leaves; *D. bulbifera*, in which the tubers in the axils of the leaves attain the size of apples; the Prickly Yam (*D. aculeata*), which has a prickly stem, and a fasciculated, tuberous root; *D. globosa*, the most esteemed yam of India, which has very fragrant flowers, and roots white internally; *D. rubella*, another Indian kind, with tubers sometimes 3 feet long, tinged with red below the skin; &c. The species are not well ascertained. Yams are propagated by means of their tubers; the small axillary tubers, or the small tubers produced at the base of the stem around the neck of the large tuber, being used for this purpose.—A species of yam (*D. Batatas*) has recently been brought from the temperate parts of China, where it appears to have been long in cultivation, and is found to succeed well in France. It is hardy enough to endure the climate even of Scotland without injury; but the heat of the summer is not sufficiently great and long-continued for its profitable growth, so that, in general, the plant merely lives, without producing a large tuber. The root is of very fine quality, and attains a very considerable size. The stem requires the support of a pole, round which it twines; the leaves are more elongated and acuminate than those of the West Indian yams; the root strikes perpendicularly down into the ground, and forms its tuber often at a very considerable depth, which is sometimes

inconvenient to the cultivator; but this is prevented by putting a slate under it.

YAMA, the Hindu god, who, at the epic and Purān'ic period of Hinduism (see INDIA, sec. Religion), is the sovereign of the Manes, and the judge of the dead, is, in the hymns of the R'igveda, a son of *Vivas'wat* and *Saran'yā*, and a twin-brother of *Yami*, whose desire to become his wife he resists. His father is sometimes also called the *Gandharva*; and he is further represented there as possessing two four-eyed dogs, which guard the road to his abode (see J. Muir, 'Yama and the Doctrine of a Future Life, according to the R'ig-, Yajur-, and Atharva-vedas,' in the *Journal of the Royal Asiatic Society*, New Series, 1865, vol. i. p. 287, ff.). The idea represented by these mysterious deities has been differently understood. Professor Roth takes *Vivas'wat* for the light of heaven, *Saran'yā* for the dark storming cloud, and Y. and *Yami* as representing the first human pair—the originators of the race, or the Vedic Adam and Eve produced by the union of the damp vapour of the cloud and the heavenly light. The Vedic hymns, however, do not afford the slightest ground for such a fantastical interpretation of these names; and as regards that of Y. and *Yami*, they discountenance it even distinctly by describing Y. as resisting the sexual

Yama.

alliance with his sister. Professor Max Müller understands *Vivas'wat* to represent the sky; *Saran'yā*, the dawn; Y., the day; and *Yami*, the night (*Lectures on the Science of Language*, 2d Series, Lond. 1864, p. 509, ff.). But this interpretation, too, is open to the strongest doubts, inasmuch as there is no valid ground for identifying the luminous deity *Vivas'wat* with the sky, or *Saran'yā* (from *saras'a*, going, moving) with the dawn. It seems more probable that the phenomena symbolised by this myth are not of a luminous, but of an aerial character; the kindred myth of a luminous character being that of the *As'wins*, who are likewise the twin progeny of *Vivas'wat* and *Saran'yā*, or rather of *Vivas'wat* and 'a form similar to that of *Saran'yā*,' and who represent the transition from darkness to light, and the inseparable duality produced by the intermingling of both (see J. Muir, 'Contributions to a Knowledge of the Vedic Theogony and Mythology, No. 2,' in the *Journal of the Royal Asiatic Society*, vol. ii. 1866). For as *Vivas'wat*, 'the expanding,' probably implies the firmament 'expanding' to the sight through the approaching light, *Gandharva*, as usual, the solar fire, and *Saran'yā*, the dark and cool 'air' (the

moving element), Y. and *Yami* seem to represent the current of air produced by the effect of the solar heat emanating from the firmament on the cool air of the night, when the antagonism between the warm and cold air of which this current consists would be Y. repelling the union with his sister *Yami*, though, at the same time, they are 'husband and wife while yet in the womb' (of the night-air). And since this phenomenon extends over the whole atmosphere, the two four-eyed watch-dogs of Y. are probably the eight or twice-four regions of the compass, either each couple of them taken together with their intermediate regions—whence both dogs are called spotted—or the four regions of the intermediate four taken separately—whence one dog is also called *dark*, and the other *spotted*. Y. being produced by the solar heat, it becomes then intelligible why it is said of Agni, the (solar) fire, that he is born as Y., and Y. being a phenomenon of the air, why he is also identified with *Vāyu*, the wind, and why the intermediate space between heaven and earth is assigned to him as his domicile. It is probably a later conception of the Vedic period which describes this abode as having been made for him by the spirits or *Manes*, and Y. as having been the first who found his way to it; and a still later one, which represents him as the first of *mortals* who went to that world, for in passages where these ideas are expressed, there is an association between the moving air and departed life which is foreign to the oldest notions of the Vedas. It led to the position which subsequently Y. assumed as a luminous king who dwells together with the Manes, and as the lord of Death—death then becoming his messenger. Yet in the R'igveda, he has not yet the office of judge of the dead which is assigned to him in the later mythology of the epic poems and Purān'as, and probably already in some of the Upanishads. At the epic and Purān'ic period, Y. entirely loses his cosmical character, though he is still called the son of *Vivas'wat*. He then marries 13 daughters of the patriarch *Dakaha*, is installed as the king of the Manes, becomes the regent of the South, and resides in *Yamapura*, a town of the infernal regions, where he sits in judgment over the souls of the departed which are brought before him. They are generally fetched by his messengers, who draw them with nooses out of the bodies which they animated; but in the case of very pious persons, he assumes himself the function of separating the soul from the body. After the soul has been brought before him, he orders his recorder, *Chitragupta* or *Chandragupta*, to read to him an account of all the good and bad actions it had done during its life, and which are kept registered in a book called *Agrasandhāni*; and according to their merit or demerit, it is sent to heaven or the infernal regions. The precise knowledge which the Purān'as pretend to possess of all these proceedings, also extends to the description they give of this recorder, and to their enumeration of the assessors who co-operate with Y. at his court.—Y.'s sister is *Yamunā* (q. v.). Amongst his other names, *Dharma* ('justice'), *Dharmarāja* ('king of justice'), *Antaka* ('the ender'), *Kāla* ('time'), and *S'rāddhadeva* ('the god of the S'rāddha,' q. v.), are of usual occurrence.—When represented, he is of grim aspect; his colour is green, his garments red, and he rides on a buffalo with a crown on his head, in one hand holding a club, and in another the noose.

YAMBU, or YEMBO (*Iambia* of Ptolemy), a maritime town of Arabia, on the coast of the Red Sea, about 130 miles south-west of Medina, stands on the edge of a barren plain that extends between the mountains and the sea, fronting the northern extremity of a narrow winding creek. It shares

with other places the title of 'Gate of the Holy City,' and is the third quarter of the caravan road from Cairo to Mecca, and is thus a place of considerable importance. Y. being the port of Medina, is supported by a considerable transport-trade and extensive imports from the western coasts of the Red Sea. The harbour is good and well sheltered. It is surrounded by walls with turrets, outside of which are a few domes and tombs. The streets are wide, the houses stand at a considerable distance from each other, are built of limestone and coralline, and have huge hanging windows. There is a large market-place, a custom-house, some white-washed mosques of a very simple form, and a few caravanserais. According to Burton, 'there is an independent bearing about the people, strange in the East; they are proud without insolence, and look manly without blustering. Moreover, the population has a healthy appearance.' Pop. between 6000 and 7000. See Burton's *Pilgrimage to El-Medinah and Meccah* (1855).

YAMUNÁ, the modern Jumna, is one of the sacred rivers of the Hindus, mentioned as such as early as in the hymns of the *Rigveda*. Bathing in it, especially where it falls into the Ganges, at Allahabad, was at a later period, and is now, supposed to have the efficacy of removing sin, because at Allahabad the god Brahma is said to have performed a great horse-sacrifice—whence this place is termed *Prayāga*, literally, 'sacrifice,' or *Bhat'a-prayāga*, literally, 'the best sacrifice.' (Though Allahabad, which is a celebrated place of pilgrimage, is the *Prayāga*, this term is also applied to other places where two sacred rivers meet, four of which, situated at the confluence of the Ganges with the Alakanandā, Pindar, Mandākinī, and Bhāgrathi, are, besides Allahabad, held in especial sanctity, and severally called *Nanda*, *Karnā*, *Rudra*, and *Devā-Prayāga*.) In the Purānic mythology, the Y.—in Sanscrit, a word in the feminine gender—is called a sister of the god *Yama* (q. v.); and a legend is also told in regard to her, according to which Balarāma, the brother of Krīshn'a (see *VIṢṆU*, the 8th Avatāra), once ordered the river to come to him, and as she disobeyed his bidding, plunged his ploughshare into her banks, and dragged her to him. Y., the legend continues, was thus compelled to quit her ordinary course, and to follow Balarāma whithersoever he went. At last, however, appeased by her entreaties, he let her go, after she had watered all the country. Professor Wilson appends to this legend, where occurring in his translation of the *Viṣṇu-Purāna*, the following remark: 'The legend probably alludes to the construction of canals from the Jumna, for the purposes of irrigation; and the works of the Mohammedans in this way, which are well known, were no doubt preceded by similar canals dug by order of Hindu princes.'—*Viṣṇu-Purāna* (Lond. 1840, p. 572).

YANG-TZE-KIANG, 'son of the great river' or 'sea,' the principal river of Asia, the 'girdle of China,' connecting together all the central provinces of that empire situated between Tibet and Kokonor on the west and the Pacific Ocean on the east. Its entire length through all its numerous windings, under its various names, can hardly be less, but rather more than 3000 miles. If regard be had to its tributaries and to the cities to which its waters give access, to the richness of the soil, and the variety of the products along its banks, and above all to the vast population scattered far and wide over the valleys, and plains, and hill-sides drained by it and its confluents, the Y. has no equal on the globe. It takes its rise in the same elevated regions of Central Asia which give birth to the Brahmaputra,

Makiang or Mekong, Salween, and Hwang-ho or Yellow River. Its course at first is southward, winding its way through an apparently level country, and bearing the name *Mura Ussu*, or Tortuous Waters. The magnitude of the stream must be considerable even in these upper regions, for it was here, beyond the Bayan Khara Mountains, that the missionary traveller, M. Huc, in the winter of 1845, saw a herd of wild oxen that had perished, having got frozen up in the ice while attempting to cross the river. Leaving these upper regions, after traversing the wide territory of Kokonor, the Tortuous Waters run southward, and enter the province of Yun-nan at about 28° N. lat. The river then flows in a south-east direction through this province, and at about 26° N. lat. and 103° E. long, it turns north, forming part of the boundary between the provinces of Yun-nan and Sze-chuen. After entering the latter province, it flows in a north-east direction under the name of *Kin-sha-kiang* (River of Golden Sands), receiving at this part of its course many tributaries. On the south, the tributaries of the provinces of Yun-nan and Kwei-chow are numerous, but not large; the principal one, the Oo or Woo, flows through the latter. On the north, the tributaries are numerous and large, the principal being the Ya-loong, the Min or Wen, and the Kia-ling, which force their way through narrow passes, rolling over lofty precipices, and carrying with them large masses of ice. Two of these rivers are each more than 1000 miles in length. It enters the province of Hu-pe at about 110° E. long, shortly before which it receives the name of *Ta-kiang* (Great River). The Great River next runs east-by-north through the entire length of the province of Hu-pe, receiving in its progress the waters of many lakes and rivers, the principal being the *Han-kiang*, from which the most illustrious dynasty takes its name, which in turn gave to Chinamen the name of which they are most proud—Sons of Han. The two provinces Hu-pe and Hu-nan—i. e., 'North of the Lakes' and 'South of the Lakes'—contribute, by natural or artificial channels, to augment the main stream. One of these lakes, the Tung-ting-hu, is the largest in China, having an area of 300 sq. miles. After receiving the waters of these lakes, the river proceeds in a north-eastern course through the province of Ngan-hwui, in which part are situated the cities forming the great mart Han-kow. Skirting the north of the province of Keang-se, it receives the waters of the Po-yang Lake, which receives nearly the whole of the waters of the province of Keang-se, and, like the Tung-ting-hu, pours all its contents into the Great River. Thence moving in a north-east direction, it becomes broader and deeper as it traverses the province of Ngan-hwui, receiving tributaries from both banks. Entering Keang-su, and passing Nankin, it travels southwards, intersecting the 'Transport River,' or Yun-ho—i. e., the Grand Canal. Through the whole of this province it receives tributaries, helping to swell the flood of waters, till in one broad expanse, several miles in extent from north to south, they disembogue into the Yellow Sea. To name the cities on the banks and tributaries of this rival of the Mississippi, would be to enumerate a large portion of the cities of the empire. It is navigable by ships of the largest class to 900 miles from its mouth, and for smaller vessels to upwards of 1500 miles. There is a large steam traffic on it up to Han-kow, nearly 700 miles from its mouth. By the treaty of Tien-tsin, the Y. was opened to foreign commerce as far as Han-kow; and speedily English and American steamers were found plying between Shang-hae and Han-kow.—Dr Bridgman in the *North China Herald*.

YANINA. See JANINA.

YANKEE, YANKEE DOODLE. Yankee, the popular name for a New Englander in America, and in Great Britain often applied indiscriminately to the whole population of the United States, was in its origin a corruption of the word English as pronounced by the Indians (Yenghies, Yanghies, Yankees). It seems to have been first applied about 1775 by the British soldiers as a term of reproach to the New Englanders, who themselves afterwards adopted it.—Since the War of Secession, the Southern population apply it to the Northern people generally.

The air known as *Yankee Doodle* was originally *Nankee Doodle*, and is as old as the time of Cromwell, to whom, under that name, the doggerel words belonging to it seem to have had a reference. It was known in New England before the Revolution; and one account of its appropriation in America, as a national air, is that after the battle of Lexington, the brigade under Lord Percy marched out of Boston, playing it in derisive allusion to the then popular nickname of the New Englanders; and that afterwards the New Englanders, saying that the British troops had been made to dance to *Yankee Doodle*, adopted the air as they had adopted the nickname. The citizens of the United States do not now recognise *Yankee Doodle*, but *Hail, Columbia*, as their national air.

YAPOCK (*Cheironectes palmatus*), a marsupial quadruped of the Opossum family, *Didelphidae*, the only known species of its genus. It differs from the opossums in having only five molars on each side of each jaw, in its aquatic habits, and its incapacity for climbing trees. The muzzle is rather sharp; the ears naked and rounded; the tail long, scaly,

Yapock (*Cheironectes palmatus*).

and prehensile; the feet webbed; the hind-feet with an opposable thumb. The Y. inhabits Brazil and Guiana. It is rather larger than a rat. It is of a brown colour, with three transverse gray bands, white on the under parts. It feeds on crustaceans, fishes, &c. It has cheek-pouches, in which it stows away its food.

YAR, or YARE, a river of the county of Norfolk, rises about the middle of the county, flows east past Norwich, and, receiving the Waveney, widens into the estuary of Breydon Water, is joined by the river Bure at Great Yarmouth, $2\frac{1}{2}$ miles below which it enters the North Sea, after a course of about 30 miles.

YARD (A.-S. *geard*, *gyrd*, Ger. *gerte*, a rod or wand), the British standard measure of linear dimension (see WEIGHTS AND MEASURES), is subdivided into feet and inches. The yard contains 3 feet, and each foot 12 inches. The terms 'yard' and 'ell' (the ell being, however, equivalent to $1\frac{1}{2}$ yards) are frequently (*commonly*, according to *Recorde*) used synonymously by old authors.

YARD, in the rigging of a ship, is a timber which, when in its normal position, is borne horizontally

at right angles to the ship's length at one of several heights on a mast, for the purpose of sustaining and spreading a square sail. It is upheld by the 'lifts,' and trimmed out of its right angle to suit the wind by the 'braces.' The lower sails or courses are upheld by the main, fore, or mizzen yards. Above these are the topsail-yards, the topgallant-sail-yards, and the royal-yards.

YARKA'ND, or YERKIANG, the capital of Little Bokhara, or Eastern Turkestan, in lat. $38^{\circ} 19' N.$, long. $76^{\circ} 10' E.$, on a river of the same name, a branch of the Tarim (see TURKESTAN). It is surrounded by stone walls three miles in circumference, having extensive suburbs, with a supposed pop. of above 200,000. The houses are built of dried bricks, the streets are intersected by numerous canals, and an extensive commerce imparts to them an animated appearance. This province being the place to which Chinese criminals are banished, there is a large convict population in Yarkand. It is the chief emporium of the commerce between China and the countries beyond the western frontier of the empire. The principal articles of trade are horses, silk, wool, copper, and jade. Jade is obtained from the river in large pieces—yellow, white, black, and reddish.—*Chinese Repository*.

YARMOUTH, GREAT, a municipal and, until 1867 when it was disfranchised for corruption, a parliamentary borough returning two members to parliament, an important seaport, and fishing and sea-bathing town, on the east coast of Norfolk, 19 miles directly east of Norwich, and $20\frac{1}{2}$ by railway. It stands about $2\frac{1}{2}$ miles above the mouth of the river Yare, on a slip of land about a mile and a half broad, washed on the west by the Yare, and on the east by the North Sea. Between the town and the suburb of Southtown, or Little Yarmouth, on the right bank of the Yare, in Suffolk, communication is established by means of a bridge. Connected with Southtown is the village of Gorleston, near the mouth of the river. The principal streets of Y. run parallel to the river, and are intersected by 156 cross lanes or 'rows,' which, as a rule, are so narrow as to be impassable for ordinary wheel-carriages, being generally not more than from 5 to 8 feet wide. The vehicles by means of which traffic is carried on in the rows, are called 'Yarmouth carts.' They are low, narrow, and well suited for conveying heavy goods. A quay of nearly two miles runs along the river, and here are the town-hall, the council-chamber, and several other handsome buildings—the finest houses, however, being those built along the esplanade on the beach. There are many churches, schools, and other public buildings, including a sailor's home, fisherman's hospital, and military asylum, the principal church being that of St Nicholas, founded in the 12th c., a handsome cruciform building with a tower and spire 168 feet high. The town also contains a monumental column 144 feet high, to the memory of Nelson. On the coast are several batteries, three piers, besides two at the harbour mouth, several public gardens, and a marine drive and promenade 2 miles long. Vessels of over 200 tons can enter the harbour, which is formed by the Yare. Y. is the principal seat of the English herring-fishery, which employs 400 boats and over 3000 hands; deep-sea fishing, the produce of which is forwarded daily to London, is also carried on, and employs many hands. The curing of fish, especially of herrings, is important, there being consumed for this purpose about 10,000 tons of salt annually; and the 'Yarmouth bloater' is highly esteemed in London and throughout the country. The quantity of fish sent from Y. by railway in the year 1864 was 34,432 tons. An

extensive export trade in agricultural produce, herrings, and malt is carried on. Coals, timber, wines, and salt are imported. Ship-building is carried on, and a manufacture of crape and silk goods. In 1865, 2489 vessels, of 263,299 tons, entered and cleared the port. The navigation of the coast is dangerous, but Yarmouth Roads, which extend between the coast and a line of sandbanks a short distance off shore, are a safe anchorage. Pop. (1861) 34,810.

YARN. The name applied to the thread spun for the purpose of weaving cloths of various kinds. It varies not only in the materials of which it is made, but also in the fineness to which it is spun. This latter quality is of great importance, as upon it depends entirely the evenness and quality of the manufacture. In order that uniformity may be insured, a pound of the material is taken as the standard, and this is divided into *hanks* or *cuts*. Thus, with linen yarn, a hank or cut consists of 300 yards; and if it takes 25 of these hanks to make a pound, the yarn is called 25s; and if 40, 40s; and so on. A hank of wool or cotton consists of 840 yards. No material admits of such fine spinning as cotton. Messrs Thomas Houldsworth & Co. of Manchester have probably produced the finest—that is the thinnest—cotton yarn ever seen; they have produced 700s, of which muslin has been made, and this is the finest ever woven; but to test the wonderful perfection of their machinery, they have produced yarn too fine to be exactly estimated, but believed to be No. 8000 or No. 10,000; or 10,000 hanks, each 840 yards, from one pound of cotton—or over 4000 miles in length.

YAROSLAV. See JAROSLAV.

YARROW. See ACHILLEA.

YARROW, a Scottish stream, rendered famous by song and ballad, rises a little over a mile east of Loch Skene, at the place where the counties of Dumfries, Peebles, and Selkirk meet. It flows in a general north-east direction through Selkirkshire, and joins the Ettrick about two miles above the town of Selkirk, after a course of 25 miles. About 3½ miles from its source, it expands into the Loch of the Lowes, which is a mile long, and a quarter of a mile broad. Leaving the Loch of the Lowes, the small stream enters St Mary's Loch, separated by a narrow neck of land, on which stands St Mary's Cottage (Tibby Shiels), from the other and smaller lake. St Mary's Loch is 3¼ miles long, and nowhere broader than 7 furlongs. The peaceful grassy hills which surround the loch slope downwards to the water's brink, uninterrupted by trees, and compose a scene of great quietude, over which broods the spirit of 'pastoral melancholy.' The prevailing calmness of the waters is pictured by Wordsworth in the lines:

'Let
The swan on still St Mary's Lake
Float double, swan and shadow.'

YASKA. See NIRUKTA.

YAW, in the motion of a ship or boat, is the term for describing an irregular deviation in the course steered. A very chopping wind or sea may produce this effect, but the helmsman would usually have the credit of bad steering.

YAWL, a decked boat having two masts, on the first of which is a lugsail and topsail; and on the aftermost, which rises almost from the sternmost, a driver or fore-and-aft sail. It is a very easily managed rig.

YAWNING may be either the simple result of deficient aëration, or may be brought on by the mere sight of the act in another person, and is a modification of the ordinary movements of respira-

tion, in which the inspiration is deeper than usual, and is accompanied by a kind of spasmodic contraction of the muscles which depress the lower jaw, and by a great elevation of the ribs and to some degree of the shoulder-blades. 'The purely involuntary character of the movement,' says Dr Carpenter, 'is sometimes seen in a remarkable manner in cases of palsy, in which the patient cannot raise his shoulder by an effort of the will, but does so in the act of yawning. Nevertheless, this act may be performed by the will, though not completely; and it is one that is particularly excited by an involuntary tendency to imitation, as every one must have experienced who has ever been in company with a set of yawners.'—*Principles of Human Physiology*, 8th ed., p. 280.

YAWS, known scientifically as *Framboesia*, is a cutaneous eruption of a very peculiar nature, which commonly attacks negroes, but has been noticed in Europeans. The disease is preceded by languor and pain in the limbs, and shivering, succeeded by heat and restlessness, and is more severe in children than in adults. After a few weeks, the pure glossy-black colour of the skin gives place to a dirty dull tint; and the patients often not only loath food, but take to eating coals, chalk, earth, &c. The skin is then covered for a few days with a white mealy scurf, as if it had been dusted with flour, after which pimples like pin-heads appear on the forehead, face, neck, groins, &c., which increase for a week or more, growing into crusted pustules, which enlarge until the base attains the size of a sixpence, or even a shilling. If the crust is removed, a foul sloughing sore is exposed. The pustules may, however, burst spontaneously, and discharge a thick viscid matter, which hardens to a scab on the surface. In the larger pustules, this surface at length becomes elevated into a red granulated excrescence, not unlike a wild raspberry (*Framboesia*), which is the true and characteristic yaw. In size, it may vary from that of a pea to that of a mulberry, and in colour it varies with the general health of the patient from a red to a pale white tint. It has very slight sensibility, and never properly suppurates, but discharges a glutinous fluid, which communicates the disease by inoculation. When the yaw has remained for some time, it diminishes in size, and as the pustule heals, is finally covered with skin, leaving little or no mark. When the disease seems to have reached its height, one pustule becomes much larger than any of the others, and instead of being elevated, is depressed. This is termed the master or mother yaw, and requires much care. When the mulberry-like excrescences appear on the soles of the feet, the resistance of the thick epidermis excites great pain. They are then termed by the negroes *Tubba*, or crab yaws. This disease is endemic among certain tribes of native Africans, and is common among the negroes of the West Indies and of North and South America. It is contagious, and cannot be communicated except by the actual contact of yaw-matter to the abraded skin, or by inoculation, which is sometimes effected by means of a large fly called the yaw-fly. The interval between the reception of the poison and the formation of the eruption varies from seven to ten weeks. The disease scarcely ever attacks the same individual more than once. 'Yaws,' says Dr Craigie, in his learned work on *The Practice of Physic*, 'are liable to be confounded with the secondary [tertiary?] or cutaneous symptoms of syphilis, with sivvens,* with the Arabian leprosy, with

* As Sivvens or Sibbens, and Radesyge, are diseases not much known to the general public, and not noticed in this work, we may mention that sibbens is a tuber-

radesyge, pellagra, and the red leprosy of Cayenne.' Several writers of eminence regard yaws as the same with the disease described in Leviticus, chap. xiii., as the Jewish leprosy, but the description of the symptoms there given is not sufficiently precise to furnish sufficient evidence regarding their identity. With regard to treatment, mercury does more harm than good, and all that can be done with advantage is to render the progress of the morbid processes as little painful as possible. The most important remedial agent is the warm bath; and blood-purifying drinks, such as decoction of sarsaparilla, &c., may be prescribed. The Africans have their own native remedies in the bark of trees called *Yuffo* and *Bullanta*, taken in infusion or decoction; and to destroy the mother yaw, they adopt the following barbarous process: Iron is boiled in lime-juice with a quantity of the common black ants and of Malaguetta pepper, and the liquid thus prepared is applied hot to the yaw.

YAZOO, a river of Mississippi, U. S., formed by the union of the Tallahatchie and Yallobusha, runs south and south-by-west in a very serpentine course, in a deep, narrow, sluggish channel, between fertile cotton plantations, and empties into the Mississippi River, 12 miles above Vicksburg; it is 290 miles long, and navigable at all seasons.

YEAR, a division of time containing a complete course of the seasons, and depending upon the revolution of the Earth (q. v.) round the sun. Its duration was variously determined by the nations of antiquity, the earliest method being the conventional one of making it include a certain number of lunar months; the lunar month being, after the day, the first period of time which was fixed. Twelve lunar months, giving a year of 354 days, were first taken as a near approach to a course of the seasons. This, though a pretty close approximation to the true value of a year, was yet so incorrect (being defective by more than 11 days) that it was soon found to be necessary to intercalate these 11 days, in order to preserve the year in a constant relative position to the seasons. The intercalation was variously effected: thus, the Egyptians, who knew the year of 365 days previous to 1500 B.C., divided it into three seasons ('Winter,' 'Summer,' and 'the Nile,' i. e., *the inundation of the Nile*) of four months each, made each month contain 30 days, and introduced five intercalary days at the end of the 12th month; the Greeks, who generally retained the lunar year of 354 days, added 3 months in the course of every eight years, giving an additional month to the third, fifth, and eighth year of each cycle; the Romans also added additional days, but their system of intercalation was continually changed, not always for the better, till Julius Cæsar caused the adoption of the solar year. The Romans likewise abolished, in Asia, Egypt, and all the other countries under their sway, the old method of reckoning by lunar years, and compelled the adoption of the Julian calendar, according to which the year was assumed to contain 365 days 6 hours. The substitution of the Gregorian Calendar in the 16th c. introduced for the average length of the solar year, 365 days 5

cular affection of the skin, often extending to the deeper tissues, very infectious, and said to be endemic in Dumfriesshire, Ayrshire, and Galloway, first described about a century ago by Dr Ebenezer Gilchrist; while the Radesyge, Spedalakhed, Spedalska, Liktraa, Northern Leprosy, or Marsh Sickness, is endemic in various parts of Scandinavia, consisting in its fully developed form of 'an eruption of pimples, scales, patches, and tubercular pustules on the skin, terminating in pusiform discharge, with or without ulceration.'—Craigie, *op. cit.*, vol. i. p. 690.

hours 49 minutes, which differs only by a few seconds from its true value; and this small annual error, as well as the excess of the true year over the year of 365 days, is compensated for by means of a succession of *Leap-years* (q. v.).

The time at which the year began varied much among different nations. The Carthaginians, Egyptians, Persians, Syrians, and other eastern peoples commenced their year at the autumnal equinox, at which time the civil year of the Jews also began, though their sacred year was reckoned from the vernal equinox. The commencement of the Greek year was at the winter solstice before Meton's time, and was then changed to the summer solstice. The Romans were the first to adopt the 1st day of January as the first of the year, but their example was not followed by subsequent European nations for some time. In France, the commencement was 1st March under the Merovingians, 25th March under the Carolingians, Easter under the Capetians, and 1st January from 1564. The ecclesiastical year in Europe generally commenced on 25th March (see DATE). The ancient northern nations reckoned their year from the winter solstice; the Russians, till Peter the Great's time, from 1st September, and the same reckoning, known as the Byzantine era, was in use in the Eastern Empire. Of necessity, the commencement of the year among Mohammedan nations has no fixed position in relation to the sun's course or the seasons, it being invariably a lunar year. In Astronomy, there are several kinds of years depending upon the various configurations of the earth in its orbit, and consequently varying in length. First, there is the *tropical*, or (as it is sometimes incorrectly called) *solar* year, which, from its being recognised in legislation and history, and commonly applied in the measure of time, has also received the name of *civil* year. This year is defined as the time which elapses from the sun's appearance on one of the tropics to its return to the same, and has a mean length of 365-2422414 mean solar days, or 365 days 5 hours 48 minutes 49-7 seconds (see PRECESSION). Next is the *sidereal* year, which is the period required by the sun to move from a given star to the same star again, and this year, affected as it is by Nutation (q. v.) only, is one of the most invariable quantities which nature presents us with, and has a mean value of 365-2563612 mean solar days, or 365 days 6 hours 9 minutes 9-6 seconds. The time which elapses between the earth's arrival at its Perihelion (q. v.) and its return to the same position, is known as the *anomalous* year, and is equivalent to 365-2595981 mean solar days, or 365 days 6 hours 13 minutes 49-3 seconds. The sidereal and anomalous years have a merely astronomical importance.

YEAST. In the process of fermentation of saccharine fluids containing albuminous matter, as in brewing or wine-making, the originally clear fluid becomes turbid, carbonic acid is evolved, and the substance causing the turbidity gradually separates in a grayish foaming mass of a bitter taste and an acid reaction. This is yeast; and on examining it under the microscope, it is found essentially to consist of aggregations of small oval cells of a vegetable nature, known as the yeast-cells, yeast-plant, or *Torula cerevisia* (q. v.). Yeast, as is well known, has the property of setting up fermentation in saccharine solutions; and beer-yeast, the kind with which we are specially acquainted, possesses, according to Professor Miller, this power in the highest degree, as may be shown by dissolving 4 parts of pure cane-sugar in 20 parts of water, and adding 1 part of fresh yeast; if this mixture be exposed to a temperature of about 80°, in less than

YEAST—YEDDO.

an hour, fermentation will have commenced. The investigations of Mitscherlich have led chemists to distinguish two varieties of yeast—viz., the *Ober-hefe*, or surface-yeast, and the *Unter-hefe*, or sediment-yeast, the former collecting on the surface of the fermenting fluid, and the latter forming a sediment. Surface-yeast is propagated by buds (see *TORULA CEREVISIÆ*) and sediment yeast by spores; and each variety produces specific results upon the fermenting fluid. The fermentation induced by the surface-yeast is rapid and irregular; while that produced by the sediment-yeast is slow and quiet. The surface-yeast is formed when the saccharine fluid ferments at a temperature of from 65° to 77°; while the sediment-yeast is chiefly produced when fermentation takes place at the lower temperature of from 32° to 45°. In their chemical relations, the two varieties present no apparent difference. On treating yeast with a solution of potash, a cellulose-like substance remains, while an albuminate is dissolved. The action of yeast is destroyed by exposing it to a temperature of 212°, by alcohol, by the strong mineral acids, chlorine, iodine, and bromine, oxide of manganese, creosote, &c.; on the other hand, it may be dried at a low temperature, or by pressure, and may be preserved in this state without losing its activity. The part which the globules of yeast play in exciting the conversion of sugar into alcohol and carbonic acid, is very obscure; but an experiment of Mitscherlich seems to shew that the sugar ferments only in those points which are in actual contact with the globules. Pasteur's experiments render it probable that the process of fermentation is connected with the assimilation of the sugar by the yeast-plant during the development of the yeast-globules, or, in other words, that 'the essential condition of fermentation is the conversion of albuminoid matter into organized globules.'

According to Mitscherlich's analysis, the cells of ordinary washed yeast in a condition to excite fermentation contain (the ashes being deducted): carbon, 47.0; hydrogen, 6.6; nitrogen, 10.0; sulphur, 0.6; oxygen, 35.8; while spent yeast (after fermentation had ceased) contained only 5 of nitrogen. The inorganic matter amounted to 7.3 per cent. of the dried yeast, and consisted entirely of phosphates.

The economic uses of yeast in bread-making, brewing, &c. are noticed in other articles. Beer-yeast (*Cerevisia fermentum*) is an article of the British Pharmacopœia. It is employed as a stimulant in the advanced stages of low fevers, and is especially serviceable in cases where, in consequence of inflammatory symptoms, wine is inadmissible. Neligan has found it of great service in intense typhus following parturition. The dose is two table-spoonfuls every three hours, and it may be given in camphor mixture or peppermint water. Yeast-poultice forms an excellent stimulating application to foul and irritable sores. It is composed as follows: Take of yeast, six fluid ounces; flour, fourteen ounces; water heated to 100°, six fluid ounces. Mix the yeast with the water, and stir in the flour. Place the mass near the fire till it rises. This poultice should be renewed every six or eight hours. Its special efficacy depends upon the carbonic acid gas which it evolves.

If surface-yeast or under-yeast be collected and placed on a cloth to drain, and then pressed until nearly dry, it can be kept with care for several months, and in that state is what is called GERMAN YEAST, for which a large trade has sprung up within the last few years; the imports to Britain from the continent alone having amounted, in the year ending 31st March 1866, to 115,068 cwts., or about 5753 tons. It is chiefly imported from Holland and Hamburg, and is obtained

mostly from the great continental distilleries. Nearly the whole of this large quantity is consumed by the bakers. PATENT YEAST is exactly similar, but is raised from a wort made purposely from malt and hops. ARTIFICIAL YEAST is a dough of wheat or other flour, mixed with a small quantity of common yeast, and made into small cakes, which are dried. If kept free from damp, it long retains its fermentive power.

YEDDO (meaning, as written by the Japanese, 'River Door'), the largest and most important city of Japan, the capital of the Tycoon or Shogun (*generalissimo*), the seat of the executive government and Gorogio, or council of state, and the *de facto* capital of the empire.* It is situated on the island of Nippon, on the bank of the river Okawa, where it debouches into the head of the Bay of Yeddo, in N. lat. 36° 40', E. long. 139° 40'. Its site is one of peculiar beauty. The broad valley in which it lies slopes gradually to the waters of the bay, and for leagues around are wooded hills, smiling valleys, and an ever-luxuriant vegetation—ever-green oaks, cryptogamia, conifera, in great variety; the yaks, the palm, and the bamboo. In the official quarter, the very heart of the city, parks with magnificent trees, temple-gardens, and broad green slopes, gladden the eye; while in the suburbs are hedgerows and shady lanes, clothed for the most part with an evergreen vegetation. Yokohama (q. v.), distant about 17 miles, is the foreign mercantile settlement of Yeddo.

The proximate area of the city has been estimated to be about 15 miles from north to south, and 8 miles from east to west—a total of about 120 sq. miles. Estimates of the pop. vary from 1,700,000 to 2,000,000 or 2,500,000 inhabitants. Entering the city from the suburb of Sinagawa, by the Tocado, or great imperial highway, the visitor meets a continuous stream of people on foot, and others in *morimons* or *cangos*, yakomins on horseback, and perhaps the *cortège* of a daimio, or territorial and feudatory prince, made up of horse and foot, bearing spear and halbert, crest and pennon—illustrating the phase of oriental feudalism which still prevails in Japan. Ward-gates, with decrepid municipal guards, are of frequent occurrence. Shops of all kinds, booksellers', armourers', sword-makers', basket-makers', coopers', pawnbrokers', fruit-shops, and many others, all open in front, succeed each other. After traversing a mile of tocado and a narrow street, an open space is reached—a sort of boulevard—where fairs are held, on one side of which is the Tycoon's cemetery, looking like a large and finely-wooded pleasure-ground. Crossing the bridge, the densely-populated *commercial quarter* is gained. The shops are scarcely equal to those in a Chinese street. Their signs are not a little grotesque—a fish, flying a flag aloft, denotes the stall of the fishmonger; a large pile of coins, the office of the money-changer. There is the street-vendor offering his moving stock of merchandise for sale. Carts of rude construction, piled with goods, and drawn by human cattle, are seen on their way to the dwellings of the buyers. Touting men or boys, outside the silk-mercers' shops, clamorously invite the custom of the passer-by. The shops, which are open to the street, and unprotected by glass,

* Strictly speaking, the city of Miako, being the residence of the Mikado, the one supreme though almost nominal sovereign of Japan (see JAPAN), is the capital of the empire; but Y., where the Tycoon and actual sovereign holds his court, is practically the metropolis of the country. As the Mikado is the phantom emperor, and the Tycoon the real sovereign, so Miako is the nominal, and Y. the actual capital of the kingdom.

usually make little show, for the better sort of goods cannot be exposed to the damp and dust. The bath-house, that notable institution of the country, is seen in full operation. Dogs and children abound everywhere. Large fireproof dépôts, protected by a thick coating of stucco, rise high above the ordinary shops, and patrols march constantly through each ward night and day, to give timely alarm of fire. There are many fire-bells, stations, and well organised fire-brigades. Nor are these precautions unnecessary in a city where water is scarce, and the houses are built for the most part of wood and lath, with a slight coating of mud. The Japanese reckon that the whole of Y. is burnt down by frequent fires, now in one part, now in another, once in seven years. Earthquakes are likewise of very frequent occurrence. In one of the most thickly peopled districts of the city, the *Nipon-bas*, the great central bridge of Japan, spans the river Okawa. It is a wooden structure, strongly fastened with massive iron clamps, and from it, distances are reckoned to every part of the empire in *ri*—a measure of 2½ miles British. The official quarter, with its triple lines of bastion, rampart, and moat, the *yamaskas*, or palaces of the daimios, and the Tycoon's castle,* is built on the summit of a range of hills in the centre of the valley, and covers an area of several miles in circumference. This heart of a great city has been compared to a succession of Hyde Parks or Kensington Gardens: green slopes, and overhanging groves, undulating lawns, deep moats, fed by tributary rivers, massive walls and gateways, and fine macadamised roads, are amongst its leading characteristics. The Tycoon's palace occupies the centre of the quarter, and the daimios' residences,† with gateways of elaborate architecture, stand around, and are built on one side of a triple line of great causeways or glaces, about 60 feet wide; on the other side are deep moats, the home of myriads of wild-fowl—the ibis of Egypt, storks, cranes, and paddy-birds—which are protected by the most stringent laws. Solidly constructed timber bridges (not drawbridges), flanked by high massive gateways, are thrown across each moat in three or four places. The walls and bastions are formed of polygonal-shaped blocks of granite, fitted into each other, but uncemented, to allow them to yield as much as possible, without displacement, to the oft-heaving ground. No ordnance is visible, and the whole fortification shews ignorance of the principles of military engineering, and appears to be useless as a defence against artillery.

The climate is better than any other east of the Cape. The sky is unclouded during the greater part of the year, and this bright weather lasts even through the early winter, and on to about the middle of February, when rain and snow, and easterly gales, may be expected. July and August, with a maximum temperature of 92° and a minimum of 63°, are the two hottest months of the twelve. During January and February, the two wettest months, the temperature ranges between 18° and 59°. During March, April, and a part of May, the weather is very pleasant, which is also generally true of the autumn months. There is an astro-

* When Sir Rutherford Alcock had an audience of the Tycoon, August 1860, the palace was rebuilding, having been destroyed by fire the year before, November 11, 1850.

† As a consequence of the moral and political revolution that has been going on in Japan since the opening of the country to foreigners, the daimios have withdrawn from Y., greatly to the injury of a considerable number of the inhabitants.—See *Blackwood's Magazine* for April 1867.

nomical school in Y., and an imperial navy-yard stands on the left bank of the river, on the east of the city.

It may here be noted, as supplementary to the article JAPAN, that, after much diplomatic pressure, the treaties made by the Western Powers with the Tycoon, and long ignored by the Mikado, have been ratified by the latter in a decree dated November 24, 1865. This is a measure of the utmost importance to the interests of the Western nations generally in Japan, as it completes the validity of their position, and leaves the daimios without any pretext for opposing the Tycoon in his foreign policy, and insulting the strangers he has admitted into the country.

Sir Rutherford Alcock's *Capital of the Tycoon* (Lond. 1863); Bishop Smith's *Ten Weeks in Japan* (Lond. 1861); Oliphant's *Narrative of the Earl of Elgin's Mission to China*, 1857, 1858, and 1859 (Lond. 1860); *Yeddo and Peking*, by Robert Fortune (Lond. 1863); *Parliamentary Papers*, 1865—1866.

YEDDO, BAY OF, an inlet of the North Pacific, on the south-east coast of the island of Nipon, Japan, lying between 35° and 35° 40' N. lat., and intersected by the 140th meridian of E. long. The city of Yeddo is situated at its north-western extremity. The depth of water, nowhere great, decreases all along the banks, towards the town, which, at low water, cannot be approached within a mile even by a boat. Solid batteries of granite, well kept, and in general aspect not unlike those of Cronstadt, have been erected midway between the anchorage and the shore.

YEKATERINBURG. See EKATERINBURG.

YELATOM. See JELATOM.

YELL, one of the Shetland Islands (q. v.), and, after Unst, the furthest north of that group, is separated from Mainland by Yell Sound, and from Unst by Blue Mull Sound. It is 17 miles in length, 5½ miles in average breadth. Area, 94 sq. m.; pop. (1861) 2716. The west coast is rocky and precipitous, but on the whole the surface is tame, and consists largely of moorlands—the greatest elevations being no more than 400 feet above sea-level. Agriculture is in an unusually backward state, and, though the surrounding seas are generally stormy, fishing is the chief employment.

YELLOW BERRIES. See FRENCH BERRIES.

YELLOW-BIRD (*Chrysomitris tristis*), a bird of the Finch family (*Fringillidae*), a native of North America, where it is very widely distributed. It is rather more than five inches in entire length; the male in summer plumage of a bright yellow colour, with black crown, wings, and tail, the upper and under tail-coverts white. The female is yellowish brown above, and ashy brown below, and the male assumes a very similar plumage in winter. Yellow-birds are often seen in large numbers, feeding on seeds of thistles and other plants, and seldom alighting on the ground. The nest is made of lichens fastened together with saliva, and lined with soft substances. The song of the Yellow-bird is very pleasing; and it is a sprightly and attractive cage-bird, easily tamed, and capable of being taught tricks. Several allied species are found in the western parts of America.

YELLOW COLOURS. The yellow pigments employed by painters are: 1. The varieties of chrome prepared from chromate of lead. See CHROMIUM. 2. Several colours technically called *pinks*—as *Brown Pink*, prepared as a lake from a decoction of French berries and fustic; and *English Pink* and *Dutch Pink*, both lakes, prepared by different processes from French or yellow

berries and turmeric. 3. *Naples Yellow*, a mixture of metallic antimony, red-lead, and oxide of zinc calcined, added to a small quantity of lime, then fused, and afterwards ground to powder. 4. *King's Yellow* is a tersulphuret of arsenic. 5. *Patent Yellow* consists of 28 parts of chloride of lead and 27 parts of carbonate of lead well mixed in powder, and then fused together. 6. *Weld Yellow* is prepared from a decoction of Weld (*Reseda luteola*), or dyer's weed, with alum, and is, in fact, another yellow lake. It is much used in paper-staining. 7. *Gamboge*, which constitutes the chief yellow colour used in water-colour painting.

YELLOW FEVER is a disease endemic in low districts near the sea, but under certain circumstances sporadic in other places, never appearing beyond 48° of north latitude, nor without a temperature of at least 72° F., nor above the elevation of 2500 feet above the level of the sea, depending in part on causes not yet known, but in circumstances favourable to its production, capable of being propagated by contagion. It usually commences suddenly (generally in the night or early morning) with a sense of coldness, a rigor, or actual shivering, followed by vascular reaction, as shewn by the heat and dryness of the skin, headache, especially over the eyes, and pain of the eyeballs, which are suffused, and have a strange drunk-like aspect. The limbs and loins are painful; the tongue is loaded, and its edges are red. There is a peculiar and characteristic flush or suffusion of the face, occupying a zone of about an inch above and below the eyes. Nausea, gastric uneasiness, and a tendency to vomit soon supervene. These symptoms may gradually lessen, and the patient will then regain his ordinary health in 24 or 36 hours; but if the symptoms persist, they soon become more aggravated, and the stomach ejects at first a clear fluid, which soon becomes of a dirty-brown tint, and is finally succeeded by the true *black vomit*. A yellow tint on the conjunctiva is observed, which extends to the skin of the face; and as the disease advances, the whole body becomes of a yellow colour, varying in intensity from a pale lemon to a deep orange tint. The anxious countenance indicates the distress of the patient, who appears to be agitated by fearful apprehensions or incipient delirium. The skin feels constricted, and is of a pungent heat. The bowels are constipated, and the red, clean, and tremulous state of the tongue indicates the presence of intestinal irritation, and consequently the increase of danger. The urine and other excretions are more or less suppressed. Eructations, hiccoughing, and vomiting increase the distress and weakness. The disease in fatal cases usually terminates on the second or third day. The above train of symptoms is by no means constant. Sometimes, when everything seems favourable, black vomit suddenly appears, and the patient immediately succumbs. In other cases, patients experience no symptoms except severe pains in the legs and suppression of urine, and die without taking to their beds. In all cases terminating fatally, albumen appears in the urine on the second or third day. In females, the catamenial discharge is sure to appear, whether due or not. The discharges from the bowels, towards the close of the disease, may be black or dark green, and these dark evacuations are succeeded by what is termed the 'caddy-stool,' resembling dark sandy mud. As yellow fever is not a disease of this country, we shall not enter more fully into its symptoms. According to Dr Jackson, who has written an excellent treatise on this disease, the usual course of yellow fever in its most concentrated form consists of 12 hours of forming period, 36 or 48 of formed or proper fever, and 24 or 36 of declining or concluding

period. When the symptoms are less intense, the patient may survive to the 14th day. In the milder modifications of this disease, the morbid symptoms are prolonged to a considerable extent. Death may occur at any period of the disease, and the mode in which it occurs is by syncope (fainting), uræmia (or poisoning of the blood by the accumulation of urea), apoplexy, or asphyxia or suffocation. When the black vomit is plentiful, and the urine free, the intelligence remains unaffected, but the skin becomes cold and damp, the pulse small, and finally imperceptible at the wrist, and death ensues from gradual exhaustion and syncope. When the black vomit is scanty, and the urine is suppressed, the poisoned blood acts upon the brain, and the patient exhibits wild delirium, followed by coma, convulsions, and death. The ratio of deaths to cases in the disease is always very high. From Tulloch's statistical Reports on the Diseases of Soldiers, it appears that in the Windward and Leeward command, the ratio was 1 to 2½ (or 3 in every 7 cases died), in the Jamaica command it was 1 to 1½ (or 3 in every 4 cases died), while in Gibraltar it was 1 to 1½ (or 3 in every 5 cases died).

There are great differences of opinion as to the proper treatment of this disease. Dr Blair, one of the highest authorities on yellow fever, holds that the disease may be cut short or aborted by prescribing '20 grains of calomel added to 24 grains of quinine, afterwards followed by two drachms of carbonate of magnesia, and two ounces of sulphate of magnesia in eight ounces of peppermint water.' These aborting doses were repeated at intervals of four or six hours, one dose being generally efficient, but four have been given before the quinine induced its special symptoms of cinchonism. Many physicians who have had much experience of this disease, have no belief in the abortive treatment; and some treat their cases with antiphlogistic or lowering remedies, and others with stimulants. It is probable that there is no one mode of treatment suitable for all cases, and that each should be treated according to its special symptoms. The extreme heat of the surface (a temperature of 107° has been observed in the arm-pit) may be relieved by the frequent application of the wet sheet; cupping or leeches often relieve the head-symptoms; and a blister to the gastric region may relieve the irritation of the stomach. If there is no suppression of urine, and if that fluid is free from albumen, morphia is of great service, but it must be given with great caution. The food should be of the mildest form, such as chicken-tea, arrowroot, sago, and barley-water, and these should be taken frequently in very small doses, in consequence of the state of the stomach. Similarly, with regard to all drinks, which are most likely to be retained if sucked through a tube or given by tea-spoonfuls. Tea usually disagrees, but cold infusion of oatmeal, and very dilute brandy and water, are usually relished. Our highest authority on Tropical Diseases, Sir J. Ranald Martin, states that, whenever the disease breaks out, 'the most speedy means of prevention [of its spreading] in respect to towns and garrisons, will always be found in the removal of both the sick and the healthy to a locality where the temperature is sufficiently low, such as a neighbouring range, or dry ventilated ground.' In all ships on service on the west coast of Africa and other unhealthy stations, the following rules (which we borrow from Dr Aitken's *Handbook of the Science and Practice of Medicine*) should be strictly attended to. A prophylactic dose of quinine (five grains) should be administered to the men daily (a precaution that should be taken in all malarious regions, independently of yellow fever). Whenever the fever appears on board, the ship should at

once put out to sea, and should proceed to the coolest atmosphere within reach. The most immediate measures of prevention should be, to obviate direct solar exposure, to prevent fatigue, and to check any excesses in the use of spirits. Seamen should be kept as remote from unhealthy coasts as is consistent with duty, anchoring every evening a few miles from the shore, if possible. Duties in boats should as much as possible be conducted during the mornings and evenings, the noon-day heats and the deadly nocturnal emanations being to be equally avoided. When men are landed, they should be encamped on high and dry ground. Meals should be regularly served and carefully cooked, and coffee should be given early in the morning, and after unusual fatigue or exposure, and no work should be commenced till the coffee has been taken. Holds of ships should not be cleansed on the spots where the fever has originated, or during its prevalence, but the process should be deferred till the vessel is in a colder latitude. Lastly, green wood should not be placed on board ship in hot climates, but the wood should be barked and partly charred.

Dr Craigie, in his learned *Practice of Physic*, gives the following extensive list of synonyms of Yellow Fever: '*Febris flama, Typhus ecterodes, Sauvages and Cullen; La Maladie de Siam, La Fievre Maitlotte, Vomito Prieto, Chapetonada, Fievre Amarilla Hispanorum et Hispano-Americanorum*;' New Distemper of 1691; Kendal's Fever, Pestilential Fever, Bilious Fever of Gamble; Endemic Causus or Burning Fever of Moseley; Malignant Pestilential Fever of Chiahholm; Remittent and Bilious Remittent of Hunter; Concentrated Endemic Fever of Jackson; Tropical Continued Fever of Lempriere.' We shall conclude with a short notice of the history of this disorder. Long before the arrival of Cortes in Mexico, an extremely fatal epidemic disease used to prevail amongst the native Mexicans. Epidemics of special severity occurred in 1545, 1576, 1736—1737, and 1761—1762. Although Humboldt thinks that the elevation of the table-land of Mexico (7200 to 7800 feet above the level of the sea) is sufficient to exclude any idea of the identity of this disease, known as *Mallazahualt*, with yellow fever, there can be little doubt, from the similarity of the symptoms, that the two diseases are really the same. The Europeans visiting the shores of America soon became painfully familiar with the disease; and it is almost certain that 'the plague' which so often destroyed the English and Spanish troops at the end of the 15th and the beginning of the 16th centuries was in reality yellow fever. A disease bearing the character of yellow fever appeared in 1618 among the Indians in certain parts of Massachusetts, and prevailed with much severity till 1622, and it committed great havoc among the emigrants to Virginia. When the expedition against Hispaniola in 1655, under Venables, returned to Jamaica, they met there 'an enemy (the plague) more severe than the Spaniards, which in a little time reduced the army, originally 7000, to fewer than 2000 men.' There can be little doubt that this plague was yellow fever. In 1691, it was very fatal in Barbadoes, where it was known as the *New Distemper*. From about this date, yellow fever has been endemic in the West Indies. It was unknown at Carthage and along the coast till 1729, when it committed dreadful havoc; the Spanish galleons never remaining any time without interring one-half, or at least one-third of their men. In 1740, it first appeared at Guayaquil, since which time it has often occurred; and in all the towns on the coast of the American continent and islands between 45° N. lat. and 10° S. lat., it appeared in proportion as Europeans began to visit them. 'In this manner,' says Dr Craigie,

'Vera Cruz, Cumaná, Havana, Acapulco, and La Guayra have successively become its endemial abodes; and its appearance in these towns is as uniform and certain as the arrival of the sun at the tropic of Cancer. Of these places, Vera Cruz and Havana may be regarded as the nursery of yellow fever; and from the month of March to that of September or October, the disease rages like a pestilence among the recently arrived Europeans, and those natives who descend from the elevated table-lands of the interior.' Until the year 1793, the disease was regarded as having a spontaneous origin, and being due to tropical peculiarities operating on European and unseasoned constitutions; but that year the doctrine of infection suddenly started. In that year the disease appeared with great virulence in the island of Granada, and rapidly spread over the Antilles to Philadelphia, and many parts of the state of Pennsylvania, to Massachusetts, New York, Caroline county Maryland, Alexandria in Virginia, several counties in North Carolina, and Caraccas in Venezuela. This outbreak was preceded by a few days by the arrival of a vessel from Bulam, on the West African coast, at a harbour in St Granada, in which vessel, when stationed off Bulam, fever had prevailed about five months before to a great and fatal extent. This disease was at the time termed the Bulam Fever, but soon turned out to be ordinary yellow fever. Since 1763, yellow fever has very often appeared as an epidemic in the West India Islands and various parts of the American states, and has even been endemic in various parts of the south of Europe, especially Gibraltar and Malaga. From the testimony of many medical writers, it is certain that a disease essentially identical with yellow fever prevails endemically along the west coast of Africa, at Senegal, Sierra Leone, Cape Coast Castle, and the island of Fernando Po. Fortunately for this country, this fell disease, which has repeatedly been brought to our shores (Swansea, Southampton, &c.), is at once nipped out by our climatic conditions. When, last year, it was imported into Swansea, Dr Buchanan, who was at once sent down by the government to watch the disease, and take the necessary measures to prevent it from spreading, recorded 12 instances in which, with filth, bad ventilation, and every other condition favouring the fever, it failed in every case to spread beyond the original victim. Altogether there were 20 cases, of which 15 were fatal. The disease then disappeared.

A disease closely resembling, but apparently not quite identical with yellow fever, is now (1867) committing great ravages in Mauritius.

YELLOW-HAMMER, or YELLOW-BUNTING (*Emberiza citrinella*), a species of Bunting (q. v.), which is one of the most common of small birds in Britain, distributed over all parts of the country, and is common also in most parts of the continent of Europe, from Norway and Sweden to the Mediterranean. It is about seven inches in entire length, and the male is a bird of brilliant plumage, although there is something in the short thick form of the bird, and in the tints and distribution of its plumage, which prevents it from being greatly admired for beauty. It is, perhaps, also the less regarded because it is so common; and in many parts of Britain there is a prejudice against it, so that boys who would think it wrong to rob any other bird's nest, esteem it a kind of duty to rob that of the yellow-hammer. In the summer plumage of the male, the head, cheeks, ear-coverts, and nape of the neck are bright lemon yellow, with a few dusky black patches; the upper part of the back and wings are reddish brown, tinged with yellow; the wing primaries are dusky black, with

narrow external edges of bright yellow; the secondaries, tertials, and wing-coverts dusky black, broadly margined with rich chestnut brown; the upper tail-coverts reddish chestnut, edged with yellow; the tail-feathers dusky black, the central pair edged with chestnut, and tinged with yellow; the chin, throat, and whole under surface, bright lemon yellow, clouded on the breast and flanks with reddish brown. The tail is slightly forked, and is shorter than that of the Common Bunting. The knob in the palate is also less conspicuous. The female has much less yellow about the head than the male, and her plumage is altogether much less vivid. The Y. frequents hedges and low trees, and is often to be seen, especially in winter, in the vicinity of houses, in flocks, with sparrows, chaffinches, &c. It generally makes its nest on the

Yellow-hammer (*Emberiza citrinella*), with Nest and Eggs.

ground, under shelter of a bush or a tuft of grass, forming it of moss, roots, and hair. The song of the male is very sweet, and consists of few notes, which have been jocularly set to music with the words, 'A little bit of bread, but no-o cheese.' He is remarkably attentive to his mate, and takes his turn in incubation. In Italy, great numbers of yellow-hammers are caught, and fattened like ortolans for the table. It is a curious and noteworthy circumstance, that this bird is rare in insular situations; in the islands of the Mediterranean, as well as the Orkneys. The name Yellow-hammer is a corruption of Yellow-ammer; *Ammer*, in German, signifying Bunting. In Scotland, the Y. is known as the Yoldrin or Yite.

YELLOWLEGS (*Gambetta flavipes*), a bird of the order *Grallatores*, and family *Scolopacidae*. It is fully ten inches in entire length; the bill, which is straight and slender, being an inch and three-quarters. The wings are long and pointed, the tail short, the legs long, and the lower half of the tibiae naked. The upper parts are ash-colour, with many large arrow-headed and other spots of brownish black, edged with white; the lower parts are white, with brownish lines and arrowhead markings. The legs are yellow, and are very conspicuous when the bird takes flight. This bird is generally distributed over the eastern coasts of North America, from Maine to Florida, migrating southwards in winter. Small flocks are seen wading in search of food, which consists of the fry of fishes, crustaceans, worms, &c., sometimes on the margins of lakes, as well as on the sea-shore. In winter, the Y. migrates to the warmer parts of America. In autumn, it is very fat, and is prized for the table.

YELLOW RIVER. See HWANG-HO.

YELLOW SEA. See WHANG-HAL.

YELLOWSTONE, a river of the U. S., rises in

Sublette's Lake, near Fremont's Peak of the Rocky Mountains, and receiving numerous branches from the south, flows north-easterly through the territory of Montana, and empties into the Missouri River, in the north-west part of Dakota Territory, lat. 48° 5' N., long. 104° W. It is 800 yards wide at its mouth, 1000 miles long, and navigable 700 or 800 miles.

YELLOWTHROAT (*Trichas Marylandica*), a bird of the Warbler family (*Sylviadae*), very common in North America, from the Atlantic to the Pacific, most abundant in the middle states, particularly in Maryland. It prefers the neighbourhood of swamps. It is about 5½ inches long; its colour olive green above; bright yellow on the throat, breast, and under tail-coverts; the males have a broad black band on the forehead in summer, which disappears in winter. Its song is pleasing, but not very musical. It makes its nest on the ground. It is one of the birds best known to everybody in North America.

YELLOW-WOOD (*Oxleya xanthocyla*) a valuable timber-tree of eastern parts of Australia, of the natural order *Cedrelaceae*. It is a great tree, often 100 feet in height. The wood is very yellow. It is used for carpentry and boat-building.

YEMEN, in a wide sense, includes the whole south and south-west of Arabia; but, more strictly, is the name only of the south-western corner of the peninsula, bounded on the N. by Hedjaz and Nedjed; on the E., by Hadramaut and the Dahna, or Great Arabian Desert; on the S., by the Gulf of Aden; and on the W. by the Red Sea. It was known to the ancients as *Arabia Felix* (*Felix* being a mistranslation on the part of Ptolemy of *Yemen*, which does not mean 'happy,' but the land to the 'right' of Mecca), and they obtained from it much frankincense, myrrh, and other costly balsamic substances, in which it abounds more than any other part of the world; they obtained also from its ports the products of India, and other eastern regions, with which its inhabitants maintained a constant trade. The history of Y. reaches back to the highest antiquity. The Joktanides, descendants of Joktan or Kahtan, are its first possessors of whom we have any record; and from them it seems to have passed, about 2400 B. C., into the hands of the Himyarites, or Homerites. The Himyarite states and cities of Saba, Thaphar, and Athana or Aden, attained at an early period a high degree of prosperity, carrying on a great commerce both by sea and land, and they extended their dominion over a large part of Asia and the north-west of Africa. See **SABEANS** and **ADEN**. The persecution of the Christians by the last Himyarite princes led to the overthrow of the Himyarite power by the Abyssinians, 529 A. D. From this date till 601, Y. was ruled by Abyssinian governors; then for a short time by the Persians, under Khosru (*Chosroes*) II. The followers of Mohammed did not succeed in subduing Y. till they had for a considerable time been masters of the rest of Arabia. Under all the califs, and even under Saladin, Himyarite princes retained a partial independence, which they reacquired when the Turks, who conquered the country in the 16th c., were expelled in the century following. To this day the country is under the dominion of a number of Himyarite princes or sheiks, the most powerful of them being for a time the Imám of Saná (q. v.). The political condition of the country is, and long has been, very unsettled.

The people of Y. differ considerably in physical characteristics, dress, and manners from the inhabitants of the other parts of Arabia, and their

language gives evidence of a different origin. See **SARJANA**.

Our geographical knowledge of Y. has been much increased by recent explorations, and charts of its coasts have been laid down by officers in the service of the East India Company. Throughout the whole length of the country, at a distance of from 10 to 30 miles from the coast, a chain of mountains extends, between which and the sea is a tract of low ground, the *Tehama*, generally sandy and desolate, but in some places very fertile, and clothed with tropical vegetation. Inland from the mountain chain is a fertile table-land, at a general elevation of about 4000 feet, yielding the productions of warm temperate rather than of tropical regions. Some of the mountains rise to a height of about 8000 feet. The slopes even of the more lofty mountains are covered with luxuriant forests, and the mountain valleys are of unsurpassed fertility. The principal exports are coffee, dates, senna, gums and gum-resins, wax, ivory, and goat-skin morocco. Some grain is also exported. There are no rivers; but good harbours are formed in some places by natural openings in the coral reefs which line the coast. The principal ports are Mocha (q. v.), famous for the coffee which it exports; Aboo Ariah, or Gasim; Hodeida; Shehr; and Aden (q. v.), which is now in the hands of the British. Sanaa, the capital, or nominal capital, is situated on the table-land. Damar, Taas, Loheia, Beit-el-Fakih, and Zebeed are among the other principal towns.

YENIKALÉ STRAIT, sometimes also called **STRAIT OF KERTECH**, connects the Sea of Azov with the Black Sea, forming a sea-passage between the Crimea on the west and the Caucasus on the east. It is over 20 miles in length, and at its narrowest is less than 2 miles, and so shallow and interrupted by shoals, that cautious sailing and steering are necessary even for small steamers.

YENISEI, one of the largest rivers of Siberia, formed by the junction of the Oulou-Keme and the Bey-Keme, which rise in the mountains on the southern border of Siberia. It flows north through the centre of Siberia into the Arctic Ocean, forming at its mouth a long estuary. In the earlier part of its course, it is interrupted by falls and rapids; but afterwards flows through a great plain or steppe, receiving many tributaries, of which the principal are the Upper Tunguska or Angara, from Lake Baikal; the Lower Tunguska, from the Baikal Mountains; and the Turoukchau. Its length is 2700 miles, and it drains a basin of upwards of 1,000,000 sq. miles. A great part of the Y. is navigable, and is now regularly traversed by steamers.

YENISEI'SK, a town in the government of the same name in Siberia, 850 miles east of Tobolsk, lat. 58° 27' N., long. 92° 16' E., on the Yenisei. Pop. 6824. Y. was founded in 1618, and is one of the most important towns of Siberia, the chief article of trade being furs, which are bartered by the native nomad tribes. It is three miles in circumference, and has a custom-house and arsenal.

YEO'MAN (Ang.-Sax. *gemen*, common), a term which seems, in early English history, to have been applied to a common menial servant, but after the 15th c. came to denote a class of small freeholders, forming the next grade below gentlemen. The term yeoman is sometimes considered identical with the forty shillings freeholder, possessed of the elective franchise.

YEO'MANRY, a volunteer force of cavalry in Great Britain, numbering about 14,000 men, and costing the country annually about £85,000. It was originally formed during the wars of the French Revolution, and then comprised infantry as well as

cavalry; but the whole of the infantry corps, and many of the cavalry, were disbanded after the peace of 1814. The organisation of the corps is by counties, under the lords-lieutenant. The men provide their own horses and uniform; in consideration of which they receive annually a clothing and contingent allowance of £2 a man, are exempt from taxation in respect to the horses employed on yeomanry duty, and draw during the annual training 2s. a day for forage, besides a subsistence allowance of 7s. a day. If called out for permanent duty, they receive cavalry pay, with forage allowance. The yeomanry are available in aid of the civil power; and in time of invasion, or apprehended invasion, the sovereign may embody them for service in any part of Great Britain, under the provisions of the Mutiny Act and Articles of War.

YEOMEN OF THE GUARD, a veteran company, consisting of 100 old soldiers of stately presence, employed on grand occasions, in conjunction with the gentlemen-at-arms, as the body-guard of the sovereign. These Yeomen were constituted a corps, in 1485, by King Henry VII., and they still wear the costume of that period. Armed with partisans, and in the quaint uniform, the men present a curious sight in the 19th century. The officers of the corps are a captain (ordinarily a peer), a lieutenant, and an ensign. There is also a 'Clerk of the Cheque and Adjutant.' All these appointments are held by old officers, and are considered as important prizes. The whole charge is borne by the sovereign's civil list. The headquarters of the corps is at the Tower of London, where the men are popularly known as *Beef-eaters* (q. v.).

YEO'VIL, a small municipal borough of Somersetshire, 20 miles south of Wells, on the borders of Dorsetshire, a busy, handsome place, built of red brick and yellow Hamhill (a neighbouring quarry) stone, and situated in a pleasing district on a hill-side sloping to the Yeo. The church of St John, a structure of the 15th c., is much admired. The height of the side aisles, and large size of the windows, give it grace and lightness, and hence it has been called the 'Lantern of the West.' There are several other churches, besides schools, almshouses, and other charities. Kid and other gloves are here more extensively manufactured than in any other town in England. There are about 20 manufactories, in which are produced about 10,000 dozen pairs of gloves per week. The number of males alone employed in this manufacture is about 2000; the females, who sew the gloves, all work at home, and are mostly the wives and daughters of agricultural labourers, inhabitants of the surrounding country, and amounting probably to about 10,000. Woollen manufactures and leather-dressing are also carried on. It has received its charter of incorporation since 1851. Pop. (1861) 7957.

YERCOUM, another East Indian name of the plants called Mudar (q. v.), and of the fibre which they yield.

YESSO, or **JESSO**, the most northerly of the four principal islands which compose the empire of Japan (see **JAPAN**), lies north of the central island of Nipon, from which it is separated by the Sangar or Tsugar Strait. It is about 350 miles in length from east to west, and is 250 miles in extreme breadth. Area estimated at 62,500 sq. m.; pop. unknown. The surface is mountainous, and the island is rich in minerals. The chief town, Matamai, on the south coast, is said to contain 50,000 inhabitants. After Matamai, the most important seaport is Hakodadi (q. v.).

YETHOLM, a parish of Scotland, in the

north-east of Roxburghshire, bordering on England, on the east and north-east, 15 miles east-north-east of Jedburgh. The Beaumont Water runs through the parish, and on either side of this stream are the villages of Kirk-Yetholm and Town-Yetholm, the former being the head-quarters of the gipsies in Scotland. According to the census of Scotland for 1861, the village of Yetholm contained 544 inhabitants.

YEW (*Taxus*), a genus of trees of the natural order *Taxaceæ*, which is very generally regarded as a sub-order of *Coniferae*, and is characterised by solitary and terminal fertile flowers, with a solitary ovule sessile in the centre of a fleshy disc, forming a sort of drupe when in fruit, and by dicotyledonous seeds. The genus *Taxus* is distinguished by a solitary terminal seed, surrounded by a succulent cup. The species are diffused over the whole northern parts of the world, and are large and beautiful evergreen trees, with narrow lanceolate or linear leaves. The COMMON YEW (*T. baccata*), a tree

Yew (*Taxus baccata*).

of 30—40 feet, and a trunk sometimes of great thickness, branching a few feet above the ground, and forming a large and dense head, is a native of the middle and south of Europe and of Siberia. Noble specimens of it are to be seen in many parts of Britain. It attains a great age, at least 300 or 400 years. Its wood has been much used from very early times for making bows, for which it is preferred to every other kind of wood. It is very hard, and reckoned almost equal to boxwood for fine work. The heart-wood is of an orange-red or deep-brown colour. The fruit is red, and was long reputed poisonous, but the pulpy part is not so; the seed, however, is a dangerous poison. The leaves also are a powerful narcotic; and although they are sometimes given as a vermifuge, their use is attended with danger.—The IRISH YEW (*T. fastigiata* of Lindley; *T. Hibernica* of Hooker), originally discovered in Ireland, and now very common in pleasure-grounds, is by many supposed to be a mere variety of the common species, with upright fastigate habit, but it differs also in having the leaves scattered, whilst those of the Common Yew are in two rows.—The NORTH AMERICAN YEW (*T. Canadensis*) is of humbler growth.—The name JAPAN YEW is sometimes given to *Podocarpus macrophyllus*, a tree of a genus nearly allied to *Taxus*, and recently separated from it. It is a large and stout tree, a native of Japan; its wood much valued for cabinet-work. Other species of *Podocarpus* are natives of

the warmer parts of Asia, of Chili, New Holland, &c. *P. nucifer* is a lofty tree of the northern provinces of Japan and mountains of Nepal, from the seed of which an oil is extracted, fit for culinary purposes, although the seed itself is too astringent to be eaten. To the order or sub-order *Taxaceæ* belongs also the genus *Salisburia* (see GINGKO), the genus *Dacrydium* (q. v.), and *Phyllocladus*, a genus in which the foliage, as in *Salisburia*, has a remarkable resemblance to the fronds of ferns. *P. trichomanoides* is a large New Zealand tree.

YEZD, a considerable city of Western Persia, capital of the province of the same name, situated on the south-west angle of the great desert of Khorasan, in lat. 32° 7' N., long. 54° 50' E. It is surrounded by a wall and ditch, is said to be five miles in circuit, and consists of an old town and a large modern suburb. It is the great emporium of the internal commerce of the empire, as it is a convenient resting-place for caravans from Kerman, Herat, and Meshed, on the east and south-east, and which are met here by merchants from Ispahan, Shiraz, Tehran, and other places on the west and north-west. Manufactures of silk stuffs, velvets, cotton and woollen fabrics, arms, and loaf-sugar are carried on, and the bazaars are spacious and well supplied. Pop. estimated at 50,000, many of whom are Guebres (q. v.).

Y'GGDRASIL, the name given in Scandinavian Mythology to a tree, the greatest and most sacred of all trees, which was conceived as binding together heaven, earth, and hell. It is an ash, whose branches spread over all the world, and reach above the heavens. It sends out three roots in three different directions: one to the Asa-gods in heaven, another to the Frost-giants, the third to the under-world. Under each root springs a wonderful fountain, endowed with marvellous virtues. From the tree itself drops a honey-dew. Among its branches and roots, several animals sit or run about: an eagle, a squirrel, four stags, a serpent, all having their own proper names. The serpent, Nithhöggr, lies at the under-world fountain and gnaws the root of Y.; the squirrel, Ratatöskr, runs up and down, and tries to breed strife between the serpent and the eagle, which sits aloft.

Of this old-world myth too imperfect an account has survived to enable us to read its meaning. Some writers in the middle ages bring it into connection with the Cross. It is striking to find Virgil (*Georg.* ii. 291) describing the ash as sending its branches as high into the air as it sends its roots into the earth—

*Esculis in primis, quæ quantum vortice ad auras
Ætherias, tantum radice in tartara tendit.*

Remarkable coincidences, although of a fragmentary kind, are also found in eastern traditions.

Jacob Grimm sees an intimate connection between the world-tree Y. and the *Irmenseule*, of which numerous traces are to be found in the records of German antiquity. This is described by Rudolf of Fuld as a great trunk of a tree set upright, and worshipped in the open air; the name *Irminsel*, he explains as meaning the universal or all-sustaining pillar (Ger. *Säule*, pillar). Such a tree-idol was destroyed by Charles the Great in his conquest of the Saxons in 772, at a place called Heresburg, in Westphalia, which was a chief seat of the pagan religion of the Saxons. The word *irmin*, Ang.-Sax. *eormen*, was frequently compounded with other words in the earlier stages of the Teutonic languages, in the sense of universal, greatest of all. As the primitive nature-worship tended more and more to the personification of particular powers, these trunk-idols were associated with particular divinities, and perhaps

had an image set upon them, or were cut into some rude resemblance, as in the case of the Greek pillar-images called *hermæ* (see HERMES). The coincidence of the names *irmin* and *hermæ*, which may, however, be casual, has not failed to be remarked. The Christmas tree of modern Germany may be some kind of offshoot of the old notion of Yggdrasil.

Y-MOTH (*Plusia gamma*), a beautiful species of Moth (q. v.), common in Britain and throughout great part of Europe, about an inch in entire length, without reckoning the antennæ, which are not quite half an inch. The colour is lilac, variegated with brown, the upper wings beautifully marbled, with a shining mark nearly in the form of the letter Y, or of the Greek γ (Gamma), whence the name. The lower wings are dirty white, with a broad smoky border, and a white fringe, spotted with black. This moth flies about during the day in summer and autumn. It is very swift of flight. It lays its eggs on the under side of leaves. The caterpillar is slightly hairy, green with a yellow line along each side, and five white ones down the back. It feeds on the leaves of a great variety of plants, as peas, beans, turnips, cabbages, hemp, clover, oats, and other grasses. It sometimes ravages gardens, but more in France than in Britain.

YOGA (from the Sanscrit *yuj*, join; kindred to the Lat. *jung*, Gr. *zeug*, Gothic, *juik*; hence *junction*, and figuratively, 'concentration, religious or abstract contemplation') is the name of one of the two divisions of the Sāṅkhya philosophy of the Hindus. See SĀṅKHYA. While the first of these divisions, the Sāṅkhya proper, is chiefly concerned in teaching the *tattvas*, or principles of creation, and the successive development of the latter, the main object of the Yoga is to establish the doctrine of a Supreme Being, and to teach the means by which the human soul may become permanently united with it; and since the Sāṅkhya proper is silent on the creation of the world by a Supreme Being—whence it was charged, though unjustly, by its opponents, with being atheistical—the Yoga, which is called theistical, is considered to be its complement. According to Patanjali, the reputed author of this system, the term *Yoga* means 'the hindering of the modifications of thinking;' and by such modifications, which, he says, may be accompanied with afflictions, or be free from them, he understands 'the three kinds of evidence—viz., perception, inference, and testimony—misconception or incorrect ascertainment, fancy, sleep, and recollection.' The 'hindering of these modifications' is, according to him, effected either by a repeated effort to keep the mind in its unmodified state, or by *dispassion*, which is the consciousness of having overcome all desires for objects that are seen (on earth) or are heard of (in Scripture). 'Dispassion is conducive to meditation; this, again, is of different kinds, and is attained either 'impetuously'—in adopting various transcendent methods—or 'by a devoted reliance on *Īśvara*, the Lord.' This Lord, or Supreme Being, Patanjali then defines as 'a particular *Puruṣa*, or spirit, who is untouched by afflictions, works, the result of works, or deserts; in whom the germ of omniscience reaches its extreme limit; who is the preceptor of even the first, because he is not limited by time; and whose appellation is *Om*, the term of glory.' This word is to be muttered, and its sense is to be reflected upon, for 'from it comes the knowledge of *Īśvara* and the prevention of 'the obstacles' which impede Yoga. These obstacles, Patanjali says, are 'illness, apathy, doubt, listlessness about the accomplishment of meditation, want of exertion, attachment to worldly objects,

erroneous perception, failure to attain any stage of meditation, or inability to continue in the state of meditation when it has been reached.' There are several other methods to prevent these obstacles from distracting the mind, and impeding its steadiness. One, for instance, consists in pondering over one single accepted truth; another in 'practising benevolence, tenderness, complacency, and disregard towards all objects in possession of happiness or grief, virtue or vice;' another, 'in forcibly expelling or retaining the breath;' another, in 'dwelling on knowledge that presents itself in dream or sleep;' &c. When all these modifications have disappeared, the mind becomes free from 'the tingeing' of the exterior world, as the pure crystal is free from the colour that seems to belong to it, when a coloured substance is seen athwart it. After having described the various modes in which the mind may appear changed into the likeness of what it ponders, the author of this system then proceeds to explain the practical Yoga, by which 'concentration' may be attained. It comprises, according to him, mortification, the muttering of certain hymns, and a devoted reliance on the Lord. Through it, meditation is established, and *afflictions* are got rid of. By afflictions, again, he understands ignorance, egotism, affection, aversion, and tenacity of life; which terms are then the subject of an especial investigation into the nature of what is to be got rid of, of what is not desired to be got rid of, of what is constituted by the cause, and of what is the constitutive cause.—There are eight means or stages subservient to the attainment of concentration—viz., forbearance (*yama*), religious observance (*niyama*), postures (*āsana*), regulation of the breath (*prāṇāyāma*), restraint of the senses (*pratyāhāra*), steadying of the mind (*dhāraṇā*), contemplation (*dhyāna*), and profound meditation (*samādhi*).—The first stage, *forbearance (yama)*, consists in not doing injury to living beings, veracity, avoidance of theft, chastity, and non-acceptance of gifts; they are the universal great duty.—The second stage, *religious observance (niyama)*, comprises purity—external as well as internal—contentment, austerity, muttering of the Vedic hymns, and devoted reliance on the Lord.—The third stage of Yoga, *postures (āsana)*, is defined by Patanjali as 'that which is steady and comfortable' at the same time. The commentators mention several varieties of such postures. According to an interesting treatise on the Yoga philosophy by Navinachandrapala, one of these, called *Siddhāsana*, is practised by placing the left heel under the anus, and the right heel in front of the genitals, by fixing the sight upon the space between the eyebrows, and, while in this motionless attitude, meditating upon the mysterious syllable *Om* (q. v.). Of the posture called *Padmāsana* the same treatise says, that it consists in placing the left foot upon the right thigh, and the right foot upon the left thigh, in holding with the right hand the right great toe, and with the left hand the left great toe, the hands coming from behind the back and crossing each other; while the chin rests on the interclavicular space, and the sight is fixed on the tip of the nose. When the command of such postures is attained, Patanjali says, the Yogin does not suffer either from cold or heat, hunger or thirst, or similar afflictions.—The fourth stage, *regulation of the breath (prāṇāyāma)* is threefold, according as it concerns exhalation or inhalation, or becomes tantamount to suspension of the breath, the latter also being termed *kumbhaka* (from *kumbha*, a jar), because 'the vital spirits then are as motionless as water is in a jar.' Through such a regulation of the breath, the obscuration of the pure quality of the mind is removed, and the

latter becomes fit for acts of attention. Navinachandrapála describes different processes of the Prán'syáma as selected from different authorities. One, for instance, consists, according to him, in the act of inhaling through the left nostril for 7-6788 seconds, suspending the breath for 30-7152 seconds, and exhaling through the right nostril for 15-3576 seconds; then inhaling through the right nostril for 30-7152 seconds, exhaling through the right nostril for 7-6788 seconds, suspending the breath for 30-7152 seconds, and exhaling through the left nostril for 15-3576 seconds; lastly, inhaling through the left nostril for 7-6788 seconds, suspending the breath for 30-7152 seconds, and exhaling through the right nostril for 15-3576 seconds. To the *kumbhaka*, of which there are eight varieties, the same author observes, two processes are indispensable: sitting in one of the postures described; and, by means of an incision in the frantum linguae, and milking, as it were, the tongue, causing it gradually to become so lengthened as to allow the rima glottidis to be shut by pressing back the epiglottis with the point of the retroverted tongue. Such *kumbhaka*s, it is supposed, produce the most wonderful effects: some of them cure diseases of the head and lungs, dropsy, &c.; others make proof against all sorts of inflammation and fever; the eighth or last variety of the *kumbhaka*, especially, cures all diseases, purges from all sins, promotes longevity, enlightens the mind, and awakens the soul.—The fifth stage of Yoga, the *restraint of the senses (pratyádhára)*, means the withholding of the senses from their respective objects, and the accommodating them entirely to the nature of the mind. According to an authority quoted by Navinachandrapála, a Yogin's senses are suspended when he can suspend the respiratory movements for 10 minutes and 48 seconds.—This stage is preparatory to the sixth, or the *steadying of the mind (dháraná)*, which means the freeing of the mind from any sensual disturbance, by fixing the thoughts on some part of the body, for instance, on the navel or the tip of the nose. This stage, it is supposed, can be accomplished when the Yogin is able to suspend his respiratory movements for 21 minutes and 36 seconds; and, according to Navinachandrapála, it is effected by different processes—muttering the syllable *Om* 144,000 times, fixing the eyes upon the tip of the nose, or the space between the eyebrows, for two hours, swallowing the tongue for two hours, &c.—*Contemplation (dhyána)*, the seventh stage of Yoga, is the fixing of the mind on the one object of knowledge, the Supreme Spirit, so as to exclude all other thoughts. It is practised in consequence of the 'steadying of the mind,' as defined before; and, according to the authority quoted by Navinachandrapála, a man can accomplish it when he is able to suspend his respiratory movements for 43 minutes and 12 seconds.—The eighth and last stage of Yoga, *profound meditation (samádhi)*, is the perfect absorption of thought into the one object of meditation, the Supreme Spirit; it is devoid, as it were, of any definite character, which would suggest a term as applicable to it. In such a state, Navinachandrapála says, 'a Yogin is insensible to heat and cold, to pleasure and pain: he is insensible to blows and wounds, to the effects of fire; he is the same in prosperity and adversity; he enjoys an ecstatic condition. He is free from lust, fear, and anger; he is disengaged from all works. He is not affected by honour and dishonour. He looks upon gold, iron, and stones with the same unconcerned eyes. He is the same in love and in hatred; he is the same amongst friends and enemies.' And according to the authority he quotes, such a state may be

attained by a man who can suspend his respiratory movements for 1 hour, 26 minutes, and 24 seconds.—The last three stages are also comprised under one distinctive name, *Sam'yama*, or 'restraining,' because it is chiefly on the perfection attained in these three collectively that depend the wonderful results which are promised to a Yogin when he applies them to the contemplation of special objects. Such results are, for instance, a knowledge of the past and future, a knowledge of the sounds of all animals, of all that happened in one's former births, of the thoughts of others, of the time of one's own death, a knowledge of all that exists in the different worlds, of stars and planets, of the structure of one's own body, &c. There are especially, however, eight great powers which a Yogin will acquire when properly regulating and applying the *sam'yama*—viz., the power of shrinking into the form of the minutest atom; that of assuming a gigantic body; that of becoming extremely light; that of becoming extremely heavy; that of unlimited reach of the organs (as touching the moon with the tip of a finger); that of irresistible will; that of obtaining perfect dominion over the inner organs of the body; and that of acquiring mastery over everything. If the Yogin applies *sam'yama* to the contemplation of the smallest divisions of time, and the successive order in which such divisions occur, he obtains a discrimination which enables him to understand the subtle elements, and to see all objects at once. When his intellect has become free from all considerations of self, and his spirit is no longer subject to the result of acts performed, and when both have thus attained the same degree of purity, the Yogin obtains eternal liberation.—In the last chapter of his work, Patanjali then shews that these perfections are not always obtained by Yogins in one birth, but that *Prak'riti*, or nature (see SÁIKHYA), generally in a succession of births, brings to maturity the result obtained in a prior birth. He thus makes nature, not actions, the cause of each effect; meritorious actions merely serving, according to him, to remove the obstructions which, from bad actions, would arise to its regular progress, just as water would take its natural course after the husbandman, who would want to lead it from field to field, had removed the obstructions that lay in its path. After having then taught that the result of actions, in successive births, consists in the recollection of a prior state, and in the obtaining of a special (existence, a special duration of life, and special enjoyments); and after having discussed the different influences to which the mind may become subject in its union to different objects, Patanjali winds up with describing the mode in which final liberation gradually takes place. First, he says, when a person has obtained the discrimination conveyed by the Yoga doctrine, all ideas of self—such as, I am different from another—cease. In consequence, thought is turned inward, and this is the commencement of liberation. But, as still recollections, derived from former existences, sometimes prevail in his mind, they must be abandoned by him in the same way as he has to overcome the afflictions, above specified. When he has succeeded in this, his knowledge will have become so infinite, that but little will remain for him to be known. Then the cosmical *gun'as*, or qualities, too (see SÁIKHYA), having accomplished the main object of spirit, will have gradually arrived at the end of their functions, and, as a consequence, matter will become separated from spirit. This is *kasálya*, or true liberation, for the mere power of the mind to retain its nature after dissolution has taken place, is not yet true liberation.—The practical part of the Yoga was admitted into the later Vedánta (q. v.). Its ethical

portion is especially dwelt upon in the celebrated episode of the Mahābhārata (q. v.), the *Bhagavadgītā*. But the great power it has at all periods exercised on the Hindu mind, is less derived from its philosophical speculations or its moral injunctions, than from the wonderful effects which the Yoga practices are supposed to produce, and from the countenance they give to the favourite tendency of orthodox Hinduism, the performance of austerities. It is needless, however, to say that frequently these practices were and are merely a cloak for imposture and hypocrisy, and that the professional Yogins (q. v.), numbers of whom are met with throughout India, are often nothing but lazy mendicants or jugglers, who, by impressing the vulgar with a belief in their supernatural powers, convert it into a source of an easy livelihood. Such followers of the Yoga pretend, for instance, to foretell future events; they deal in palmistry, and profess to cure diseases. There are instances, too, where, for a handsome consideration, they allow themselves to be buried for a certain time, so as to exhibit the power of the Yoga. Two such cases are related as authentic in the treatise of Navinachandrapāla; and it would appear from them, that a human being, after having undergone certain preparations, such as the Yoga prescribes them, may be shut up in a box without either food or drink, for the space of a month, or even forty days and nights, and yet remain alive. The author of the treatise endeavours, indeed, to shew that the rules laid down by the Yoga regarding the mode of respiration, the postures, and the diet of a Yogin, may have been founded on a careful observation of the nature and habits of hibernating animals; and in support of this view, he enters into a detailed investigation of the effect of the Yoga practices on animal life. If, as it seems, his statements are correct, much of what otherwise would be incredible in the accounts given of the performances of Yogins, could be received as true, because admitting of explanation. The system of *Patanjali* was taught by him in a little work called *Yogasūtra*, which consists of four Pādas, or chapters, each comprising a number of Sūtras (q. v.). The oldest commentary on it is ascribed to a *Vyāsa* (q. v.); and this was commented on by *Vaśaspati-Miśra*. Of other commentaries, those by *Vīdanabhikṣu*, *Bhojadēva*, and *Nāgojibhāṭa* are the most approved of.—For a fuller enumeration of works on the Yoga, see *A Contribution towards an Index to the Bibliography of the Indian Philosophical Systems*, by Fitzedward Hall (Calcutta, 1859). The first two chapters of the Sūtras have been translated, with annotations, founded on the commentary of Bhojadēva, by the late J. R. Ballantyne (Allahabad, 1853); and a paraphrase, but somewhat too free, of the same commentary is contained in the 4th vol. of William Ward's *Views of the History, Literature, and Religion of the Hindus*, &c., 4 vols. (London, 1817—1820). For a brief account of the system, see also the 1st vol. of H. T. Colebrooke's *Miscellaneous Essays*, 2 vols. (London, 1837); and for the practice of the Yoga, *A Treatise on the Yoga Philosophy*—that referred to above—by N. C. Paul (i. e., Navinachandrapāla), (Benares, 1851).

YOGIN, a follower of the Yoga system of Hindu philosophy (see YOGA), but in popular acceptance a term generally denoting a Hindu ascetic or devotee, a man who has entered the fourth stage of religious life as described in the S'āstras. A large class of such persons forms a division of the votaries of Śiva. See ŚAIVAS.

YOKOHAMA (meaning, as written by the Japanese, 'Cross Shore'), a town of Japan, in the

island of Nipon, the foreign mercantile settlement of Yeddo, and the head-quarters of the plenipotentiaries of the treaty powers. It is situated on the south side of a bight of the Bay of Yeddo, about 17 miles from Yeddo, and opposite to Kanagawa.

Y. was substituted (1859) by the Japanese for Kanagawa, the treaty port, which is on the Tocado, or great highway, as the residence of the foreign mercantile community, on account of its greater isolation and distance from the route of the hostile daimios, or territorial princes. The Japanese government built, at a great outlay, solid granite piers and landing-places, a large custom-house, official residences, and shops for Japanese traders; besides houses and godowns for the foreign community and merchants. Y., which in 1854 was a small fishing-village, extends along the sea-shore for about a mile and a half, and is two or three streets deep. The pop. exceeds 20,000. The custom-house is nearly in the centre of the town; and east and west of it, lie respectively the foreign and native quarters. The shops are filled with goods to suit the foreign taste—such as lacerated ware of rare quality and bronze-work, baskets and porcelain, fancy silks and embroidery, curiosities and articles of vertu. A causeway across the marshy ground connects Y. with the high road at Kanagawa. A deep canal is drawn as a cordon around the settlement on the land-side, which cuts it off most completely from easy access to the surrounding country, and at every point of egress or ingress is a guard-house, thus placing the whole community most effectually under the watchful and jealous eye of the government.

YONGE, CHARLOTTE MARY, a novelist of considerable merit and popularity, was born in the year 1823. She is a daughter of the late William Crawley Yonge, Esq. of Otterbourne, Hampshire, sometime an officer in the 52d Regiment. The work by which she is best known is *The Heir of Redclyffe*, which had great success, and has gone through several editions. Besides this, she is the author of *Heart's Ease*, *Dynevor Terrace*, *The Daisy Chain*, *The Lances of Lynwood*, *The Little Duke*, &c. These works exhibit much literary accomplishment, and have secured for Miss Y. a public of her own. The spirit which pervades them is pure, amiable, and pious; and commonly the stories are more or less contrived as vehicles of the High-Church opinions to which the writer is warmly attached. Considerable sums accruing from the sale of her writings she is said to have devoted to the aid of religious missions in New Zealand. In addition to the fictions by which she is chiefly known, Miss Y., in 1863, published in two vols. a work *On Christian Names, their History and Derivation*, in which much curious erudition is displayed.

YONKERS, a village of New York, U. S., on the east bank of the Hudson River, 17 miles north of New York City, from which it is accessible by rail and steamboat, filled with beautiful residences, villas, and cottages. It has six churches, male and female academies, and several manufactories. Pop. about 7000.

YONNE, a department in the north-east of France, bounded on the N. by the department of Seine-et-Marne, on the E. by Aube and Côte-d'Or, on the S. by Nièvre, and on the W. by Loiret. Area, 2868 sq. m.; pop. (1866) 372,589. The department is watered by the river Yonne, which flows across it in a north-east direction. The surface is hilly, many of the hills being covered with fruitful vineyards, the intervening valleys being beautiful and fertile. The vineyards yield annually upwards of 22,000,000 gallons of wine.

There are some fine forests in the department. The climate is generally healthy, except in the south-west, where the marshes often give rise to fever. The soil produces abundance of grain, but the cultivation of the vine is of the greatest importance, the best wines produced here being those of Chablis, Joigny, Auxerre, and Tonnerre. The chief mineral products are red granite, marble, lithographic stones, pavement, red and yellow ochre, iron. There are manufactures of cottons, woollens, beet-root sugar, bricks, tiles, &c. The chief exports are timber, corn, and wine. It is divided into five *arrondissements*—viz., Auxerre, Avallon, Joigny, Sens, Tonnerre. The railway from Paris to Lyon passes through the department. The capital is Auxerre; the other chief towns are Avallon, Joigny, Sens, and Tonnerre.

YORK, HENRY BENEDICT MARY, DUKE OF, Cardinal, and Bishop of Frascati, the last male descendant of the royal House of Stuart, was the second son of James (III. of England), commonly known as the Pretender. He was born at Rome, March 26, 1725; and after the failure of the attempt of his elder brother, Charles Edward, in 1745, resolved to enter the church. He was admitted to tonsure and minor orders by Benedict XIV., and created Cardinal in 1747. Clement XIII. consecrated him Bishop of Corinth in *partibus infidelium*, and afterwards of the suburban see of Frascati, where he took up his residence. He also enjoyed, through the favour of the crown of France, the revenues of two abbeys, which he held in *commendam*, as well as a pension from the Spanish court; and the liberal charity with which he dispensed his income among the poor, and for the other charitable and religious necessities of his diocese, endeared him to his flock. These resources were lost at the Revolution; but, nevertheless, in the distresses of the holy see which ensued, Cardinal Y. sold his family jewels for the purpose of relieving Pius VI. in his necessities. On the occupation of Rome, he withdrew to Venice; but he returned in 1801, on the restoration of the papal authority under Pius VII. George III., having become aware of the failure of his former means of income, granted him a pension of £4000 a year, which he accepted, and enjoyed till his death. Those to whom a printed record of the 'Last of the Stuarts' may be interesting, will find a small collection of his 'Pastoral Letters,' in a 4to volume published in Rome, and entitled *Appendix ad Tusulanam Synodum a Celsitudine Regia Emmentissimi Henrici Episcopi Tusculani* (Rome, 1764). He was appointed by Pius VII. Dean of the Sacred College, and held several other dignities, and was much respected, as well by the Italians as by foreigners visiting Rome. He died at Frascati, July 17, 1817, at the advanced age of ninety-two. His last will, which is a very interesting document, is printed by Artaud in his *Vie de Pie VII.* His monument, by Canova, in St Peter's, was erected by order of the Prince Regent, afterwards George IV.

YORK, HOUSE OF. See PLANTAGENET.

YORK, the capital of Yorkshire, is situated at the junction of the rivers Ouse and Foss, the three Ridings of the county meeting at the same place, and is nearly equidistant from London and Edinburgh. It is the seat of an archbishopric, a county in itself, and a municipal and parliamentary borough. The government is vested in 12 aldermen and 36 councillors, of whom one, as in the case of London, is Lord Mayor. It returns two members to parliament. The pop. in 1861 was 40,377, being an increase from 1851 of 4074 persons, and 794 inhabited houses. Within the Poor-law Union of which Y. is the centre, there are 83 parishes, with

an area of 79,769 statute acres, and a pop. in 1861 of 59,158.

Y. is amongst the most ancient of British cities. Before the Roman invasion, it was one of the chief towns of the Brigantes, the most numerous and powerful of the British tribes. It was constituted a Roman station, under the name of *Eboracum*, by Agricola about 79 A.D., and was very soon the principal seat of Roman power in the north, perhaps in Britain. While the Roman dominion existed in the island, Y. was a city of the first importance. Here Hadrian lived and Severus died. Here, too, died Constantine Chlorus, the father of Constantine the Great, and here, as many believe, his greater son was born. When the emperors visited the province, Y. was their chosen residence, and it was the abode of the imperial legates when the emperors were absent. Little is known of the city for a century after the departure of the Romans, about 409 A.D., but it certainly suffered much during the long conflict between the Britons and the Picts, against whose incursions Y. was a material defence. It afterwards became the capital of Northumbria. The first metropolitan church in England was built here by Edwin, the Northumbrian king whom Paulinus baptised; and here also Edgar, the first sole monarch of England, held, in the year 966, the Witenagemot. William the Conqueror was long unable to overcome this stronghold of the north, notwithstanding his coronation by its archbishop, Aldred. One Norman garrison, numbering 3000 men, was put to the sword in 1069; but William exacted a terrible vengeance in the following year, when he laid waste the whole country between Y. and Durham.

The first English parliament was held at Y. in 1160 by Henry II., and for 500 years afterwards parliaments continued to be summoned occasionally to the ancient city. Under Henry III., the courts of King's Bench and Exchequer sat at Y. for seven years; and for a few months, Richard II. removed thither the courts of King's Bench and Chancery. During the insurrections consequent upon the dissolution of the monasteries by Henry VIII., Y. was seized by the insurgents of the 'Pilgrimage of Grace,' and in its immediate neighbourhood, Fairfax, in 1644, conquered Prince Rupert on Marston Moor. Typical of a very different time and order of things is the fact that the British Association for the Advancement of Science was first organised at Y. in 1831.

A city so ancient necessarily presents many interesting memorials of antiquity. There are remains or memorials of Roman towers and temples, and of the earliest British churches. One of the most magnificent of the Anglo-Saxon churches was erected at Y. in the 8th c., and this, destroyed by fire, rebuilt, enlarged, and changed from time to time, is now known as York Minster. A portion of the original church was disinterred during the excavations which followed the latest burning of the minster, in 1829. The present structure takes rank with the finest specimens of Gothic architecture in the world. It was mainly built in the 13th and 14th centuries. Its length, from base to base of the buttresses, is 524 feet, and its extreme breadth 250 feet, being 24 feet longer than St Paul's Cathedral, and 149 feet longer than Westminster Abbey. The magnificent east window is 75 feet high and 32 feet broad, and contains about 200 compartments, each a yard square, representing scriptural subjects. War and fire have conspired to deform or destroy this splendid cathedral. Twice it has been burned down, once in 1069, and again in 1137, each time to rise more beautiful than before. During the times of the Commonwealth, much damage was done by

war and wantonness, and several of its older monuments were mutilated or broken up. In 1829, it was set on fire by Jonathan Martin, a maniac; and the roof of the choir, 222 feet long, with all the woodwork on each side, was destroyed. While this disaster was being repaired, a workman's candle was carelessly left burning, one night in 1840, and again a terrible fire broke out, destroying the south-western tower, with its splendid peal of bells, and the roof of the nave. The cost of the repairs exceeded £100,000.

A monastery of Benedictine monks was built, or rather completed, at Y. in the time of William Rufus, which was in great part reconstructed about the end of the 13th century. Its abbot had a mitre and a seat in parliament. Some portions of the original building yet remain. Thirteen seceders from this monastery established, in 1131, the neighbouring Abbey of Fountains, near Ripon, under Cistercian rule. On the site of the Benedictine monastery now stand the museum and gardens of the Yorkshire Philosophical Society. The same order had a priory dedicated to the Holy Trinity in Mickle-gate, and a nunnery outside the walls at Clementhorp. Besides these, the Dominicans, Franciscans, Augustinians, and Carmelites had each a monastery, and the Gilbertines a priory, within the city. In the immediate neighbourhood were 16 hospitals. At the Reformation, Y. contained 41 pariah churches, 17 chapels, 16 hospitals, and 10 religious houses. Twenty-two of the churches yet remain, and several new churches and chapels of ease have been built in or near the city. The Roman Catholics have two chapels, and the various bodies of dissenters, 14.

The educational institutions of Y. are numerous and useful. Notable among them are St Peter's School, founded in 1557; Archbishop Holgate's Free School, dating from Henry VIII.; the Blue Coat School for boys, and the Gray Coat for girls, supported chiefly by annual subscriptions; the York Collegiate School (proprietary); the York and Ripon Diocesan Training-school for Masters; and the Yorkshire School for the Blind, dedicated to the memory of William Wilberforce, and conducted in a palace originally built for the Lord President of the Council of the North.

The Yorkshire Philosophical Society was formed in 1822, and possesses a handsome building and gardens on the site of the ruined St Mary's Abbey, with a museum, rich in antiquarian relics and specimens illustrative of natural history. Among other public institutions are the County Hospital, the first established in England north of the Trent; the Lunatic Asylum; the Dispensary; the Friends' Retreat; and very many charitable foundations for the benefit of poor persons. The ancient castle, with the exception of its imposing Clifford's Tower, is superseded by the modern and commodious assize courts. The Guildhall, a fine Gothic building, was erected in 1446. There are also convenient assembly and concert rooms, and a creditable theatre.

Whatever the trade of York may have been in ancient times—and old writers speak of it in glowing terms—it counts for little now. The making of leathern gloves, combs, glass, &c., supplies employment to many; some find employment in iron-foundries, in flax-spinning, and the manufacture of linen; and of late, the construction of railway carriages has become part of the city industry.—See Drake's *Eboracum*; Brown's *History of the Metropolitan Church of St Peter's, York*; Britton's *Cathedral Antiquities—York*; Hargrave's *History of York*; Gent's *York*; Wellbeloved's *Eboracum, or York under the Romans*.

YORK, a shire-town of Pennsylvania, on Codorus Creek, 10 miles south-west of the Susquehanna

River, 28 miles south-south-east of Harrisburg, at the intersection of several railways. It has a spacious granite court-house, numerous churches, handsome residences, three banks, four newspapers. Pop. in 1860, 8605.

YORK, a river of Virginia, formed by the union of the Pamunkey and Mattaponi, flowing south-east to the Chesapeake Bay, nearly opposite Cape Charles. It is 40 miles long, and from one to three miles wide. Yorktown, an ancient but decayed port, on the right bank, eleven miles from its mouth, was the scene of Lord Cornwallis's surrender, October 19, 1781.

YORKSHIRE, which is larger in territorial extent than any other two counties in England, is situated nearly in the centre of Great Britain, about midway between London and Edinburgh. 'Its extreme points,' says Allen, in his History of the county, 'lie between the parallels of 53° 18'—54° 40' N. lat., and between 2° 40' of W.—0° 10' of E. long. from Greenwich. On the N. side, it is separated, in its whole extent, from the county palatine of Durham by the river Tees; from the mouth of the same river to the entrance of the Humber, the whole E. side is bounded by the German Ocean; on the S. side it is divided from Lincolnshire by the rivers Humber and Trent. The boundaries between Y. and the counties of Nottingham, Derby, Cheshire, Lancashire, and Westmoreland are merely conventional, being indicated by no natural feature of the country.' The longest diagonal of the county, north-west to south-east, extends about 130 miles; the shortest, south-west to north-east, about 90. It contains about 5983 sq. m., or above 3,820,000 statute acres. It is divided into three Ridings, North, East, and West, and a small district not included in any of the three, the Ainsty of York. The Ridings (a corruption of tri-thing or thirding), date back to Saxon times, and are peculiar to Yorkshire. Each has a separate military and civil jurisdiction, and each its own lord-lieutenant and public buildings. The North Riding contains 11 wapentakes; the East, 7; the West, 11. In the whole county, besides the archiepiscopal city, there are 59 market-towns, 60 poor-law unions, and 1500 parishes and townships. The North Riding returns 2 county and 9 burgh members to parliament; the East Riding, 2 county, and 6 burgh members; the West Riding, 4 county, and 14 burgh members; and the city of York, two members—making a total of 39. According to the census of 1861, the pop. of Y. was 2,015,541, of whom 991,826 were males, and 1,023,715 females. Three-fourths of the whole number were resident in the West Riding. In the ten years 1851—1860, there were registered in the whole county 168,609 marriages, 695,439 births, and 439,313 deaths.

The history of the county in early times may be mainly read in that of its chief city. Apart from the events which transpired at, and in connection with York, there is little to be recorded. It was originally occupied by the Brigantes, and was subjected by the Romans under Agricola about 71 A. D. When the Roman occupation ceased, it was long and greatly troubled, first by Pictish, and then by Saxon incursions. Under Saxon rule, the traces of Brigantian occupancy were soon obliterated, only the rivers, mountains, and a few remarkable natural curiosities retaining their British names, while all things else received Saxon designations. The county formed part of the kingdom of Northumbria, taking the name of Deira (the Country of Deer), when that kingdom was divided. In the troublous times which preceded the Conquest, many battles were fought against invading Danes, and generally with success.

At Stamford Brig, a few miles from York, Harold, the last of the Anglo-Saxon kings, defeated the united Danish and Norwegian armies, three weeks before he fell before the Normans on the fatal field of Hastings. Among the more notable events of later history, may be named the battle of Wakefield, where the Duke of York was defeated by Queen Margaret in 1460; the battle of Towton Field, near Tadcaster, fought on Palm Sunday in 1461, the most sanguinary conflict of the bitter war between the rival Roses; and that of Marston Moor, which gave the final blow to the falling fortunes of Charles I. Since that time, with slight exceptions, the history of Y. has been one of peace and prosperity.

The surface of the county is greatly diversified. On its north-western border runs a range of lofty hills, many of them containing extensive caverns, and giving birth to wild and romantic streams. Here is Ingleborough, 2361 feet above the sea-level, with its marvellous cave, half a mile long, full of beautiful stalactites; Wharfedale, 2384 feet high, with its subterranean cataract of 75 feet in Weathercote Cavern; and the vast mass of Micklet Fell, 2000 feet, which overlooks the waters of the Tees and Lune. Eastward, far away, rise the Hambleton and Cleveland Hills. Lower down are the Wolds, a line of chalk hills stretching from Flamborough Head to Ferriby on the Humber. The hills and dales of Craven, which cover a large tract of country in the west, abound in natural beauty. Right down the centre of the county, from the Tees to the Humber, runs the great Vale of York. Across its northern border flows the Tees. Coming southward, we find the dales of the Swale, the Ure, the Nidd, the Wharfe, the Aire, the Calder, and the Don, all on the western side of the county, each sending a river to the central vale, where the united waters, with the Derwent and a few smaller tributaries from the east, form the Ouse; while the Ouse, after uniting with the Trent, becomes the Humber estuary, which rolls eight-tenths of the Y. waters to the sea. The Ribbles, rising in Craven, passes by Preston, and falls into the Irish Channel, and is the only Y. river which finds a western outlet. The Esk joins the German Ocean at Whitby, and the Tees between Redcar and Hartlepool.

Geologically, Y. is too large a subject for us to do more than touch. The Vale of Y., rarely more than 100 feet above the sea, has on its western side the long low elevations which culminate in the Pennine chain, while on the east rise the lower but more sudden eminences of the Wolds and the high grounds of Hambleton and Cleveland. On the west are the millstone grit and mountain limestone, the two coming together in lofty opposing eminences in many parts of Craven, where, along the line of what is called by geologists the 'Craven Fault,' the limestone rises into magnificent cliffs many hundreds of feet in height, and nearly 2000 above the level of the sea. The limestone is in many places very rich in lead-ore. On the east lie the Chalk Wolds, and the Oolitic and Lias formations, with the Kimmeridge Clay of the Vale of Pickering, and the accumulations of sand, gravel, and other sediments which make up Holderness. In the south-western district is a splendid coal-field, intermixed with ironstone, extending over 600 sq. miles. Valuable deposits of iron ore have also been discovered recently in Cleveland, in the north-eastern part of the county.

In the north-west, the lower parts of the North Riding, Craven, and the East Riding, the land mainly supplies occupation to the inhabitants. Craven is almost purely a grazing district, and so are most of the upper lands and dales in the county. Excellent corn is grown in the vales of York and

Cleveland, and the East Riding has many large and excellent farms. The horses of Y., both for the race-course and for use, are too well known to need eulogy. The manufactures of the county are immense. Leeds is the centre of the woollen, as Bradford is of the worsted trade. Sheffield is the principal seat of the cutlery manufacture; while the Cleveland district is rapidly rising into importance for mineral wealth and enterprise. The large iron-works of Low Moor, Bowling, and Rotherham, and the flax and linen manufactures of Leeds and Barnsley, merit a passing notice, with the blankets and cloths of the Huddersfield district, and the new llama and alpaca industry introduced at Saltaire near Bingley, by Mr Titus Salt. Harrogate, Ilkley, Aakern, and Croft are the principal inland health-resorts of the county; Scarborough, Filey, Bridlington, and Whitby take the lead on the coast.

The public works of Y. rank with the finest in the kingdom. Among them are the Aire and Calder Navigation, 15 miles long; the Calder and Hebble Navigation; the navigation of the Don and Sheffield region, 40 miles; and the Huddersfield Canal, one of the most surprising engineering works in England. This canal is 20 miles in length, and rises between Huddersfield and Marsden by 42 locks to the height of 656 feet. At this elevation, the highest canal-level in the country, it passes by a tunnel more than three miles long under Standedge, a range of hills between Marsden and Saddleworth. The canal terminates near Dukinfield. Add to these the Leeds and Liverpool Canal—which cost 46 years of labour, and is 129 miles long—besides many smaller, but very costly undertakings, and some idea may be formed of the activity of Y. in this direction. Its railway communications are excellent, and grow in number and completeness every year. On these lines, in consequence of the mountainous districts through which many of them pass, are to be found some of the longest and most difficult tunnels, viaducts, bridges, embankments, and cuttings which have yet been attempted by engineers in England.

A very brief reference to the antiquities and natural curiosities of the county must suffice. Traces of great Roman roads are found in many places, as well as of Roman, Saxon, and Danish encampments. In the Wolds are many tumuli; and it is supposed by some that the singular and imposing mass of rocks called Brimham Crag, which overlook Niddedale, about four miles from Pateley Bridge, was once a Druidical temple. The ruins of ancient abbeys and priories are numerous and beautiful. Few can rival the glories of Fountains and Rievaulx, and the scenery which encompasses Bolton Priory is delightful. Besides these, there are the ruins of Kirkstall, Roche, and Selby in the West Riding; St Mary's at York; Jervaux, Byland, and Whitby in the North Riding; and many others. Of castles, we may name in the West Riding, Conisborough Castle, near Doncaster, one of the oldest and most interesting ruins known to antiquaries; Knareborough, Pontefract, and Skipton, the last still used as a residence; in the North Riding, Richmond, with its unrivalled Norman keep; Middleham Castle, where the king-maker, Warwick, lived, and where Edward IV. was immured; and Bolton Castle, the prison for a time of Mary Queen of Scots; in the East Riding, Wressle Castle, once the home of the Percies. Of old York Castle, nothing now remains but its massive Clifford's Tower.

The lover of the picturesque will find the Y. scenery full of charms. The rapid of Caldron Snout, on the Tees, 200 feet in descent; High Force, on the same river, a perpendicular fall of 69 feet over a cliff of greenstone marble; Aygarth

Force and Hardraw Force, on the Ure; the Strid, immortalised by Wordsworth, in Bolton Woods on Wharfe; the magnificent Gordale Scar and Malham Cove, each nearly 300 feet in height, on the upper waters of the Aire; and the uncounted glens and streams among its myriad hills, are sufficient to indicate the attractions of its river and mountain aspects. It would require a volume to do them justice.

YOU'GHAL, a seaport, parliamentary, and municipal borough of the barony of Innakilly, county of Cork, Munster, Ireland, situated in lat. 51° 57' N., long. 7° 52' W., on the estuary of the Blackwater, 157 miles south-west from Dublin. The pop., which, in 1851, was 7410, was in 1861, 6328. The town is built with considerable regularity, and has some structures of interest, especially the parish church, which is formed of the nave and aisles of the ancient collegiate church, built by the Earl of Desmond in 1464; the 'clock-gate,' which separates the northern from the southern division of the town; and Sir Walter Raleigh's house, now called Myrtle Grove, which remains, with little alteration, to this day. There is a handsome Roman Catholic church, as also churches of the several other denominations; two convents; several schools, endowed, conventual, and national; a fever hospital, a lying-in hospital, and several other benevolent institutions. The trade of Y. is considerable, but lies chiefly in the export of agricultural produce. The harbour, which is obstructed by a bar, does not admit vessels of more than 400 or 500 tons burden; but the fisheries are extensive and valuable, and employ a considerable number of hands. There are several remains of buildings, civil, ecclesiastical, and military; and, according to the local tradition, the potato was first planted at Y. by Sir Walter Raleigh, after it was brought from America. Y. returns one member to the imperial parliament. The constituency in 1863 was 267. Its municipal affairs are managed by commissioners, 21 in number.

YOUNG, ARTHUR, an eminent writer on agriculture, was born September 7, 1741, and educated at Lavenham in Suffolk. In 1758, he was apprenticed by his father, a doctor of divinity and clergyman of the Church of England, to a mercantile house in Lynn. But Y. had no liking for business, and devoted much of his attention to literature. On his father's death, in 1759, he undertook the management of a small farm, of which his mother had a lease. Six years afterwards, he became a farmer on his own account in Essex. He seems, at the same time, to have acted as a parliamentary reporter; and as he only saw his farm from Saturday till Monday, it need not be wondered that he found it unprofitable. At the end of five years, he gave £100 to a practical farmer to take the lease off his hands. In the meantime, however, he had made notes of the results of numerous experiments on his farm, which he afterwards published, under the title of *A Course of Experimental Agriculture*. His first successful book was, *A Tour through the Southern Counties of England*, which was followed by other works describing the state of agriculture in various parts of England, and in Ireland. The enthusiasm of Y., and his lively style, made his writings popular, and by them the knowledge of many judicious practices, confined to one locality, was spread throughout the whole empire. In 1784, Y. began the publication of the *Annals of*

Agriculture, of which 45 vols. 8vo were published. Three years later, he was invited by Count de la Rochefoucauld to make a tour in the south of France. What he saw, induced him to undertake a series of tours in France, through a great part of which he travelled leisurely on horseback. The result was his most important work, *The Agricultural Survey of France*. The author did not confine his attention to agriculture, but described the social and political condition of the people in a lively and truthful manner, and his work has become, in consequence, the most reliable source of information regarding the state of France just before the Revolution. In 1801, the French Directory shewed the value attached to the writings of Y., by ordering the whole of his agricultural works to be translated into French. They were published at Paris, in 20 vols. 8vo, under the title of *Le Cultivateur Anglais*. In 1808, Y. received a gold medal from the English Board of Agriculture, 'for long and faithful services in agriculture.' He died April 12, 1820.

YOUNG, BRIGHAM, American Mormon leader, was born at Whittingham, Vermont, June 1, 1801, and was the son of a small farmer proprietor. In 1832, having become converted to Mormonism, he was made an elder of the Church of the Latter-day Saints, and began to preach at the Mormon settlement at Kirtland, Ohio. In 1835, he was appointed one of the twelve apostles of the Church, and sent as a missionary to the New England States, where he was very successful in making converts. After the Mormons had been driven from Kirtland to Missouri, and from the latter to Illinois, and the murder of Joseph Smith by a mob (1844), Y. was chosen President in his place. The year following, the charter of Nauvoo was repealed by the legislature of Illinois; and after a cannonade of three days, the Mormons were driven from their capital and temple, and led by President Y. to Utah, where they arrived, after a long and toilsome journey across the plains, July 24, 1847. Next year, the great body of Mormons arrived and founded Salt Lake City; and at the establishment of the territorial government in 1849, President Fillmore appointed Brigham Y. governor of the Territory. Next year, the United States judges were driven away, the governor removed, and Colonel Steptoe appointed in his place; but on visiting Utah in 1854, he thought it an unsafe residence, and resigned; the Mormon President exercising supreme authority, and saying: 'I am and will be governor, and no power can hinder it until the Lord Almighty says: "Brigham, you need not be governor any longer."' A new governor, Cumming, was however appointed, and sent with a force of 2500 United States troops to protect him and the Federal officers; but Y. forbade it to enter the territory, cut off the supply-trains, while the troops were reduced to straits by being overtaken by snow in the mountains. A compromise was, however, effected, the Mormons pardoned, and the troops remained until 1860, Brigham Y. still (1867) retaining the presidency of the Church, assisted by Heber C. Kimball and Daniel C. Wells, with 12 apostles, and two bodies of the priesthood, and maintaining, by the energy and prudence of his character, an almost unlimited authority. See MORMONS, SALT LAKE CITY, and UTAH.

YOUNG, EDWARD, the author of the well-known *Night Thoughts*, was born in the year 1684, at Upham, in Hampshire, of which parish his father was at that time rector. He was educated at Winchester School, and afterwards, in 1703, went to Oxford. In 1708, a law fellowship in All Souls

College was conferred on him by Archbishop Tenison. With law, however, he seems pretty much to have declined to meddle, occupying himself, by preference, with poetry and religious studies. In 1714, he obtained his degree of B.C.L.; and that of D.C.L. followed in 1719. Meantime, he had come before the world as a poet, by publishing, in 1713, an *Epietle to George, Lord Lansdowne*, on his being created a peer. For Y., who continued through life one of the most persevering and audacious toadies that ever flattered a patron, this was a characteristic beginning. In the same year, he also published two other poems of some length, entitled respectively *The Last Day*, and *The Force of Religion, or Vanquished Love*; the year following, he again flowed forth in *A Poem on the Death of Queen Anne*. These performances procured him some amount of immediate reputation. In 1719, he ventured on the more ambitious effort of a tragedy, which, under the title of *Busiris*, was brought out at Drury Lane. The piece had a fair success, through which means it probably was that he attracted the notice of the strange and eccentric Duke of Wharton, with whom, in the end of that year, he was induced to go for a short time abroad. The duke seems to have entertained for him a real kindness, and to have treated him with much liberality. At the duke's death, Y. set forth certain claims against his estates, which he succeeded in making good to the extent of an annuity of £200. The details of the case are perplexed, and need not here be entered into. They involve nothing dishonourable to Y., yet convey a somewhat unpleasing impression that the pious author of the *Night Thoughts*, in his extreme solicitude about the next world, contrived to keep a pretty sharp eye to his little pocket-interests in the present one. In 1721, was produced his tragedy, *The Revenge*, which, though unsuccessful at the time, has since had greater acceptance, and is the only one of his pieces still occasionally acted. His third and last attempt in this field, *The Brothers*, was produced in 1753. Between 1725 and 1728, appeared in succession his satires, under the title of *The Love of Fame, the Universal Passion*. These had a great success, and brought to their fortunate author money as well as fame. They abound with wit and vivacious observation, and even now will very well repay perusal. Of *The Instalment*, a poem, issued in 1726, and addressed to Sir Robert Walpole on his being made a Knight of the Garter, it seems enough to say, that inasmuch as we incidentally hear from Swift of a pension granted him, we may surmise that this was the service to the public by which he had contrived to earn it. In 1727, Y., having taken holy orders for the purpose, was appointed one of the royal chaplains; and in 1730, he became rector of Welwyn, in Hertfordshire. The year after, he married Lady Elizabeth Lee, daughter of the Earl of Lichfield, and widow of Colonel Lee. He is supposed to have been very happy with her, as he exhibited great grief on her death in 1741. It is believed that from his solemn meditations on the event, he got the suggestion of the *Night Thoughts*, begun shortly after, and published 1742—1746. By this work almost solely it is that he has continued to be remembered. His mind retained its activity to the last. He published various other works, now so entirely forgotten, that it would be waste of time to enumerate them; and in 1762, superintended a collected edition of his works, in 4 vols. 12mo, from which he had the grace to exclude certain of the most fulsome of his dedications, probably as having served their turn, and not likely to be of further use. His death took place on April 12, 1765. Since that time, his *Night Thoughts* has

passed through editions innumerable, and is more or less familiar to every reader. It displays much gloomy force of pious reflection; and has passages of fine imagination, frequently somewhat marred by an epigrammatic mannerism of expression. Certain of its sententious lines have passed into common use, and become in a manner proverbial. Though now somewhat declined from the estimation in which he was long held, Y. must continue, on the strength of it, to hold a distinct and even high place in that interval in our literature which divides the artificial and so-called classical school of Pope from the return to a simpler and more natural manner, heralded some time afterward by Cowper. If we except his one great weakness of character—an inordinate appetite for preferment and worldly honours, which sought its gratification in ways somewhat servile and unworthy—there seems every reason to believe that Y. was, on the whole, a very excellent and worthy man, and sincerely devout Christian.

YOUNG, THOMAS, M.D., one of the most ingenious and original philosophers of this century, and almost as eminent for his scholarship and his linguistic discoveries, as for his contributions to science, was born at Milverton, in Somersetshire, on the 13th of June 1773. His parents, Thomas and Sarah Young, were Quakers of the strictest sect; and Y. had the impression that the peculiar doctrines of the Quakers had a favourable influence upon his character and career. In particular, he connected with the Quaker doctrine of divine suggestion the perseverance with which he followed up any pursuit in which he engaged, to which he, like Buffon, was disposed to attribute all the discoveries which his genius enabled him to make. Wonderful stories of his youthful precocity have been recorded, and they seem to have more truth in them than such stories usually have. In 1780, he was sent to a boarding-school at Stapleton, near Bristol, where he remained two years; he was afterwards put to a school at Compton, in Dorsetshire, kept by a Mr Thompson, who appears to have been an able and judicious teacher. When he left Compton, in his 14th year, besides having a great knowledge, for his age, of Greek and Latin and of Mathematics, he had learned French and Italian, and, without any tuition, had made considerable progress in Hebrew, Persic, and Arabic. In 1787, he went to live with Mr David Barclay of Youngsbury, near Ware, in Hertfordshire, an eminent member of the Society of Friends, partly as the fellow-pupil, partly as the tutor of that gentleman's grandson, Hudson Gurney. A Mr Hodgkin was called in to assist the studies of the two lads, but Y. soon proved to be superior in acquirements to his instructor, and virtually the three became fellow-students. Mr Hodgkin published in 1793 a work entitled *Calligraphia Græca*, which he dedicated to Young. Y. continued to live with Mr Barclay till 1792, spending the summer months in Hertfordshire, and the winter in London, studying Greek and Latin, the modern languages, the Oriental as well as the European, the higher mathematics, and natural philosophy, and, by way of amusement, botany and zoology. He taught himself to write Latin with fluency and elegance, and to write Greek verses, which received the commendation of some of the best judges of the time. During the winters of 1790 and 1791, he attended lectures on chemistry in London. It may be remarked, that neither then nor at any subsequent time did he shew much disposition towards experimenting; his bias seems to have been towards the pure rather than the observational sciences.

Towards the end of 1792, under the advice of Dr Brocklesby, an eminent London physician, his

mother's uncle, who had been greatly impressed by his abilities and attainments, he began to study medicine; and he attended medical lectures for two years in the schools of London, and afterwards for a year at the University of Edinburgh. After going to Edinburgh, Y. gave up the Quaker dress and the more inconvenient of the Quaker customs; he took lessons in music and dancing, mixed freely in society, and occasionally went to the theatre. These changes, though not intended to go further, eventually led to his complete estrangement from the Society of Friends. From Edinburgh he went to the German university of Göttingen, from which, after nine months' residence, he got the degree of Doctor of Medicine. He continued upwards of a year longer in Germany, and visited various medical schools, returning to England in February 1797. At that time, the membership of the College of Physicians was restricted to graduates of Oxford and Cambridge; and to qualify himself for it, Y., on his return, entered as a fellow-commoner at Emmanuel College, Cambridge, at which he remained until he took his degree in 1799. In the year 1800, having become a member of the College of Physicians, he took up his residence in London, and began to practise as a physician. He took the degree of M.B. at Cambridge in 1803, and that of M.D. in 1807. His uncle, Brocklesby, who died in 1797, had left him £10,000, besides his house in London, with his furniture, library, and collection of pictures, so that he was in possession of a moderate competency.

In 1801, he was appointed Professor of Natural Philosophy in the Royal Institution, then newly established, and he began to deliver lectures early in the following year. As a lecturer, he was not popular, his style being too condensed, and the matter of his lectures unsuited to the miscellaneous audiences of the Royal Institution. He published in 1802 a *Syllabus of a Course of Lectures on Natural and Experimental Philosophy*, in which, among other things, he first announced his great discovery of the law of the Interference of Light (see INTERFERENCE), which by itself, as Sir John Herschel has remarked, would have procured him a scientific immortality. It was this discovery which first fairly turned the balance of evidence in favour of the undulatory as against the molecular theory of light (see UNDULATORY THEORY OF LIGHT). It is Y.'s most important contribution to science. He had been elected a Fellow of the Royal Society as soon as he was 21; in 1802, he became its foreign secretary, a post which he retained till the end of his life. He resigned his professorship on his marriage, in 1804, fearing that his filling a chair of science might interfere with his success as a physician. The lectures which he delivered as professor were the foundation of the *Course of Lectures on Natural and Mechanical Philosophy* which he published in 1807—a great work, embodying a complete system of natural and mechanical philosophy, on which he was engaged for nearly five years. A new edition of these Lectures was published in 1845, edited by Professor Kelland of Edinburgh. Y.'s doctrine of Interference was at first unfavourably received by scientific men in England: it was attacked and ridiculed in the *Edinburgh Review*; and so little interest was taken in the subject, that of a pamphlet which Y. published in answer to the *Edinburgh Review*, only a single copy was sold. As has often happened, the first recognition of the importance and ingenuity of this and others of Y.'s speculations came from the scientific men of the continent.

Y. was admitted a Fellow of the College of Physicians in 1808, and was elected one of the physicians of St George's Hospital in 1810. He afterwards published several medical works, which, though

they were little more than compilations, and are now forgotten, shew that he was thoroughly versed in the history of diseases and of medical opinion. His hospital practice, too, is said to have been successful; but he had but little success in getting patients. He retired from practice—retaining, however, his connection with St George's Hospital—in 1818, on his appointment to be Secretary of the Board of Longitude. On the dissolution of the Board of Longitude, he became the sole conductor of the *Nautical Almanac*; and afterwards, when the system of life insurance began to be popular, he held, along with this post, the office of scientific adviser of a life insurance company. During the last years of his life, he was a member of a council appointed to advise the Admiralty in scientific matters.

Y.'s greatest achievement, after his great discovery of the law of Interference, was made in connection with the subject of Hieroglyphics (q. v.). He was the first to hit upon the process of investigation by means of which the received interpretation of hieroglyphics has been arrived at. His discovery, originally published in papers written for the Society of Literature, and afterwards in the *Encyclopædia Britannica*, was given to the world in a book in 1823. In his later years, much of his attention was given to this and cognate subjects. He was engaged on an Egyptian Dictionary at the time of his death. His miscellaneous writings, contributions to the Transactions of learned and scientific bodies, to Reviews, and to the *Encyclopædia Britannica*, were very numerous. Three volumes of them, two consisting of Scientific Papers, edited by Dean Peacock, the third of Hieroglyphical Essays and Correspondence, edited by John Leitch, were published in 1855.

He died, after several months of failing health, and a short period of severe illness, on the 10th May 1829. His character seems to have been singularly amiable, and to have endeared him to a multitude of friends, by one of whom, Dr Peacock, Dean of Ely, an ample biography of him was published in 1855. Y. was, two years before his death, elected a foreign Associate of the Academy of Sciences at Paris, succeeding to the illustrious Volta.

YPRES, or YPEREN, a fortified and well-built town of Belgium, in the province of West Flanders, is situated in a fertile plain on both sides of the Yperlee, about 29 miles south-south-west of Bruges (53 by railway). The marshes around the town at one time rendered it very unhealthy, but considerable improvement has been effected in this respect by drainage. Y. was at one time one of the most important manufacturing towns in Flanders, the number of inhabitants in the 14th c. being 200,000, and the number of looms 4000. Its staple manufacture consisted of the cloth called, according to some, after the name of the town, Diaper. The only remnant of its once flourishing manufacture is the Cloth-hall (*Les Halles*), standing in the great market-place, a building of prodigious size, in the form of a trapezium, in a rich style of Gothic architecture, and surmounted by a stately square tower or belfry, with a clock and chimes. It was begun in 1230, and continued till 1342; the east end, supported on pillars, being added in 1730. One of the wings is now used as the *hôtel-de-ville*, and other parts are occupied by different public establishments and concert-rooms. The cathedral of St Martin is a fine Gothic edifice, with an altar of Carrara marble, a richly carved pulpit, and a picture doubtfully attributed to Van Eyck. Other buildings are the churches of St Peter, St James, and St Nicolas, the old castle-ward, two colleges, several hospitals, barracks, numerous boarding and day

schools, &c. The chief modern manufactures are thread, lace, linens, woollens, cottons, silk, ribbons, leather, oil, soap, tobacco. There are many tanneries, oil-mills, salt-works, dye-works, breweries. The town is connected with the Yser by canal, and is a station on the West Flanders Railway. Pop. (1862) 17,390.

Y. is a very old town, its origin dating from the 9th and 10th centuries. In 1688, it was strongly fortified by Louis XIV., and in the great European wars was frequently subject to sieges.

YPSILANTI, a Fanariot family, which falsely pretends to be descended from the imperial stock of the Comneni, has furnished various champions of the Christian population under Turkish rule. The first of these, PRINCE CONSTANTINE Y., was born in 1760 at Constantinople, and for his translation of the works of Vauban, was raised to high official rank by Sultan Selim III., and was subsequently appointed hospodar of Moldavia in 1799, and of Walachia in 1802. His administration of the government of these provinces was marked by wisdom and energy; but his ill-concealed sympathies with Russia led (1806) to his dismissal and flight to Transylvania. Re-established in the government of Walachia by the Russians, he shewed his hatred for the Porte by inciting (1807) the Servians to insurrection; but finding soon after that his allies, the Russians, had views and aims quite inconsistent with his, and unable to strive with both Russians and Turks, he took the oath of allegiance to the czar, and retired to Kiev, where he died 28th July 1816. He has left numerous works, composed in Italian, French, and Turkish.

His three sons, Alexander, Demetrius, and Nicolas, followed up the same course of policy. The eldest, ALEXANDER, born in 1783, served for some time in the Russian army, and was chosen by the 'Hetairists' as their chief in 1820. In promotion of the cause of Rouman independence, he collected a large sum by subscription in Russia, and afterwards invading Moldavia, succeeded in raising an insurrection in both principalities. But, little suited by natural gifts to guide the movement he had originated, he was attacked by the Turks near Galatz, totally defeated, and forced to take refuge in Austria, where he was arrested and imprisoned. Released after a time, but broken in spirit by chagrin and privations, he retired to Vienna, where he died 31st January 1828.—His younger brother, DEMETRIUS, who was born 25th December 1793, also commenced his career in the Russian army, and joined his brother in his schemes for emancipating from servitude the Christian population of Turkey. Sent to Greece, armed with powers from his brother, he took a glorious part in the capture of Tripolitza (October 1820), but was less successful in the following year in his attack on Eubœa. His gallant defence of Argos against the Turks, stopped the victorious march of the latter, and gained (1823) for him the honorary titles of President of Argos, Prince of the Peloponnesus, President of the Legislative Council, and Senator. His stubborn resistance (1825) to the victorious Ibrahim at Napoli was another valuable service to Greece. In 1827, the grateful Hellenes made him commander-in-chief of their forces; but some difference arising between him and the President, Capo d'Istria, he resigned his post in January 1830. He died at Napoli di Romania, 16th August 1832. Y. was insignificant in appearance, but had the soul of a hero; and was as deaf to the allurements of pleasure as to the promptings of ambition.

Y'SSEL or IJSSEL, a river of the Netherlands, formed by the junction at Doesburg, in Gueldres, of

the Oude (*Old*) Yssel from Westphalia and the New Yssel, an offset of the Rhine, cut by Drusus. After this it flows north and latterly north-west past Zutphen and Deventer, forming part of the boundary between Gueldres and Oberyssel, and, passing Kampen, falls into the Zuider Zee, after a course of about 80 miles, forming at its mouth a delta, which is gradually increasing. The principal affluents are the Borcket, the Schipbeek, and the Griff.—There is another river of the same name, a branch of the Rhine, in the province of Utrecht.

Y'STAD, a seaport town in the extreme south of Sweden, on the Baltic, in the laen of Malmöhus, and about 30 miles south-east of Malmö. The town is well built, and has a handsome market-place, two churches, a town-house, barracks, &c. There is a good harbour, and a brisk and improving trade is carried on, steamers plying to Stockholm, Lübeck, Kalmar, Stettin, Stralsund, and Copenhagen putting in here. It has manufactures of tobacco and snuff, chicory, soap, woollen cloths, and leather; there is also some shipbuilding. Pop. about 6000.

Y'TTRIUM is a very rare metal, whose oxide is the earth *Yttria*, which is found in the Scandinavian mineral *Gadolinite* (a silicate of yttria, glucina, and an oxide of cerium and iron), in *Ytrotantalite*, and in one or two other very scarce minerals. Neither the metal, the oxide, nor the salts of the oxide are of any practical importance. According to Mosander, three bases have been confounded under the single name of yttria; to the most abundant of these he gives the name *yttria*, while he distinguishes the others as *erbia* and *terbia*.

YUCATAN. See MEXICO.

YU'CCA, a genus of plants of the natural order *Liliaceæ*, natives of North and South America, and some of which are often cultivated in gardens on account of the singularity and splendour of their appearance. *Y. gloriosa* is a native of Virginia and of more southern parts of North America, but quite hardy in England. It has a stem about two or three feet high, the upper part of which produces a great tuft or crown of large sword-shaped evergreen leaves, each terminating in a sharp black spine. From the centre of this crown of leaves arises the flower-stalk, of three feet or upwards in height, branching out on every side so as to form a great panicle. The flowers are bell-shaped and drooping, white with a purple stripe on the outside of each segment of the perianth. The fibres of the leaves are used by the American Indians to make a sort of cloth and cordage.—The other species have a general resemblance to this in habit and appearance. The fibre of the *Yuccas* is similar to that of the *Agaves* and *Bromëias*, and probably is often included under the name *Pita Flax* or *Pita Fibre*.

Yucca gloriosa.

YUDHISHT'HIRA. See PAND'AVAS.

YUGA (from the Sanscrit *yuj*, join; kindred to the Lat. *jung*, the Gr. *zeug*, Gothic, *juk*; hence, literally, junction) denotes, in Hindu mythology and astronomy, a long mundane period of years, which is preceded by a period called *Sandhyā*, 'twilight,' and followed by a similar period called *Sandhyāṃśa*, 'portion of twilight.' Manu, the Mahābhārata, and the Purāṇas name four such periods, three of which have already elapsed—viz., the *Kṛitā*, *Tretā*, and *Dvāpara-Yuga*; while the fourth, or *Kali-Yuga*, is that in which we live. The *Kṛitā-Yuga*, according to these works, consists of 4000 divine years, its *Sandhyā* of 400, and its *Sandhyāṃśa* likewise of 400 divine years. The *Tretā-Yuga* consists of 3000, and its *Sandhyā* and *Sandhyāṃśa* of 300 divine years each; the *Dvāpara-Yuga* of 2000 divine years, with 200 such years to its *Sandhyā*, and 200 to its *Sandhyāṃśa*; and the *Kali-Yuga* of 1000 divine years, with 100 such years to its *Sandhyā*, and 100 to its *Sandhyāṃśa*. And since a divine year comprises 360 solar years of mortals, a year of men being a day of the gods, these Yugas, with their *Sandhyās* and *Sandhyāṃśas*, would severally represent 1,728,000, 1,296,000, 864,000, and 432,000, or in the aggregate, 4,320,000 solar years of mortals—a period called *Mahāyuga*, or 'a great Yuga;' 4,320,000,000 years being a day and night of Brahmā. See *KALPA*. The notion on which the theory of these Yugas and their *Sandhyās* and *Sandhyāṃśas* is based, as may be easily inferred from the foregoing statement, is that of a descending progression, 4, 3, 2, 1, each of these units multiplied by 1000, and in the case of the periods preceding and following the Yuga, by 100 years. The deteriorating process thus indicated in the succession of these Yugas, is also supposed to characterise the relative physical and moral worth of these mundane ages. 'In the *Kṛitā-Yuga*,' Manu says, 'men are free from disease, attain all the objects of their desires, and live 400 years; but in the *Tretā* and the succeeding Yugas, their life is lessened gradually by one quarter.' . . . 'In the *Kṛitā-Yuga*, devotion is declared to be the highest object of men; in the *Tretā*, spiritual knowledge; in the *Dvāpara*, sacrifice; in the *Kali*, liberality alone.' See also for other passages the article *KALIYUGA*. The present or *Kaliyuga* of the world commenced in the year 3101 B.C., when in the year 1867, therefore, 4968 years of the *Kaliyuga* would have expired.—The term Yuga is sometimes also applied to other divisions of time. The *Vishṇu-Purāṇa*, for instance, mentions, besides the Yugas above named, a Yuga which consists of a cycle of five years, called *Samvatsara*, *Parivatsara*, *Idvatsara*, *Anuvatsara*, and *Vatsara* (see Wilson's translation of this Purāṇa, 2d ed., by Fitzedward Hall, vol. i. p. 49, ff.; vol. ii. p. 254, ff.); and a Yuga, or cycle of five years, is, as Colebrooke states (*Miscellaneous Essays*, vol. i. p. 106, ff.), likewise the cycle described in the astronomical treatises connected with the Vedas. The use of the term Yuga, however, in such a special sense is not frequent, whereas its application to the four mundane ages is that which generally prevails in the classical and medieval Sanscrit literature.—For other works, besides those already referred to, which afford information on these and other divisions of Hindu time, see *Kala Sankalita*, a *Collection of Memoirs on the various Modes according to which the Nations of the Southern Parts of India divide Time*, &c., by

John Warren (Madras, 1825); and *Carnatic Chronology, the Hindu and Mohammedan Methods of reckoning Time explained*, &c., by Charles Philip Brown (Lond. 1863).

YULE, the old name (still in provincial popular use) for Christmas. It points to heathen times, and to the annual festival held by the northern nations at the winter solstice as a part of their system of sun or nature worship. In the Edda, the sun is styled *fagrahvel* (fair or shining wheel); and a remnant of his worship, under the image of a fire-wheel, survived in Europe as late at least as 1823. The inhabitants of the village of Konz, on the Moselle, were in the habit, on St John's Eve, of taking a great wheel wrapped in straw to the top of a neighbouring eminence, and making it roll down the hill, flaming all the way: if it reached the Moselle before being extinct, a good vintage was anticipated. A similar usage existed at Trier (see Grimm, *Deutsche Mythologie*, p. 586). The old Norse *hvel*, A.-S. *hweol*, have developed into Icel. *hioi*, Swed. and Dan. *hjul*, Eng. *wheel*; but from the same root would seem to have sprung old Norse *jol*, Swed. and Dan. *jul*, A.-S. *geol*, Eng. *Yule*,* applied as the name of the winter solstice, either in reference to the conception of the sun himself as a wheel, or, more probably, to his wheeling or turning back at that time in his path in the heavens. Goth. *hveila*, Eng. *while*, denote time as wheeling or revolving. The general nature of the festival, and the way in which the observances were overlaid, or transformed and masked by the Christian institution, are noticed under the head of CHRISTMAS. In the greenery with which we still deck our houses and temples of worship, and in the Christmas trees laden with gifts, we perhaps see a relic of the symbols by which our heathen forefathers signified their faith in the power of the returning sun to clothe the earth again with green, and hang new fruit on the trees; and the furnety still or lately eaten on Christmas eve or morning in many parts of England (in Scotland, the preparation of oatmeal called *sowans*, is used), seems to be a lingering memory of the offerings paid to Hulda or Berchta (q. v.), the divine mother, the northern Ceres, or personification of fruitfulness, to whom they looked for new stores of grain. The burning of the *Yule-log* (or *Yule-clog*) testifies to the use of fire in the worship of the sun (see BELZEN).

YVETOT, an old town of France, in the dep. of Seine-Inférieure, is situated on an elevated and fertile plain, 32 miles north-east from Havre, and 23 north-west from Rouen by railway. The houses are mostly of wood, roofed with slates, the principal street being upwards of two miles long; there is a well-planted promenade, but the town contains few objects of interest. There are manufactures of linen, cotton, calico, and velvet, and a considerable trade in cattle and agricultural produce. Pop. (1866) 8092. The Lord of Y. is styled 'Roi d'Yvetot' in old chronicles, and antiquaries have been much puzzled to account for the origin of the title. There is a tradition that Clotaire, son of Clovis, having slain one Gauthier, Lord of Y., before the high altar of Soissons, endeavoured to make atonement for the sacrilegious deed by conferring the title of king on the heirs of Gauthier.

* In one of the Frisian dialects, *jule* or *jole* is used to signify a wheel.

Z

THE last letter of the English and other West European alphabets, had no place in the original Latin alphabet, but was adopted in the time of Cicero from the Greek along with *y* (*v*), and thus stood last. In Greek, it had the sixth place, and had the power of a double consonant, being equivalent to *ds* or *sd*; in Latin, its use was confined to words of Greek origin. In High-Ger., in which it is pronounced like *ts*, it corresponds to *t* in the Low-Germanic and the Scandinavian tongues, e. g., *zeit* = Eng. *tide* (time). In Ital., *z* or *zz* mostly takes the place of the Lat. *ti*, as in *negozio* = *negotium*, *palazzo* = *palatium*, and is pronounced *ts*, or, preceded by *n*, *ds*. In Eng. and in Fr., it represents the flat sibilant sound of which *s* is the sharp. But in Eng., as in the vast majority of cases *s* has always been employed to represent the flat sibilant sound as well as the sharp (e. g., in almost all plurals, as *bones*, *cards*, in words like *revise*, &c.), there is a tendency to drop the use of *z*, except in a few individual words, such as *size*, *prize*. Many maintain the use of *z* in words derived from the Greek, especially from verbs in *izo*, as *baptize*, and also in words formed on the analogy of these, as *legalize*; but even the advocates of this rule do not act on it consistently, and the mere English scholar is fairly puzzled. This is one of the points of English orthography most urgently calling for reform.

ZAANDA'M, or SAARDAM, an important town in North Holland, is situated on both banks of the river Zaan, at its entrance into the Y, a deep and narrow bay of the Zuider Zee, 5 miles north-west of Amsterdam on the other side of the bay. In former times, ship-building was carried on very extensively at Z., but has now nearly ceased. The whale-fishing, which, in 1701, employed 35 ships, has been altogether abandoned. There is still a considerable shipping-trade. The principal industries are sawing wood, preparing vegetable oil—chiefly from colza—manufacturing paper, grinding grain, mustard, dye-stuffs, snuff, &c., making starch, rope-spinning, and iron-founding. At a distance, the town looks like a forest of windmills.

Z. is a pleasant place, and many of the inhabitants are reputed to be wealthy. In 1697, Peter the Great worked in one of the ship-building yards as a carpenter, and the house in which he lived is carefully preserved. It was visited in 1814 by the Emperor Alexander of Russia, and is now surrounded with another building, to prevent exposure to the weather.

There are two Dutch Reformed churches, one Lutheran, two Baptist, and two Roman Catholic churches, a Jewish synagogue, and several institutions for orphans and old people. Two public schools, a school of design, and two poor schools are maintained by the town. Pop. (1866) 12,320.

ZABERN (the Roman *taberna*, tavern) is the name of three towns on the west side of the Upper Rhine, two of them German, and the other French.

The first two are in the Palatinate (Rhenish Bavaria)—viz., Berg-Zabern, a town of about 3000 inhabitants, on the Erlenbach, occupied chiefly with agriculture and some small manufactures; and Rhein-Zabern, about four miles further east, on the same stream, with little more than 2000 inhabitants, noted for the two battles fought there and at the village of Jokgrin, about two miles further south, between the Austrians and the French, 29th June and 20th August 1793.

The other, which, to distinguish it from these, is called Alsace-Zabern, once likewise a German town, now belongs to France. In French, it is called SAVERNE, and is the chief town of an arrondissement in the dep. of Bas-Rhin. It is situated on the Zorn, which flows into the Rhine, and on the Paris and Strasbourg Railway and highway, and also on the Marne and Rhine Canal, and possesses a palace and college and 5100 inhabitants, who are employed in making cloth, pottery, leather, and hardware, and in the transport of wood from the Vosges Mountains. It belonged in the 12th c. to the bishops of Metz, and afterwards to those of Strasbourg. There are still some Roman antiquities in the college. In 1696, the fortifications were razed. The stately palace was rebuilt by Cardinal Louis de Rohan, famous in the story of the Diamond Necklace (q. v.); it served in 1817 and 1818 as barracks for the Austrian army of occupation; of late, it has been converted into an institution for the widows and daughters of the members of the Legion of Honour. The surrounding scenery is rich in ruins and picturesque effects. A spiral walk, called the Zabern Path, about nine miles long, leads, with many windings and 17 covered bridges, to the top of the Vosges, from which the spectator looks down on Alsace as a garden. The Pass of Zabern, or Saverne, which divides the Upper and Lower Vosges, is only 1325 feet high. The railway, the canal, the Zorn, and highway, all run side by side along the charming valley; and there is a constant succession of bridges, embankments, viaducts, and tunnels throughout the 45 minutes' journey from Z. to Saarbourg.

ZA'BISM. In the article on SABEANS (q. v.), we spoke chiefly of certain inhabitants of Arabia Felix, the 'Sabaioi' of the Greeks, or 'Sabei' of the Romans. It appears that this name was, in the 4th c. A. D., superseded by that of Himyarites, and belonged to many tribes, that derived their descent from one Sabá ('a descendant of Eber, or descendant of Noah'), who also was called Abd Shemesh—Servant of the Sun. These Sabeans, who considered themselves pure autochthons, in contradistinction to the immigrated tribes, have often been confounded with a number of other peoples of antiquity, and with professors of many forms of religious belief and speculation; in fact, the confusion that has sprung out of the unwieldy mass of information found respecting these many varieties, and which has been hopelessly mixed up by many generations of orientalists and theologians, is almost without parallel. We shall not here survey the manifold systems and theories that have been evolved from

time to time, and handed down carefully, but we shall rather—in the main following Dr Chwolson—enumerate the principal stages of Z. as it appears, considered as a religious phase of mankind. We must premise that we exclude at once those imaginary Zabians who were taken by the medieval Arabic, Jewish, and Persian writers to be identical with heathen or star worshippers, as well as those who, like the ancient Chaldeans, the ante-Zoroastrian Persians, the Buddhists, &c., were vaguely called by that name by Mohammedan and other writers of the 12th c. These writers all start from the notion that idolatry, star-worship, and Sabæism were identical, and they called nearly all those who were neither Jews or Christians, nor Mohammedans or Magians, heathens or Sabæans. Z. had then become, like Hellenism, from being a *nomen gentile*, an appellative. Confining ourselves to historical Z., we have to distinguish (1) the Chaldean Zabians of the Koran. These are the 'Parsified' Chaldean heathens or non-Christian Gnostics—the ancestors of the present Mandaites, or so-called Joannes Christians, who live not far from the Persian Gulf, and speak a corrupt kind of Chaldeo-Aramaic; and (2) the Pseudo-Zabians, or Syrian Zabians (in Harran, Edessa, Rakkah, Bagdad), or, since 830—831 A. D., remnants of the ancient Syrian but Hellenised heathens. These disappear (as Zabians) since the 12th c., but perhaps still exist, under some other name, in Mesopotamia. It is those Pseudo-Zabians who spoke the most refined Syro-Aramaean dialect. They form the chief representatives of Z. emphatically deserving of the name. The first named, or Chaldean (Babylonian) Zabians, who transferred that name to the Harranic Zabians, and were of great influence upon the development of these latter's peculiar speculations, are the people meant under that designation by the Koran, and by the Mohammedans of this day. They are, as we said, also known as Christians of St John, or Mendaites. Among the Nabathean heathens of the north-east of Arabia and the extreme south of Mesopotamia, near Wasith and Bassra, there arose, in the last decennium of the 1st c. A. D. a man named Elxai (Elchassai = Scythianus), born in the north-east of Parthis (probably an adherent of Zoroastrianism, perhaps also acquainted with Buddhism), and spread among them Parsee ideas and Parsee religious rites and customs. They called themselves Mendaites—i. e., Gnostics. Many of their religious legends and tales they adopted at a later period from their Jewish and Mohammedan neighbours—chiefly, it is presumed, with a view of making themselves less hated by the ruling Mohammedan powers. They received the name of Seabin from their constant washings, and purifications and baptisms. Their Arabic neighbours occasionally translated this word into the Arabic Al-Mogtasilah, 'those who wash themselves.' About a hundred years after the foundation of this sect by Elchassai, Manes was born of Mendaites parents, and was brought up among the Mendaites. He remained faithful to this creed up to his 24th year, at which period he founded the new sect of Manicheans (q. v.), which did not at first depart so considerably from Mendaitism as it did at a later period (see MANICHEANS). To these aboriginal Zabians there succeeded, in 830 A. D., a totally different kind of sect under the same name—viz., the Harranian Syrians. They themselves derived their denomination from one Zabl, who is variously called a son of Seth, son of Adam, or a son of Enoch or Idris, or a son of Methuselah, or of some fictitious Badi or Mari, a supposed companion of Abraham; while the Mohammedan writers, who, like the Greeks, endeavour to derive everything from their native tongue, either declare it to be

derived from *saaba*, 'to turn, to move,' because they turned to the paths of untruth, instead of that of the true religion—i. e., Islam; or, as the Zabians themselves sometimes explain it, 'because they have turned to the proper faith.' Another Arabic derivation makes them take their name, still more absurdly, from a root *saaba* = to fall away from the proper religion, or to turn one's head heavenwards—i. e., for the purpose of worshipping the angels and the stars, &c. European scholars have for the most part followed either Brooke or Scaliger, who variously hold the name to have sprung either from an Arabic root, which would point to their having come from the 'east,' or, again, from the Hebrew word for 'Host,' viz., of heaven, which they were supposed to worship. The real state of the case, however, is that, whatever the derivation of the name, it did not originally belong to the Harranians, as we have stated already, but was assumed by them, for the purpose of evading the Mohammedan persecutions, from the people mentioned in the Koran.

But it is by no means easy to say who these so-disguised Harranians really were, and what, since it was neither Judaism, nor Christianity, nor Mohammedanism, nor Magism, their religion really consisted of. Former investigators mostly took them to have been a distinct race and people, and their religion to have been composed of Chaldaism, Paraism, Judaism, Christianity, Neo-Platonism, Gnosticism, and Cabbalistic speculations. This, however, is far from being the fact. Broadly speaking, they might perhaps best be described as Syrians, who, partly descended from Greek colonists, had been subject so long to Syrian influences that they became in a manner Syrianised. Their religion was heathenism, the old heathenism of their Syrian fathers, which had, with incredible obstinacy, resisted not only Christianity, but rendered even Mohammedan ill-will harmless by stratagem. There can, however, be no doubt about certain foreign non-pagan elements having crept into it during the early Christian centuries. Eclecticism prevailed at that period, and it was not only Greeks and Romans that found the influence of foreign, chiefly eastern, metaphysical speculation irresistible. But apart from that peculiar syncretism, we find many other new additions to Harran idolatry in the shape of Zabism. There are, first of all, a certain number of legends about biblical personages from whom they pretend to be descendants—legends which, it may be presumed, they only, for the nonce, permitted to belong to their sacred traditions. There are further a number of laws of purity and impurity, and of sacrifices, which strongly remind of Judaism. Again, names of Greek and Roman gods, such as Helios, Ares, and Kronos, occur, a circumstance that perhaps may be explained from the prevailing tendency of the period of exchanging the names of native divinities for Greek and Roman names. Besides these foreign elements, there are certain metaphysical and physical views incorporated in their creed which are distinctly traceable to Aristotle, and finally, the theurgico-Neo-Platonic religious philosophy of heathenism, such as it is found in Porphyry, Proclus, Iamblichus, and the rest. All these apparently incongruous elements, however, infused into it by the circumstances of the period, do not prevent Z. from being in reality heathenism. Were further proof needed, we should find it in the words of a celebrated Zabian, Thabit ben Korra, quoted by Barhebræus, in the shape of a panegyric on the town of Harran and its heathenism, uttered, as Barhebræus says, in his 'purlblind obstinacy.' After speaking of Christianity—not to its advantage—for some time, Thabit rejoices over the

blessings that still belong to his native place, Harran, through its having kept itself utterly unswayed by that faith. 'We,' he continues (the Zabians or Harranians), 'are the heirs and progenitors of heathenism, which has once been gloriously spread over this globe. Blessed is he who bears his burden for heathenism's sake, with firm hopes. Who has civilised the world and built its cities, but the nobles and the kings of heathenism? Who has constructed the harbours and has made the rivers navigable? Who has taught the hidden science? To whom else has the deity revealed itself, given oracles, and told the things of the future, but to the most celebrated men among the heathen? . . . Heathens have done all these things. They have brought to light the healing of souls; they have taught their salvation; they have also made manifest the art of healing the body; they have filled the world with institutions of government and with wisdom, which is the highest good. Without heathenism, the world would be empty and poverty-stricken, and swallowed up by great misery.'

Without entering into a detailed account of the many sources whence our information is derived with regard to the creed itself, we shall briefly indicate that they are written in Arabic, in Hebrew, and in Greek. The former are the most copious; those in Hebrew are chiefly represented by Maimonides; and the Greek are ascribed to various pseudonymous writers, among whom figure Aristotle and Hermes Trismegistus. From their various, and, to a great extent, contradictory statements, we owe the following indications regarding the principal points of this creed. The Creator, it teaches, is in his essence, primitivity, originality, eternity, One; but in his many manifestations in bodily figures, manifold. He is chiefly personified by the seven leading planets, and by the good, knowing, excellent, earthly bodies. But his unity is not thereby disturbed. It is, the Zabians say, 'as if the seven planets were his seven limbs, and as if our seven limbs were his seven spheres, in which he manifests himself, so that he speaks with our tongue, sees with our eyes, hears with our ears, touches with our hands, comes and goes with our feet, and acts through our members.' Nothing, we are told, is more foreign to Z. than—what holds good of the creed of the Sabseans only—rude star-worship. Z., according to the authority of Sharastani, expresses the idea that God is too great and too sublime to occupy himself directly with the affairs of this world; that he therefore has handed over the ruling of it to the gods, and that he himself only takes the most important things under his special care; that, further, man is too weak to address himself directly to the Highest, that he therefore is obliged to direct prayers and sacrifices to the intermediate deities to whom the rule of this world is intrusted. Thus the veneration shewn to planets, and even the worshipping of idols, is nothing but a symbolical act, the consequence of that original idea. There are many gods and goddesses in Z. of this intermediate stamp. It is not the planets themselves, but the spirits that direct and guide them and deliver them which are taken as deities of this kind—deities that stand to the spheres in the relation of soul to body. Apart from these, there are those gods who cause or represent every action in this world. Every universal natural deed or effect emanates from a universal deity, every partial one from a partial deity that presides over part of nature. Everything that appears in the air, which is formed near the sky or arises from the earth, always is the product of certain gods, that preside over these manifestations, in such a manner that the rain in general, as well as every special

drop of it, has a presiding numen. These spirits also mould and shape everything bodily from one form into the other, and gradually bring all created things to the state of their highest possible perfection, and communicate their powers to all substances, beings, and things. By the movement and guidance of these spiritual beings, the different elements and natural compositions are influenced in such a way that the tenderest plant may pierce the hardest cliff. He who guides this world is called the first spirit. These gods know our most secret thoughts, and all our future is open to them. The female deities seem to have been conceived as the feeling or passive principle. These gods or intelligences emanate directly from God without his will, as rays do from the sun. They are, further, of abstract forms, free of all matter, and neither made of any substance nor material. They consist chiefly of a light in which there is no darkness, which the senses cannot conceive, by reason of its immense clearness, which the understanding cannot comprehend, by reason of its extreme delicacy, and which fancy and imagination cannot fathom. Their nature is free from all animal desires, and they themselves are created for love and harmony, and for friendship and unity. They are not subject to local or temporal changes, and they rule the heavenly bodies, without finding the motion of the most heavy too heavy, or that of the lightest too light. Their existence is full of the highest bliss, through their being near to the Most High, whom day and night they praise, without ever feeling fatigue or lassitude, to whom they are never disobedient, but whose will they always fulfil with supreme delight. They have a free choice, and always incline to the good. 'These spiritual beings, our lords and gods, are our intermediators and advocates with the Lord of lords and God of gods.' All substances and types of the bodily world emanate from the spiritual world, which is the one from which everything flows, and to which everything returns, and which is full of light, sublime and pure. These two worlds correspond to each other, and are to each other like light and shadow. The way to approach these gods, and, through them, the highest essence, is by purifying our souls from all passions, by keeping a strict guard over our words and deeds, by fasting, heartfelt prayer, invocations, sacrifices, fumigations, and incantations. By steadfastly persevering in these and similar acts of devotion, man may reach so high a step of perfection that he may communicate even directly with the Supreme Power. The planets, as the principal representative and intermediate gods, are to be carefully observed, especially as regards—1, the houses and stations of the planets; 2, their rising and setting; 3, their respective conjunctions and oppositions; 4, the knowledge of the special times and seasons, the hours and days of the ruling of special planets; 5, the division of the different figures, forms, climates, and countries, according to their dominant stars—the prevailing notion of the Zabians being, like that of the Chaldees and the sect of the so-called Mathematicians (according to Sextus Empiricus), as well as of the Neo-Platonists in general, that everything below heaven was subject, in a manner, to the influence of stars, or the spirits that inhabit and rule them. Every substance and every action, every country and every hour, has its special planetary deity. It is therefore well to study carefully the special conjunctions and figures, as well as the special mixtures of incense, which might cause the individual numen to be propitious. Thus, a *g.*, according to the Zabian belief, the first hour of Saturday stands under Saturnus, and it is therefore right and advisable to select at that time such

prayers, seals, amulets, dressee, and fumigations as might be supposed to be particularly pleasing to that planetary god.

In order to address themselves to *visible* mediators, some of the Zabians are supposed to have directed their devotions to the stars themselves. But they soon found how futile a worship it was that addressed itself to things that appeared and disappeared in turn. They therefore manufactured permanent representatives of them in the shape of idols—idols wrought in as complete accordance as possible with the theurgical rules derived from the nature of the deity to be represented. They were of gold, to represent the sun; of silver, to indicate the moon. The very temples in which they were placed were of as many corners as were supposed to correspond to the form of certain stars.

We know but little with regard to the cosmogonical notions of the Zabians. Sharastani, one of our principal authorities, only quotes 'Agathodæmon' as his authority for their assuming five primeval principles, viz.: the Creator, Reason, the Soul, Space, the Vacuum. Out of these, all things are composed. According to another source (Kathibi), however, the Zabians assumed two living and active principles—viz., God and the Soul; further, a passive one, Matter; finally, two which are neither living nor passive—viz., Time and Space. Matter seems to have been held by them to be primeval and everlasting, and to it alone the existence of evil is attributable. God created the spheres only, and the heavenly bodies therein. It is these spheres (fathers) which carry the types or ideas to the elementary substances (mothers), and out of the combination, conjunction, and motion of these spheres and elements, the varying earthly things (children) are produced. Matter is, as we said, because of its defective nature, the source of evil, of ignorance, of folly; whilst the form is the source and fountainhead of the good, the right, the knowledge, and the understanding. Z. further assumes a renewal of this world after each great 'world-year'—a space of 36,425 ordinary years. At the end of these periods, the plants, the animals, and the men that had existed within it, cease to propagate themselves, and a generation of each of them, different from all previous ones, springs into life. How far this theory is identical with the Babylonian, Egyptian, and Indian theories on the same subject, we cannot here investigate; suffice it to call attention to the striking likeness apparent in them all.

Man, the Zabians teach, is composed of contradictory elements, which make him the vacillating, struggling creature he is. Passions and desires rule him, and lower him to the level of brute creation, and he would utterly lose himself, were it not for such religious rites as purifications, sacrifices, and other means of grace, by which he may be enabled to approach the great gods once more, and to attempt to become like unto them. There are different kinds of souls; or rather man's soul partakes partly of the nature of the animal soul and partly of that of the angelic soul. The soul never dies, and punishments and rewards will affect only it, but not everlastingly. But rewards and punishments will not be wrought in any other future world, but in this, only at different epochs of existence. Thus, all our present joys are rewards for good deeds done by us in former epochs; and the sorrows and griefs we endure, spring in the same manner from evil actions we committed at former stages. As to the nature of the general (world-) soul itself, they say that it is primitive, for if it were not so, it would be material, as every newly-created being partakes of the material nature. Yet a material soul would be an impossibility. 'The soul, which is thus an immaterial

thing,' says Kathibi, 'and exists from eternity, is the involuntary reason of the first types, as God is the first cause of the intelligences. The soul once beheld matter, and loved it. Glowing with the desire of assuming a bodily shape, it would not again separate itself from that matter of which means the world was created. Since that time, the soul forgot itself, its everlasting existence, its original abode, and knew nothing more of what it had known before. But God, who turns all things to the best, united it to matter, which it loved, and out of this union the heavens, the elements, and other composite things arose. In order that the soul might not wholly perish within matter, he endowed it with intelligence, whereby it conceived its high origin, the spiritual world, and itself. It further conceived through it that it was but a stranger in this world, that it was subject to many sufferings in it, and that even the joys of this world are but the sources of new sufferings. As soon as the soul had perceived all this, it began to yearn again for its spiritual home, as a man who is away from his birthplace pines for his homestead. It then also learned that, in order to return to its primitive state, it had to free itself from the fetters of sensuous desires, and from all materialistic tendencies. Free from them all, it would regain its heavenly sphere again, and enjoy the bliss of the spiritual world.'

From all this, it will be seen, as we stated at the outset—that the Zabians, about whom so much has been theorised and fabled, were simply heathens who had to a certain extent adopted and modified Neo-Platonic ideas, such as floated in the mental atmosphere of the early Christian centuries. It would be needless to enter into a discussion about the semi-fabulous personages to whom they ascribe the foundation of their creed, such as Agathodæmon, Arani, Hermes, and the rest; or some of those mentioned by other writers, such as Zerdusht, Nawassib, Orpheus, and the rest.

The life of this sect was but short. After having first been on terms of great friendship with the ruling powers of Mohammedanism as well as with Christians and Jews, and having filled many of the highest and most responsible posts at the courts of the kalifs, they were by degrees made the butt of fanaticism and rapacity. Mulcted, persecuted, banished at different periods, they disappear from history since the middle of the 11th century. Some obscure remnants of them seem to have survived in remote corners of Mesopotamia, but they, too, no longer adhere to the original creed, but are mixed up with the Mendaites, mentioned above, and the Shemajeh, or sun-worshippers. Thus obscurely ended a sect which, for 200 years, had produced a host of men pre-eminent in every branch of learning and literature, in philosophy, astronomy, history, natural history, poetry, medicine, and the rest. Many of these men, whose name and fame reached Europe, were confounded with their Mohammedan contemporaries, chiefly because they lived in Bagdad, at that time the centre of learning, the seat of the kalifs and the high dignitaries of state. The Mohammedans, however, had so high an appreciation of Zabian learning, that it became proverbial amongst them, and they could explain it only by tracing it to a supernatural source, notably to Hermes (Trismegistus), the father of the Zâbt, mentioned above.

We have in our sketch mainly followed Chwolson, who, aided by profound learning and acumen, has been the first to clear up the nature of Z., this terrible stumbling-block of many generations of investigators.—For detailed information on it and all the many other points connected with it, we

must refer our readers to the large work in which he has embodied the results of his investigations, *Die Saabier und der Saabismus* (2 vols. St Petersburg, 1856). See also NEO-PLATONISTS, Gnostics.

ZACATECAS, capital of the Mexican state of that name, is situated in the windings of a deep valley or ravine, between high hills, about 320 miles north-west of Mexico. It is built over a vein of silver, which has been deeply explored. The streets are narrow and crooked, but it has a fine appearance from a distance, owing to the size and massiveness of its churches, and the elegance of some of its residences. There are also a college, a gunpowder mill, and a mint. Pop. (1866) 16,000.

ZACHARIAS, a Roman pontiff, successor of Gregory III. in 741, who is noticeable as one of the series of Greek prelates by whom the destinies of Rome and Italy were much influenced in the 7th and 8th centuries. The name of Z., moreover, deserves honourable mention in connection with a work of benevolence and charity, which the Roman Church afterwards consecrated by intrusting it to a special religious order—viz. the redemption of captives from the pagan masters by whom they had been held in slavery. During the troubles arising out of the Lombard invasion, Z., by his interposition in more than one instance in favour of the city of Rome with the Lombard kings, contributed to that prestige of the Roman see, which eventually led to its obtaining the leadership of Italy, and in the end the temporal sovereignty of Rome and the adjoining territory. Z. died at Rome on the 14th March 752.

ZADONSK, a town of Russia, in the government of Voronej, 50 miles north of the town of that name, and about 230 south of Moscow, on the left bank of the river Don. Pop. 6897. The trade of the town is not extensive, owing to the close neighbourhood of the commercial towns Eletz and Voronej. The manufactures are insignificant. Z. possesses a renowned cloister.

ZAFARA'N-BO'LI, a town of Asia Minor, in Anatolia, about 190 miles east-north-east of Scutari, at the junction of two small affluents of the Chat-su. It has four handsome mosques, a church, large baths and khans, and extensive suburbs. It has a considerable trade in saffron (whence its name), which is cultivated extensively in the surrounding country. Pop. supposed to be about 15,000.

ZAFFRE, crude oxide of cobalt, made by roasting cobalt ore and reducing it to powder, with the addition of about three parts of the finest white sand used by glass-makers. It is extensively prepared in Saxony, and is often imported into Britain. When fused into a glass, it is intensely blue, and is much used by enamellers and porcelain manufacturers as a blue colour.

ZÄHRINGEN, a small village near Freiburg, in Baden, in the Breisgau, formerly a province of Austria, but annexed to Baden in 1805. It is historically noteworthy for the ruined castle from which the Dukes of Zähringen took their name, the ancestors of the reigning House of Baden (q. v.). The Hapsburgs (q. v.) are traced to the same stock. Guntram or Gunthran the Rich, Count of Breisgau—son of the famous Erchanger, who raised himself to the dignity of Duke of Swabia and was beheaded for treason in 917—is assumed as the founder of the House of Zähringen. The Zährings claim to be descended from his eldest son, Gebhard; the Hapsburgs, from the younger, Langelin. After the death of Duke Berthold L., 1077, the House was divided into two lines—the ducal or Zähring line, which became extinct in the male line in 1218, with Berthold V., the founder of Bern; and the markgraf

or Baden line, from which the present House of Baden is descended. The ducal Zährings exercised a beneficent sway over a great part of Switzerland.

ZAIRE. See Congo.

ZAMA, a city and fortress in Numidia, about 300 miles south-west of Carthage, near which Hannibal was defeated by the Younger Scipio, 201 B.C. The flower of Hannibal's forces consisted of a small veteran army, that had shared his fortunes for many years; most of the rest were of inferior quality, of many races, variously organised, and of suspicious fidelity. But his greatest deficiency was in cavalry, an arm with which he had repeatedly decided the victory in former battles. In Scipio's army, on the other hand, Numidians, under Masinissa, were present in overwhelming numbers. The onset of Hannibal's elephants, of which he had 80, was defeated and made worse than useless by the wise precautions of Scipio; the cavalry on his flanks were scattered by the furious charge of Masinissa and Lælius; his front line of mercenaries beaten back by the more numerous and better-disciplined Romans. His veteran infantry, hemmed in on all sides, fought with the courage of despair, and were cut to pieces. Hannibal having done everything, both before and during the battle, which could secure the victory, escaped with a few horsemen. Of the Carthaginians, 20,000 were left dead on the field, and an equal number taken prisoners. Of the victors, 2000 fell in the action.

ZAMBEZI RIVER AND REGION. The extensive region in South-east Africa, known to medieval geographers under the general name of the empire of Monomotapa, is shown on old maps as drained by a river called Zambese, or Zambere, on the banks of which appear large towns, of which the mythical 'Vigita Magna' was supposed to be the most famous. The course of the stream, which is the modern Z., is, however, pretty correctly delineated, and even a small lake is shown in connection with it, not far from the real position of Lake N'gami, whose existence we only became aware of a few years ago, and which we now know may be considered one of the most southern collections of inland waters which communicate with the Z. River and the more eastern lakes. The Nyassa or Maravi, as well as the more northern lakes, Victoria Nyanza and Tanganyika (the latter in connection with the Nile basin), are also given with such a degree of accuracy that it plainly shews, that in compiling these early maps, the distinctive features of the region must have been well known—principally, it is supposed, from Arab sources, various settlements of that people inhabiting the east and south-east coast of Africa from the Red Sea to Sofala.

Although the lower region of the Z., for a distance of at least 300 miles from its mouth, has been in possession nominally of the Portuguese since the beginning of the 16th c., forming the captaincies of Rios di Senna, Tete, and Quilimane, yet it is only within the last few years, through the indefatigable exertions of Dr Livingstone (1861—1866, and 1858—1864), Mr Oswald, Dr Kirk, Mr T. Baines, Mr James Chapman, Charles Anderson, and other intrepid African explorers, that we have got anything like an accurate or scientific idea of this vast region, which extends from 8° to 21° of S. lat., and from 14° to 37° of E. long.; and the total length of what may be considered the main stream (called Leambye in its upper course), from its mouth to the point shown on Dr Livingstone's map, where the Leeba River, which proceeds from Lake Dilolo—on the summit of the watershed which divides the rivers running north-west into the Atlantic from those running

ZAMBESI RIVER AND REGION—ZAMIA.

south-east into the Indian Ocean—joins it, cannot be less than 1200 miles.*

The river-basin of the Z. presents some interesting physical features. On the north, it is coterminous, in all probability, with a portion of the Nile river-system; on the south and west, an obscurely marked water-shed, crossing the Kalihari Desert, separates it from the Orange River basin and the rivers that run through Ovampo Land into the Atlantic; on the north-west, its head-waters probably rise close to the tributaries of the great Congo River; while on the south-east, a well-defined mountain-range divides the rivers flowing into the Z. from those which form the Limpopo River, which, it is now nearly certain, enters the sea under the name of the Sabia. It thus forms, as it were, a central link between the waters of the Cape Colony and those of Egypt, connecting, as it were, the regions round the Cape of Storms with those of the Mediterranean.

The name of Z. is preserved from the mouth of the river, or rather a short distance above it, to the junction of the main stream with the Chobe, in lat. 17° 31' S., long. 25° 13' E., which connects it with the sluggish insculcating streams of the N'gami region; from thence it is called Leambye; and its course has been only laid down with any pretension to accuracy as far as its junction with the Leeba (lat. 14° 10' S., long. 23° 35' E.), when it appears to turn suddenly to the north-east, forming a vast network of streams, which anastomose with one another, and appear to form several other connections with the main stream, far to the eastward, through the Rafue, Loangwa, and other branches, at least if native reports can be trusted. Of the more remote sources of the main stream, except Lake Dilolo, we know nothing; but the explorations in which Dr Livingstone (if still alive) is now engaged will probably throw a clear light on this point.

This part of Central South Africa may be considered as an extensive plateau or table-land, from 3000—4000 feet above the sea-level, with an outer fringe or border of basaltic rocks, cutting through which, the Z. River forms one of the most striking scenes in the physical geography of the universe—namely, the Victoria Falls of Livingstone, or Mosi-tunga, or 'Smoke sounds there,' of the natives. Here, a few miles to the east of where the Chobe joins the Z., the latter—a stream of 1000 yards in width—plunges down into a chasm more than 100 feet deep, forming an immense crack in the basaltic rock, at right angles to its course, and is carried along in a narrow channel some 30 miles in the same direction, between steep basaltic rocks, scarce 100 feet apart from each other. The pictorial illustrations of Mr T. Baines will give a far more vivid idea of this wonderful fall than any verbal description.

The whole of this vast country, both north-east and west of the upper course of the river, is very imperfectly known; but it is ascertained that the Okavango of Anderson, formerly supposed to be one of the branches of Cuanene River, is connected with the Z. basin. As we descend the river to the ocean, it runs in a south-east course, varying in width from 500 yards to two miles and more, in the rainy seasons. From the Portuguese town of Tete downwards, it is navigable, although with difficulty in the dry season; and it passes through one or two narrow rocky gorges in the Lupata Mountains, which

* Lake Dilolo appears to have an outlet both to the north and south; and the same thing is reported of another lake to the north, called Kalagwe, whose waters form the Loapula, or east branch of the Zambezi to the south, while to the north they run into the Lake Tanganyika; and if the latter lake, as is supposed, is connected with Baker's Albert N'yanza, a connection with the Nile is thus obtained.

form ugly rapids, except when the river is in full flood. About 80 miles from the mouth, it receives from the north the waters of the Shire, which runs out of Lake Nyassa, the Maravi of old geographers, an extensive sheet of water about 230 miles long, and 50 miles across at its widest part, extending between lat. 11°—14° 30' S., and it enters the low country about 50 miles from the ocean, where it divides into many branches, forming a large delta, of a very unhealthy character. The most northern stream is called the Kwaka, or Kilimane, or Quilimane River; and the most southern and deepest channel, the Luabo. At Kilimane, or Quilimane, about 18 miles from the sea, is the residence of the Portuguese governor of the region; but there are various other entrances used by slavers and contrabandists, which are not very accurately laid down in our charts; and it is both difficult and dangerous to enter the river without a competent pilot.

The Victoria Falls are estimated to be 2500 feet above the sea-level. Tete is considered to be 400 feet; and the rapids of Lake Nyassa, where the Shire issues from it, are 1552 feet above the same; while Lake Shirwa, a smaller lake, south-east of Nyassa, is 2000 feet.

The natives inhabiting the coast region drained by the Z. must be considered of the pure negro type; while the Makololo, who are found in the central and upper country, belong to the Betjuana family, or rather, are a sort of link between it and the negro. They are, however, to be regarded as conquerors of the original tribes, called Makalaka, who may be classed as negroes, and are still numerous. The Zulu tribe of Amatabele, under Mosilakatzé, who inhabit the high region dividing the Limpopo from the Z. basin, have overrun and conquered nearly all the tribes south of them. The slave-trade is actively carried on in the countries nominally claimed by the Portuguese; and the lamentable failure of our late attempts to plant an episcopate and civilise the natives through missionary influence, must be fresh in the memory of our readers. The native population may be considered large, as compared with that of the Cape Colony or Betjuana Country.

All the usual tropical productions are found, but owing to the disturbed state of the native tribes, are but little cultivated. The animal kingdom is very similar to that of the adjacent regions of South Africa; and an immense quantity of ivory is exported both from the west and east coasts. The prevalence of the Taetse (q. v.) makes travelling difficult in the interior. Extensive coal-fields exist, and gold is found in the neighbourhood of Tete and Senna.—Vide the *Travels of Livingstone*, 1st and 2d parts; T. Baines's *Explorations*, Anderson's *Okavango*, and various articles in *Journal of Royal Geographical Society*; and *Transactions of Royal Geographical Society* relative to murder of Dr Livingstone, and expedition sent to ascertain his fate in June 1867.

ZAMIA, a genus of plants of the natural order *Cycadaceae*, of which the species are found in the tropical parts of the world. They have a tree-like stem, with a single terminal bud and pinnate leaves. The wood consists of concentric circles, with very loose cellular zones between them. The male and female flowers are on separate plants, in tessellated catkins, the scales of which differ in form in the male and female plants. The central part of the stem contains much starch, especially in old plants, and a kind of sago or arrowroot is made from some of them. The central part of the stem of the Bread-tree (*Z. cycadis*), of South Africa, which is about six or seven feet high, with a scaly stem, is much used as an article of food by the Kaffirs and Hottentots, who prepare it by wrapping it in a skin well rubbed with grease, burying it in the ground until it

undergoes putrefaction, bruising it between two stones, making it into cakes, and baking it in wood-sashes. There are numerous fossil species of *Zamia*. Closely allied to it is the fossil genus *Zamites*.

ZAMIOSTROBUS, the generic name given to several cones from the Secondary and Tertiary strata, because they were supposed to be the fruits of fossil *zamias*. But Mr Carruthers has shewn (*Journal of Botany*, January 1867) that they belong to true Conifers. He has, however, in the same paper, described six species of fruits belonging to *zamia*-like cycads, to which he has given the generic title of *Cycadeostrobus*. They are all from the Secondary rocks. No cycadean remains whatever have yet been found in newer deposits.

ZAMITES, the generic name under which are included numerous forms of *zamia*-like leaves which occur in Secondary strata. No certain traces of the trunks have yet been found associated with them, and only one species (*Z. gigas*) is accompanied with fruit, and this is so anomalous that it casts considerable doubt on the determination of the affinities of the foliage.

ZAMO'RA, a very ancient town of Spain, capital of the province of that name, is situated 40 miles north of Salamanca, and 132 north-west of Madrid, on the right bank of the Douro, which is here crossed by an old stone bridge. It is the see of a bishop suffragan of Santiago. *Z.* was of great importance in the Moorish times, and is said to have been enclosed by seven lines of walls, with a moat between each. It is entered by seven gates, is surrounded by a wall, has a massive square tower with Norman arches, and many interesting remains of mediæval architecture. *La Magdalena*, a church of the Templars, but afterwards belonging to the order of St Juan of Jerusalem, is a simple solid edifice of the 12th c., slightly modernised. There are 20 other churches, besides a theological school, barracks, a prison, a normal and other schools, a library, museum, &c. It has manufactures of serges, linens, leather, hats, liqueurs, brandy, and a considerable trade in wine and grain. Sir J. Moore urged the Junta of Salamanca to repair the defences of *Z.*, and receive there his stores, but his retreat had commenced before they had done deliberating. Had *Z.* been made tenable, Moore would have fallen back on it, instead of on Corunna. The French afterwards got possession of it, and although no resistance was made, the town was sacked, neither age nor sex was spared, and the principal persons were executed. It was again plundered by the French, and has never recovered these visitations. Pop. 9926.

ZAMOSC, one of the most strongly fortified towns of Russian Poland, in the government of Lublin, 45 miles south-east of Lublin, and 140 south-east of Warsaw, surrounded by water and a marsh. All the houses are built in the Italian style with arcades. There is a large and beautiful castle opposite the former university, town-hall and arsenal, four churches, monasteries, theatre, &c. There are beer and porter breweries. Pop. about 5000.

ZAMOUSE (*Bos brachyceros*), a species of ox or buffalo, found in the tropical parts of Western Africa. It is the *Bush Cow* of Sierra Leone. It differs from the buffalo and all other *Bovides* in several important particulars, especially in the very large size and peculiar fringing of the ears, and in the total want of dewlap. The forehead also is flatter than that of the buffalo. The colour is nearly uniform, a pale chestnut. The hair is thin, and nearly erect. The ears have three rows of long hairs springing from

the inside, and a tuft of long hairs at the tip. There is a considerable space on the forehead between the

Zמוש (*Bos brachyceros*).

horns, which are not long, extend outwards and upwards, are suddenly incurved, and very sharp.

ZANESVILLE, a city of Ohio, U. S., on the left bank of the Muskingum River, and opposite the mouth of Licking River, 54 miles east of Columbus, is a regular well-built town, in a beautiful and fertile valley, with steamboats to the Ohio, and several railways. An iron railway bridge of 538 feet crosses the river, and bridges connect it with its suburbs, Putnam and South and West Zanesville. It has abundant water-power, and rich coal and iron mines; cotton, woollen, nail and glass factories; 5 iron foundries, 15 churches, public and free high schools, 5 or 6 newspapers; &c. Pop. (1860) 9229.

ZANGUEBAR. See ZANZIBAR.

ZAN'TÉ (ancient *Zacynthus*), one of the principal Ionian Islands, about 9 miles from the west coast of the Morea, and 8 south of Cephalonia, is about 24 miles long, 12 broad, and has a superficies of 164 sq. miles. The greater part of the island consists of a plain, stretching from north to south, with a breadth of from 6 to 8 miles, bounded on the west by a line of hills. The vine is extensively cultivated on the plain, and the wine produced is considered to be of a superior quality. The staple product of the island, however, is the currant, which is produced from a dwarf species of vine, originally brought from Corinth. Pomegranates, melons, peaches, and citrons also are grown. *Z.* is said to have been colonised by Achæans from the Peloponnæsus; and it is mentioned in Homer with the epithet 'woody,' which, however, is not apt at the present day, although it is justly called, in an Italian proverb, 'the flower of the Levant.' It is subject to frequent earthquakes, which, it would seem, are likely to recur about once in 20 years. The most notable mineral feature of *Z.* is its pitch-wells, described by Herodotus, which are situated about 12 miles south of the town of *Z.*, in a marshy district. Pop. (1864) 39,367.—**ZANTÉ**, the capital, is the largest town in the Ionian Islands, and is situated at the head of a small bay or harbour on the east coast, on the site of the ancient town, of which the only remains are a few columns and inscriptions. The houses stretch along the semi-circular outline of the bay to the distance of a mile and a half, and extend up the slope of the castle-hill. Most of the streets are narrow, but clean, and the older houses built in the picturesque Venetian style; the huge lattices of wooden framework, resembling those employed in eastern harems, with which the windows used to be fitted, are being rapidly abolished. The principal street is broad

and handsome, the churches are numerous, and the market-place spacious. The harbour of Z. has been greatly improved of late years; it is now protected by a long mole, and has a light-house, but is still somewhat exposed and insecure. A magnificent and extensive view is obtained from the citadel in the highest part of the town. Z. is the see of a Greek protopapas, and of a Roman Catholic bishop. Pop. 20,000.

ZANZIBAR, or ZANGUEBAR. The territories of the Sultan of Z. comprise all that part of the east coast of Africa included between Magdashooa, situated in 2° N., and Cape Delgado in 10° 42' S. lat. They are bounded on the N. by the independent tribes of Somal and Gallas, and on the S. by the Portuguese province of Mozambique. The extent of the coast is about 1100 miles, and parallel to it are numerous islands, the most important of which are Zanzibar, containing the capital of the same name, Pemba, and Máfia (Monfia on the charts). The territories on the mainland have no defined limit towards the interior, being occupied by heathen tribes, over whom the sultan's authority is hardly even nominal beyond the sea-board. The soil along the coast is fertile in rice, millet, peas, beans, melons, pumpkins, the sugar-cane, cocoa-nut, banana, plantain, &c., and the forests supply the caoutchouc tree and many valuable species of timber. Cattle, sheep, and fowls are plentiful, and tropical wild animals abound. Rice, sugar, molasses, ivory, gums, gold, and cowries are exported. The heat on the coast is excessive, and the climate very unfavourable to Europeans. The name Z. is applied to the coast from 4° N. to 12° S.

The island of Z., by far the richest and most important part of the sultan's dominions, is distant from 20 to 30 miles from the African coast; it is about 48 miles in length, and from 15 to 30 in breadth. It contains an area of about 400,000 acres, and the soil is in most parts of exceeding fertility; being covered with woods and plantations, and the frequent rains causing perpetual verdure, it everywhere presents a delightful appearance. It is very flat, the highest point being not more than 300 feet, composed entirely of coral, and abundantly watered by rivulets, which flow at all seasons of the year. The principal products are cocoa-nuts, cloves, rice, sugar-cane, manioc, millet, and fruits in the utmost abundance, especially oranges of the finest quality, which can be purchased at the rate of 1000 for four shillings. The island is intersected by paths and green lanes in every direction, affording a never-ending variety of pleasant walks and rides. The country-houses of the Arab proprietors, and the huts of their slaves, are thickly dotted over the surface, surrounded with gardens and fields. The hedgerows are covered with flowering creepers, and pine-apples grow amongst them in wild profusion. In many parts are glades of undulating grass-land, of park-like appearance, dotted with gigantic mango trees; the ponds are covered with rushes and water-lilies; and the air is perfumed with the blossoms of the orange and clove. The pop. of the island is estimated at about 250,000. The town contains about 60,000 permanent inhabitants; while probably from 30,000 to 40,000 strangers come from Arabia, India, and the northern parts of Africa during the season of the north-east monsoon. The chief people are the Arab landed proprietors, who form a sort of aristocracy, possessing large plantations and numerous slaves; besides these, there are slaves, free blacks, natives of the Comoro Islands and Madagascar, and from 5000 to 6000 natives of India, who keep nearly all the shops in the town, and through whose hands nearly all the foreign trade of the place passes. The language of

the court and of the Arab population is Arabic, while the slaves and the free black population speak a dialect called *Kiswahili*, one of the great family of South African languages.

The climate of Z. is extremely equable and salubrious, the thermometer having probably never risen as high as 90°, nor fallen lower than 70°. Nearly 200 inches of rain fall during the year, of which half at least falls in March, April, and May.

The capital is extensive, but, like most oriental towns, it is narrow, irregular, and ill built; the houses of the principal inhabitants, and of the European residents, are large flat-roofed buildings, generally with an interior courtyard; and some of them, and especially the palace of the sultan, may almost claim to be magnificent.

The trade is very considerable. In 1863, it was as follows: Imports, £544,903; exports, £467,053; total, £1,011,956. The imports consist of cotton goods, brass wire, beads, arms, &c.; and the exports of gum, copal, cloves, ivory, cocoa-nut, oil-seeds, dye-weeds, and a great variety of other articles. No export duty is charged, and only 5 per cent. import duty.

The sultan has a considerable body of rabble soldiery, but nothing approaching to a disciplined standing army. His naval force consists of 1 frigate, 52 guns; 1 frigate, 32 guns; 1 corvette, 22 guns; 1 brig, 4 guns.

The earliest settlement of Arabs on the east coast of Africa occurred about 924 A.D.; and for several centuries, flourishing republics, governed by elders, elected by the citizens, existed along the coast. Vasco da Gama visited Z. in 1499, and in 1503 the dominion of Portugal was recognised by the inhabitants, who agreed to pay an annual tribute; but the Portuguese never held it for very long periods. About 1735 A.D., they were finally expelled, and in 1784, the island was taken by the Imaum of Muscat, in whose family the government remained until the death of the late Imaum, Seyed Saed bin Sultan, in 1854, when the Arabian possessions fell to his son, Seyed Thoweni, and Z. and its dependencies to Seyed Majid, the present sultan, each division becoming an entirely separate and independent kingdom.

ZARA (ancient *Jadera*), the chief town of Dalmatia, on the coast of the Adriatic, 73 miles north-west of Spalatro, and about 128 south-east of Trieste. The town is strongly fortified, and is built in the form of an oval, on a narrow promontory, separated from the mainland by a moat, across which is a drawbridge. The town is entered by two gates, one from the sea, called Porta-Marina, supposed to be partly of Roman construction; and one from the landward side, called Porta-di-Terra-Firma. The ramparts, of Venetian construction, and partly planted, afford a fine promenade to the inhabitants. There is a spacious and well protected harbour, which, however, is somewhat shallow. The streets generally are narrow and ill paved, and the drainage defective; the town is not well supplied with water. Of its churches, the most noteworthy are its cathedral, founded by Henry Dandolo, Doge of Venice, and the church of the patron saint, St Simeon. There are many convents and monasteries; a lyceum, gymnasium, and other schools; a barrack, and a naval and military arsenal; hospitals, a theatre, museum, and other public buildings. There is a lofty marble column, which is all that is left standing of an ancient Roman temple; there are also the remains of a Roman aqueduct. Z. is the seat of the government of Dalmatia, and the see of a Roman Catholic archbishop. The commerce is unimportant. Many of the inhabitants are engaged in fishing and in the

coasting-trade. The chief manufactures are rosoglio, maraschino, leather, silk and linen fabrics. Pop. 8850. Italians by descent, and speaking the Italian language. Anciently, Z was the capital of Liburnia, in Illyricum; and under Augustus it was made a Roman colony.

ZARAGOZA. See SUPPLEMENT.

ZARAI'SK, a Russian town, in the government of Riazan, 32 miles north-west of the town of Riazan, and 80 south-east of Moscow, a few miles from the right bank of the Oka, a tributary of the Volga. The town was founded in the 13th c.; and in 1531, Ivan the Terrible erected on the site of the old fortifications a strong fortress, which thrice resisted the assaults of the Tartars, and which still exists. Another noteworthy object is the Cathedral of St Nicolas, which dates from 1631. There are manufactures of soap and candles, as also several tanneries and breweries; these, however, produce only sufficient to meet the wants of the inhabitants. The commerce of the town has greatly declined since 1847, when the new road of Riazan was opened, leaving Z. out of the way. Pop. 5062.

ZE'A (ancient *Ceos*), an island of the Grecian Archipelago, one of the Cyclades, 13 miles east of Cape Colonna; 14 miles in length, and 8 in greatest breadth. It is somewhat egg-shaped. Its surface rises from the coast in terraces, culminating in the centre in Mount St Elias, whose lat. is 37° 37' N., and long. 24° 21' E. The climate is healthy, and the soil fertile. The products are wine, fruit, barley, cotton, and silk. Attention is paid to the rearing of cattle and silkworms. Pop. 5000. Pliny says that Z. was once united to Euboea, but that four-fifths of it were carried away by the sea. Z. was the birthplace of the lyric poets Simonides and Bacchylides. The island once possessed four towns, but there is now only one, *Zea*, situated on the north-west slope of the hill, about 3 miles from the coast, on the site of the ancient *Zulis*, of which the most important remain is a colossal lion, about 20 feet in length, lying a short distance east of the town. A few remains are also still to be found on the sites of the other three ancient towns. The harbour of Z., Port St Nicholas, about 3 miles from the town, admits the largest vessels, and is well frequented.

ZEA. See MAIZE.

ZEBI'D, a town of Arabia, district of Yemen, on the river Zebid, 15 miles from its mouth, 115 miles south-west of Sanaa, and 60 north of Mocha. The town is of great antiquity, on account of which and of the dark colour of the bricks of which it is built, it has a somewhat gloomy appearance. Z. is strongly fortified, being surrounded by high walls, said to be a league in circuit, flanked with numerous towers. It possesses a large mosque, with an elegant octagonal tower. Z. was formerly a place of much commercial importance, but it has declined into comparative insignificance, owing to the accumulation of sand in the mouth of the river. Pop. 7000.

ZE'BRA, a name sometimes given to all the striped *Equidae*, all of which are natives of South Africa, and thus including the *Daw* (q. v.) and *Quagga* (q. v.); but also, in a more restricted use, designating a single species, *Equus* or *Asinus Zebra*, a native of the mountainous districts of South Africa. In the whole group, the characters more resemble those of the ass than of the horse; the tail is furnished with long hairs only towards the tip, and the hind-legs are without warts; the neck is full and arched, the mane stands erect. The Z. is about 12 hands high at the shoulder. It is of a light and graceful form, with slender limbs and narrow hoofs; the head light, the ears rather long

and open; the ground colour white, or slightly tinged with yellow; the head, neck, body, and legs striped with black, the neck and body transversely, but not regularly; the head with bands in various directions, the legs with irregular cross stripes. The Z. lives in small herds, inhabiting the most secluded spots. Its senses of sight, smell, and hearing are very acute, and the least alarm is sufficient to make a whole herd scamper off, with pricked ears and whisking tails, to inaccessible retreats

Zebra (*Asinus Zebra*).

among the mountains. When attacked, however, and compelled to defend themselves, zebras do it vigorously, the herd forming in a compact body, with their heads towards the centre, and their heels towards the enemy, repelling even the lion and leopard by their kicks. The Z. has been domesticated, and used as a beast of burden, but generally shews a vicious and untractable disposition. The flesh is eaten by the natives and hunters of South Africa. A hybrid has been produced between the Z. and the ass.

ZEBU', one of the Philippine Islands (q. v.).

ZEBU, INDIAN OX, or BRAHMIN OX, a kind of ox, very nearly allied to the common ox, of which naturalists generally regard it as a mere variety, although some think it a distinct species (*Bos Indicus*). The most conspicuous distinctive character is a large fatty hump on the back, above the shoulders. The legs are also rather more slender and delicate than in the European ox. The hump attains a very great size in animals plentifully

Zebu or Indian Ox.

supplied with food, and not compelled to work; in those which are ill fed or hard worked, it is comparatively small. It is alleged that intermixture takes place freely with the common ox, and that there is no difference of anatomical structure, but these statements require verification. Mr Vasey found the number of caudal vertebrae in the Z. to

be only 18, whilst in the common ox it is 21. The period of gestation in the Z. is also said to be 300 days, whilst in the common ox it is 270. The Z. is diffused over India, China, the Asiatic Islands, Madagascar, and the east coast of Africa. There are many breeds, differing very much in size; the largest being larger than any oxen of Europe, whilst the smallest are not much larger than a large mastiff. The hump of the largest breeds is said to be sometimes 50 lbs. in weight. English residents in India esteem the hump as delicious for the table. There are hornless breeds; but most of the breeds have short horns. There is a breed with two fatty humps, one placed immediately behind the other, which is common in the vicinity of Surat. The voice of the Z. resembles the grunting of the yak, almost as nearly as the lowing of the ox. The Z. is used in India both as a beast of draught and of burden. It is yoked in the plough. It is occasionally used for riding. It can travel from 20 to 30 miles a day. It is very gentle and docile.

The Brahminy or sacred bulls of the Hindus, consecrated to Siva, are all of this kind of ox. They are caressed and pampered by the people, and to feed them is deemed a meritorious act of religion. The Brahminy bull may go where he pleases; it is not lawful to beat him, even if he be eating a valuable crop, or if he enter a shop and devour the articles exposed for sale. He soon learns to despise shouting, which is the ordinary expedient to drive him away, and makes himself at home everywhere.

ZECCHINO. See DUCAT.

ZECHARIAH, called in the book of prophecy which goes under his name, 'the son of Berechiah, the son of Iddo,' but in Ezra, 'the son of Iddo,' was born in Babylon during the captivity, and accompanied the first band of exiles on their return to Palestine under Zerubbabel and Joshua. Very little is known of his personal history, but enough to assure us that he was a man of influence and a leader among his countrymen. He combined in himself the offices of priest and prophet. Ezra expressly ascribes to Haggai and him the merit of stirring up, by their prophetic inspiration, the patriotic enthusiasm of the Jews to complete the rebuilding of the Temple. Later traditions, which are probably more or less in the line of historic fact, state that he assisted in providing for the service of the Temple (various of the liturgical psalms being ascribed to him), and that he was a member of the great Synagogue (q. v.).

The prophecies of Z. may be divided into three parts: the first (chapters i.—viii.) consists mainly of a series of visions relating to the building of the Temple, the glory of the city, the removal of all abominations out of the land, &c., and winds up with a prediction that Jerusalem will become, as it were, a centre of religious worship to all the world. The second (chapters ix.—xi.) threatens Damascus and Phœnicia, and the cities of the Philistines with ruin; predicts that Judah will be greater than Javan (Greece), that Israel and Judah will be reunited—though almost immediately he symbolically shows the impossibility of this—and that both Assyria and Egypt will be humbled. The third part sets forth that dark times for Judah are drawing nigh, which shall be as an ordeal for the nation. After sore trial, it shall come forth thoroughly purged from iniquity, and then the Lord will appear in his glory on Mount Olivet, fight victoriously against the hosts of heathendom, and compel all who are not destroyed by his wrath to worship Him at Jerusalem. A millennium of holiness will then begin: 'In that day shall there be upon the bells of the horses, "Holiness unto the Lord" . . . yea, every pot in Jerusalem and

in Judah shall be holiness unto the Lord of hosts' (xiv. 20, 21).

Numerous biblical critics, both in Germany and England, consider the first part only to be the work of Z., and it cannot be denied that the internal evidence strongly favours this supposition. There is a unity, consistency, and sequency in the visionary predictions, and a harmony both of style and matter—the imagery bearing very distinctly the impress of those two master-spirits of the exile, Ezekiel and Daniel—that no candid critic can overlook, while the remaining chapters are totally unconnected in subject with what precede; contain no allusion to the post-exilian age, and speak of idols and false prophets in a way that would be utterly meaningless if applied to the times subsequent to the return from the captivity. The style also is quite different; is softer, richer, more poetical. The spirit of Ezekiel is exchanged for that of Jeremiah or the younger Isaiah. Whether these chapters are the work of one or two authors, has also been elaborately discussed, the evidence being, on the whole, in favour of the latter view.

ZE'CHSTEIN (Ger. mine-stone), a deposit of calcareous rock which covers the Kupfer-schiefer, and which received this name because it must be cut through before reaching the mineral-bearing beds beneath. It is the equivalent in Thuringia of the fossiliferous limestones of Permian age of the north of England.

ZEDEKI'AH, originally MATTAN'AH, the last king of Judah, son of the 'good Josiah' by his wife Hamutal, succeeded his nephew Jehoiachin. The latter having rebelled against his master, Nebuchadnezzar, king of Babylon, was besieged in Jerusalem, and taken prisoner, after a brief reign of three months. Nebuchadnezzar bestowed the vacant throne on Z., doubtless in the expectation of securing a faithful liegeman. If so, he was mistaken. Z. was a weak unwise ruler, probably incapable of political fidelity: in the phraseology of the Jewish historian, 'he did that which was evil in the sight of the Lord.' Forgetting his obligations to the Babylonish monarch, he lent a ready ear to the foolish braggadocio of the nobles and princes of Judah, and in spite of the earnest and reiterated remonstrances and warnings of Jeremiah, finally consummated his perfidy by forming an alliance with Egypt, the hereditary enemy of Assyria and Chaldæa. Swift destruction overtook the traitor. A Babylonish army invaded and ravaged the country, besieged Jerusalem, and after inflicting a crushing defeat on an Egyptian force that was marching to the relief of the city, reduced the inhabitants to such horrible extremities, that they could no longer hold out. Z., accompanied by his wives and children, fled in the darkness of night towards the Jordan, but was overtaken and made prisoner near Jericho. The monarch and his sons were sent to Riblah, at the north end of the valley of Lebanon, where Nebuchadnezzar then abode. The conqueror, with customary Asiatic cruelty, ordered the sons to be slain before their father's face, and then deprived the wretched parent of his eyesight. Thus maimed, and bound with fetters of brass, he was conveyed to Babylon (588 B.C.), where he probably died. The Temple and city were destroyed, the inhabitants carried off into captivity, and the kingdom of David and Solomon ceased to have a place on the earth.

ZEDOARY (Arab. *Jedwar*), the name of certain species of *Curcuma* (see TURMERIC), natives of the East Indies, the root-stocks (*rhizomes*) of which are aromatic, bitter, pungent, and tonic, and are used for similar purposes with ginger. They are

more used in the East than in Europe, but are imported in small quantities, and sold under the name of Zedoary. The ROUND Z. of the shops is the produce of *Curcuma zedoaria*, a native both of India and China, having palmate root-stocks, straw-coloured within. LONG Z. is produced by *C. zerumbet*, a native of various parts of the East Indies, having long palmate root-stocks, yellow within. Z. is a powerful sudorific.

ZEELAND, a province of the Netherlands, consists of the islands Walcheren, North Beveland, South Beveland, Schouwen, Duiveland, Tholen, St Philip's-land, and Staats Flanders. It lies between 51° 20'—51° 45' N. lat., and 3° 21'—4° 15' 54" E. long., and has an area of 665 sq. miles. The boundaries are: South Holland on the N., the Easter Scheldt on the E., Belgium on the S., and the North Sea on the W. January 1, 1866, the pop. amounted to 176,169. The Roman Catholics numbered 44,769; the Jews, 632. There are 180 churches, and 21 different communions. The provincial capital is Middelburg, in Walcheren. Other important towns are Flushing, in the same island; Goes (pron. *Huse*), in South Beveland; and Zierikzee, in Schouwen. The greatest part of the soil, which is a rich clay, has been redeemed from the sea; and almost in the centre of the islands Walcheren, South Beveland, and Schouwen, there are seen still the high mounds of earth called 'hills of refuge,' which the early inhabitants formed as places of safety for themselves and cattle when a high tide burst over the newly acquired lands. The number of Polders (q. v.), or drained districts, in the province amounts to about 400. It is almost entirely arable, and produces the finest crops of wheat, barley, oats, rye, peas, beans, and colza. Potatoes are extensively planted; and in 1865, the madder crop reached 5,761,671 lbs. The stock of horses numbered 23,394; horned cattle, 52,883; sheep, 37,537; pigs, 17,205; and goats, 3871. In many districts of Z., extensive orchards beautify the farms.

The neighbouring seas abound with fish, and in Schouwen, many eggs are collected, myriads of water-fowls resorting thither to form their nests. The principal industries, apart from agriculture, are the preparing of madder for the market, weaving calicos, rope-spinning, ship-building, beer-brewing, soap-boiling, making vinegar, salt, starch, tobacco, tile and brick, tanning leather, grinding corn, sawing wood, &c. The people of Z. are kind and hospitable, and in the country parishes, are much attached to their fairs, meetings for merry-making, and other old customs, which might with advantage be given up. Few marriages take place among the agricultural portion of the population till absolutely necessary, but a case of desertion rarely occurs, as it would utterly disgrace the young man who did so.

On the 15th of October 1866, a fine ship-canal through the island of South Beveland was opened, and is to take the place of the Easter Scheldt, which is to be crossed by a railway in course of construction, from Flushing, through Walcheren and South Beveland, to join the main Belgian lines. In February 1867, the works on the Easter Scheldt were begun.

ZEITHUN, a town and district in the highlands of Cilicia, lying in 37°—38° N. lat., and 34°—35° E. long., inhabited by a community of Armenian Christians, virtually independent of the Turkish government, and forming in fact an Asiatic republic. Z. lies in the upper basin of the Jyhun or Pyramus, where that river crosses the Taurus Mountains in descending from the table-land of Asia Minor to the low plain of Cilicia, which sur-

rounds the north-eastern corner of the Mediterranean Sea. It is surrounded on all sides by inaccessible crags, except on the east, where it is bounded by the deep channel of the Pyramus. The hills are covered with magnificent pines, plane trees, and evergreen oaks. Springs and brooks, never dried up during the summer, irrigate the meadows in all directions; but the soil, although abounding in patches of great fertility, does not produce grain in sufficient quantity to supply the wants of the inhabitants. The mulberry trees are, however, numerous in the orchards, and give constant occupation to the women in feeding silk-worms. The men are chiefly engaged in smelting and manufacturing the iron supplied by the mountains into ploughshares, horse-shoes, nails, &c., which they exchange for corn and other articles at Marash and Kaisariyeh. The language of Z. is a rude dialect of Armenian, in which the only literature consists of popular songs not committed to writing. Education is much neglected among children, who, except when intended for the priesthood, are not sent to school after the age of 10 or 12. The inhabitants, like the kindred race in Armenia, are free from Asiatic vices. They resemble Europeans in their respect for women. Crime is not frequent. No prisons exist, and it is asserted that murder has never been committed in the country for the sake of gain. There may be exaggeration in these statements, but the Zeithunians are certainly open-hearted mountaineers. They have, however, shewn the greatest jealousy of foreigners; and until 1854, when their country was visited by M. Léon Paul, a French Protestant clergyman, we only knew of them from the statements of Armenian priests, and articles in the Armenian newspaper of Constantinople. Even now, our information about them is rather scanty. The government seems to be patriarchal, vested in elders of the people, with some prerogatives in the priesthood. When a grievance is felt, complaint is made to the priests, who meet in council, and refer the complaint to the elders assembled as a senate: they decide on the course to be taken. All offices are conferred by popular election, the executive power being placed in the hands of four princes. There are 20 villages in the district, and the chief town, Z., is said to contain 20,000 inhabitants. The Zeithunians can muster an army of from 7000 to 8000 men to defend the mountains against the Turkish pashas; and they are in alliance with a neighbouring Turcoman chief, also independent of the Turks, who brings 10,000 men into the field. Z. is a relic of the Armenian kingdom of Cilicia, founded in the 11th, and destroyed in the 14th century. Since that period, the native populations have been gradually assimilating to the Turks, a change much favoured by the extreme facility with which the Turkish language is acquired. It was not till after the Crimean War that the massacres in the East called special attention to the existence of Z. and other Christian communities in the East, which had some claim to European sympathy. An attempt by the Turks to settle Circassians near Z., gave Aziz Pasha of Marash an opportunity of attacking the Christians, and the atrocities committed remind one of the worst excesses of Cawpore. The inhabitants defended themselves, however, with the greatest gallantry, twice defeating in the field large Turkish forces; and the struggle was at length terminated by the interference of the French and English governments at Constantinople, and the recall of the pasha. Unfortunately, the Turks were allowed to suppress the Armenian newspaper which acquainted the European public with what is taking place at Z., and we have ceased to receive recent information regarding it. An interesting account of the massacres and the defence of Z. will be found

in the *Revue des deux Mondes* of February 1863. See also *Spectator* of 26th August 1865.

ZEITZ, a walled town of Prussian Saxony, in the government of Merseburg, 23 miles south-west of Leipzig, lies in a pleasant and fruitful district, on a steep slope, on the right bank of the White Elster, over which there is a stone bridge. The town is very old, and has some good old public buildings; a cathedral, and four other churches; a good library, containing 12,000 volumes, besides MSS.; asylums for orphans and lunatics, an old and new castle, &c. The walls are pierced by six gates. There are manufactures of cotton, earthenware, leather, calicoes, hosiery, gloves, &c.; several printfields, breweries, and distilleries. Pop. 11,100. It is a station on the Thuringian Railway.

ZELAYA, a town of Mexico, in the state of Guanajuato, about 120 miles north-north-east of the town of Mexico, on the right bank of the Rio Grande de Santiago, which is here crossed by a handsome bridge. It has a fine cathedral, of mixed architecture, with Corinthian and Ionic columns, and numerous other churches and convents, which are rich in works of art. There are manufactures of cotton and saddlery. Horses and mules are bred to a considerable extent in the vicinity. Pop. 14,000.

ZELKOU'A (*Planera Richardi*), a tree of the natural order *Ulmaceae*, with a straight and erect trunk of 75—80 feet high, one-third of which height is without a branch, a large head, elliptical leaves of 1—3 inches long, and small flowers with bell-shaped perianth, and small roundish dry 2-called fruit, the cells 1-seeded. It is a native of Georgia, the north of Persia, &c., and is sometimes planted in England. The timber is valuable, the sapwood elastic, the heartwood very hard.—*P. Gmelini* is a low tree, a native of Kentucky, and of some of the more southern states of America.

ZEMINDAR, the name given to the governors of districts or large towns in India, under the Mogul rule. Many of the zemindars occupied in India a position almost similar to the dukes and counts of Western Europe in the middle ages; they received from their superiors, the nabobs or provincial governors, fiefs of more or less extent, for which they paid a certain due annually, being then exempted from all other imposts whatsoever. The dues paid by the zemindars were of course exacted, with additions, from the ryots or cultivators, and constituted a large part of the imperial revenue. Under the British government, the same system of tax-collection is continued in Bengal, the zemindars in that presidency being looked upon as the hereditary lords or proprietors of their respective districts. The zemindars of the Coromandel district were formerly called *polyghars*. Under the zemindars were the *havildars*, or heads of villages, whose duty it was to collect their share of the tax imposed by the zemindar, and as, like their chief, they took care to collect an additional proportion for themselves, the most atrocious oppression was commonly practised; the 'nabob' pillaging the 'zemindars,' the 'zemindar' in turn plundering his 'havildars,' while the 'havildar' more than reimbursed himself at the expense of the Hindu villagers.

ZEND,* the language in which are composed the

* Much uncertainty prevails as to the real meaning of the word Zend. The name *Zend-Avesta* (q. v.) is, by the native scholars, understood to mean commentary (*pehlev*) and text, an opinion supported by the most eminent Zend scholar of our day, Dr Haug. The opinion of Max Müller to the effect that Zend is identical with the Sanscrit *chhandas*—a name given to the Vedic hymns—and *Avesta* = *avasthāna*, a word which, if it occurred in Sanscrit, would mean settled text, requires further confirmation.

ancient sacred books of Zoroaster, first became known through Anquetil-Duperron (q. v.). Many scholars of eminence, like William Jones, Meiner, Henning, W. Erskine, and others, warmly contested the age of these writings. They held that the idiom in which they were couched had never been spoken in any part of Persia, but was a Sanscrit dialect which had been introduced from India for sacred use. The so-called Zoroastrian writings, they said, dated from the time of Ardesahir-Babegan, the first Sassanian, in 230 B.C., or had at least been rewritten and redacted at that time. The first who endeavoured to lay the foundations for a real grammatical knowledge of Zend was Rask, the Dane, who, in 1816, undertook a journey to India and Persia, in order to make researches into the origin and nature of this language on the spot. Although he did not live to make known all the results of his investigations, he yet proved irrefutably that the sacred language of the Parsees was closely connected with that of the Brahmans; or, in other words, that Zend was akin to Sanscrit, and that, like the latter, it had retained some of the earliest formations of the Aryan dialects. Eugène Burnouf followed in his steps. He was indeed the real founder of Zend studies in modern Europe. By the aid of his knowledge of Sanscrit and comparative grammar, he proceeded to decipher, for the first time, the sacred writings of Zoroaster in the original; while Anquetil-Duperron, who first made the *Zend-Avesta* known in a European garb, composed his translation only from a modern Persian translation. Both he and Bopp contended for the independent and ancient existence of Zend, holding that Sanscrit, being a new language which came from the north, was more likely to be derived from the Zend than the latter from Sanscrit. The opinion of Haug, the latest, and by far the most successful investigator of Zend language and literature, is, that Zend is almost identical with the most primitive—the Vedic—form of Sanscrit. We shall give in the following sketch the results of his studies, which unfortunately have as yet appeared only in the preparatory shape of essays.

The Zend idiom, in its widest sense, embraces two so-called 'Bactrian' dialects, which, together with the 'West Iranian' languages, i. e., those of ancient Media and Persia, form the stock of Iranian tongues. These tongues were once spoken in what the *Zend-Avesta* calls the 'Aryan countries' (*Airyā dashāvān*). The former, the 'East Iranian' or 'Bactrian' branch, has survived, in its two dialects, in the scanty fragments of the Parsee Scriptures only. The more ancient of them is called the 'Gātha dialect,' because the largest and most important pieces preserved in this peculiar idiom are the Gāthas, or songs; the younger or 'ancient Bactrian,' also 'classical Zend language,' is the one in which the greater part of the *Zend-Avesta* (q. v.) itself is written. Both dialects seem to have died out in the 3d c. B.C., leaving no linguistic progeny. The general character of Zend, in its widest sense, is that of a highly-developed idiom, inasmuch as it is as rich in inflections (there are no less than three numbers and eight cases) as is the Vedic Sanscrit, and is richer even than the Latin in the variety of forms inherent in its verbs and nouns. There are numbers of compound words in it; and the whole syntax bears the stamp of an advanced stage of linguistic progress. A genuine sister of Sanscrit, Greek, Latin, and Gothic, it is yet only known to us, much as is the Hebrew, in its declining phase. The forms are no longer accurately kept distinct, and a return to the originally uninflected state is noticeable, principally in the verba. It may be that the Bactrian grammar had never been properly

fixed by rules, and that, in the absence of that tender care which the Brahmans took of the preservation of the Sanscrit texts and idiom, many corruptions and abbreviations gradually crept from the colloquial into the classical language of Zend, and were thus perpetuated in the surviving remnants. As soon as the language of the Zoroastrian books died out from daily use, these books were mechanically copied, time after time; and any number of blunders, unchecked by an understanding of the structure or the details of the language, crept in unheeded. The oldest copies are the best, comparatively speaking: the more modern the copy, the oftener the terminations are found as separate words; vowels are inserted according to the faulty pronunciation of the writer; and a number of other faults, of omission or commission, are patent at first sight, solely due to carelessness and ignorance. Before indicating the general character of Zend, we shall briefly observe that its two dialects differ both phonetically and grammatically; and the phonetical differences are so great, that, at first sight, it would almost appear as if they were caused by different localities rather than ages, but, on closer inspection, it is found that the singing of the Gāthas, whereby certain vowels were lengthened out, has caused many of these striking peculiarities. Grammatically, the Gātha dialect shews many deviations from Zend, traceable to the more primitive state of the Bactrian language which it represents. But the differences between the two are not so great as between the Vedic and the classical Sanscrit, and between the Greek of Homer and the Attic dialect. At most, the Gātha may be reckoned to be one or two hundred years older than that classical Zend which formed the classical language of the ancient Iranian Empire, as depicted in the earlier parts of the *Shāh Nāmah*.

There are twelve simple vowels and about fourteen diphthongs in Zend, for each of which there are special characters. Of vowels peculiar to this idiom, may be mentioned the *ā* (long, with a nasal sound), used chiefly in the genitive plural termination; further, the *ē*, which, in the Gātha dialect, often replaces the final *ō* of the usual Zend, and which, by the frequency with which writers confound it with *ī*, would also prove itself closely allied to that sound. There is, further, an initial *a* to be observed, which probably crept into the Zend texts when they were transcribed into their present characters, which, no doubt, are borrowed from the Syriac. This *a* corresponds to the Aleph prosthetic of the Semitic idioms. Again, the short vowels are always lengthened at the end of a word in the Gātha dialect: owing most probably to the circumstance that the Gātha literature—the most sacred hymns—were sung, and the singer's voice resting upon the final vowel, whether long or short, had the effect of lengthening it even in the MSS., written mostly from memory. Of consonants, there are 6 gutturals, 2 palatals, 4 dentals, 3 labials, 4 semivowels, 5 sibilants, 5 nasals. The roots are mostly monosyllabic, consisting occasionally of one vowel only, or being a combination of a vowel with a simple or double consonant, or of two consonants with a vowel between them; e. g., *i*, to go; *dā*, to give; *gā*, to go; *mere*, to die; *as*, to be; &c. Additional sounds added to the simple roots, enlarge and otherwise change the meaning of a word—*dā*, to make, becomes, by the addition of *th*, *dath*, to place; from *mere*, to die, is derived *meretich*, to kill. Three chief modifications are to be noticed in the verbal roots, irrespective of tense and mood—viz., the 'causal form,' expressing the idea of 'to make,' 'to get made,' which is formed by lengthening the vowel of the root, and adding the syllable *aya*, as

in Sanscrit. Next stands the desiderative form, expressing the wish of obtaining anything, which is formed by the reduplication of the first syllable, and the addition of *s* to the crude form before the terminations. The last or intensive form, used to render the verb more emphatic, was originally produced by a simple reduplication of the root and the termination; afterwards, only the vowel of the first part was lengthened, and the consonants following were omitted. Three voices—the active, middle or reflective (Lat. deponent), and the passive—obtain in Zend, as in Greek and Sanscrit; and there are four chief moods, which may be used in all these three voices—the indicative, subjunctive, potential, and imperative. The subjunctive is of a double nature, the one expressing the 'might, would, or should,' the other the 'may'—a feature lost in classical Sanscrit, and only to be met with in the ancient language of the Vedas. The potential, too, is of two kinds, corresponding to the Sanscrit 'potential' and 'precativa.' There are as many tenses in Zend as there are in Sanscrit, though fewer than in Greek, which is, in this respect, the richest of the Aryan stock. There may be distinguished one formation for the present, four for the past, and two for the future.

The general scheme of the (active) present and imperfect is as follows:

| PRESENT. | | IMPERFECT. | |
|----------------|----------------|---------------|--------------|
| Active Voice. | | Active Voice. | |
| Sing. 1. mi. | 2. hi. | Sing. 1. m. | 2. a, ō. |
| 3. ti. | Dual 1. vahi. | 3. t. | Dual 1. āva. |
| 2. (lost.) | 3. (lost.) | 2. (lost.) | 2. (lost.) |
| 3. tō, thō. | Plur. 1. mahi. | 3. tem. | Plur. 1. ma. |
| Plur. 1. mahi. | 2. tha, dūm. | 2. ta. | 2. ta. |
| 2. tha, dūm. | 3. ſti. | 3. en, aſi. | 3. en, aſi. |
| 3. ſti. | | | |

The division of the 'crude' forms into ten classes, in use with the grammarians of Sanscrit, is also fully applicable to the Zend. Additions and reduplication make up the distinguishing features. The past tenses are likewise formed, as in the sister tongues, by augmentation, reduplication, or composition. Apart from those forms which are identical with those employed in Sanscrit, Greek and Lithuanian, Latin, and the ancient Teutonic languages, we find the use of two kinds of subjunctives. Equal richness of forms is found in the participle and the infinitive, whilst there are fewer gerundial forms than in Sanscrit. Nouns are formed out of roots by the addition of suffixes, which generally correspond to those of the cognate languages. There are three genders in Zend—masculine, feminine, and neuter. The comparative and superlative are formed very nearly as in Sanscrit and Greek. The number of compound nouns in Zend is somewhat less than in the Sanscrit and Greek, on account of its standing nearer the more simple Vedic idiom. There are three numbers and eight cases of inflection for singular and plural of nouns; while there are no less than five cases in the dual, no other Aryan language having retained more than three. The terminations of the cases (in words ending with a consonant) are somewhat according to the following scheme:

| | SING. | DUAL. | PLURAL. |
|--------|---------|-------|--------------------|
| Nom. | s. | ſa. | ō (aſ). |
| Accus. | em. | ſa. | ō, mā. |
| Instr. | a. | ſya. | bi. |
| Dat. | ē. | ſya. | byō (byeſ). |
| Ablat. | at. | ſo. | byō. |
| Gen. | ō (aſ). | ſo. | ſm. |
| Locat. | i. | yo. | aſhan, aſhva, hva. |
| Voc. | = Nom. | ſ. | |

There are only pronouns of the first and second persons to be found in Zend, the third being made

up by a demonstrative pronoun. There are some older forms to be found in the Gátha dialect only. Most of the pronouns resemble closely the Sanscrit forms. The relative is sometimes used as a demonstrative. The numerals from one to ten are : *séva*, *dva* (*va*, *dugé*, *ayé*), *thri*, *chathware*, *poicha* (*meida*), *kshshvas* (*kshahvidem*), *hapta*, *asta*, *nava*, *daça*. The following numbers are formed by the addition of the single cardinal numbers to the ten or *daça* : 20 = *viçaiti*, 100 = *çatem*, 200 = *duye çaité*, 1000 = *hazanra*, 10,000 = *baéva*, 100,000 = *ahókhsata*. The ordinals are : *paoirya*, first; *bitya*, second; *thriya*, third; *khtúiryah*, fourth; *pukhdha*, fifth; &c. 'Multiplication numerals' are formed by addition of *keré* and *cat*—e. g., *hakeret*, *çnoe*; *bizhvát*, twice; *thrizhvát*, thrice; &c. Particles and propositions are often identical with those of Sanscrit. The latter may be separated from the verb, if forming part of it, as is the case in the Vedic and Homeric languages, but not in classic Sanscrit or Greek.

We have started with the now fully proved assertion that Zend is closely allied to Sanscrit, more especially to the ancient Vedic dialect. To the latter it bears about the same affinity which the different Greek dialects (*Æolic*, *Doric*, *Ionic*, *Attic*) bear to one another. The ancient Brahmans and the Parsees are but two tribes of the nation which is called Aryas both in the *Veda* and *Zend-Avesta*, the former somewhat to be compared to the Ionians, the latter to the Dorians. But in comparing Zend with Sanscrit, it is noticeable that it resembles more the primitive Vedic than the classical Sanscrit. In verbal forms, chiefly moods and tenses, the classical Sanscrit is much poorer than it is in its primitive Vedic phase, having lost various forms of the subjunctive mood, most tenses of all other moods, except indicative, the manifold forms expressing the infinitive mood, while all these are found completely preserved in the *Vedas*, *Zend-Avesta*, and Homeric Greek. From these and many other signs, it would indeed follow as if the classical Sanscrit had been formed long after the separation of the Iranians from the Hindus. The differences between the Vedic, Sanscrit, and Zend are very minute in grammar, but important both phonetically and lexicographically, like the difference between German and Dutch. But the philologist can easily transform, by slight phonetic changes, the Zend word into the Sanscrit one. As a striking proof of the original identity of grammatical forms between the two, the circumstance may be cited of their both exhibiting certain identical irregularities.

For *Zend Literature*, we may refer both to our articles on PERSIAN LANGUAGE AND LITERATURE and to ZEND-AVESTA. We confine ourselves here to a brief mention of the principal items. At the head stand the five Gáthas, which may safely be ascribed to Zoroaster and his disciples themselves. There is no doubt that what now survives is but a scanty fragment of what once existed of this literature. Probably they but represent a selection of verses considered most efficacious for putting down evil influences, and for increasing the welfare of the Zarathustrians. The Gáthas, as they now stand, may be compared to the *Sāmaveda*, which contains selections from the *Rigveda*, used at the *Soma* sacrifices. Next in order stand the *Yasna*, or seven chapters, containing songs and prayers, which dates from a much later period; and here again the first portion, or 'Younger *Yasna*,' is of still later date; and on the same line stands the *Visparad*, the collection of prayers called 'All Heads,' in 23 chapters. The *Vendidad*, on the other hand, represents conversations held by Zoroaster with *Ahuramazda* on religious topics, and is most likely the work of the high-priests of the Iranian community of later

periods. The *Yahts*, or songs and conversations, are the latest. The age of the different works mentioned is fixed by Haug in the following manner: The Gáthas about 900 or 1200 B.C.; the larger portion of the *Vendidad* at about 900 or 1000 B.C.; the younger *Yasna*, about 700—800 B.C.; the latest part of the *Vendidad* (the '*Pazend*') being written as late as 500 B.C., when the collection of the different parts also seems to have taken place. This computation would give the Zend, or rather the famed Parsee literature, a range of about 800 years, or from 1200—400 B.C. Cf. Haug's *Essays on the Religion of the Parsees* (Bombay, 1862).—See PERSIAN LANGUAGE AND LITERATURE, ZEND-AVESTA, ZOROASTER.

ZEND-AVESTA, or rather (as the Pehlvi books have it), AVESTA-ZEND, is the name of the sacred writings of the Parsees (q. v.). The word *Avesta* (*avastha*) means text, scripture; Zend, or Zand, translation or commentary and paraphrase. According to the last researches in this province, it would seem as if only a small portion of the entire collection now extant were formed by *Avesta*, or text, the rest being made up of *Zend*, or commentary, without text. The term *Zend* has indeed changed its meaning repeatedly. From an authoritative interpretation, emanating from the highest source, in time becoming embodied in the text itself, it came to denote, later, a translation into the native idiom of Persia (the Pehlvi), made by the Zoroastrian priests during the Sassanian period. There is further a special 'Zend doctrine' to be noticed, which differs considerably from that contained in the *Avesta*. A still further explanation of that *Zend* doctrine is the *Pazend*, a word often to be met with in connection with *Avesta* and *Zend*. Of this we shall further have occasion to speak.

But before proceeding with an elucidation of the contents and purport of these *Zend* writings, we must devote a brief space to a sketch of their history, or rather of the different phases the acquaintance with them on the part of the West has undergone. The doctrine of the 'Magi,' as the ancient world was wont to call the priests of Zoroastrianism, as well as those of India, Persia, and Babylonia, is first alluded to in *Jeremiah*, where the chief of the Magi is mentioned among *Nebuchadnezzar's* retainers. In the *New Testament* (*Mat. ii. 1*), Magi come to worship *Jesus* at *Bethlehem*. The earliest account among Greek writers is furnished by *Herodotus*, who, on the whole, seems well enough informed for his time. Besides him, we hear of accounts by *Ctesias*, the Greek physician of *Artaxerxes II.*, by *Deinon*, *Theopompos*, and *Hermippos*. But only fragments from their writings have survived, embedded chiefly in *Plutarch* and *Diogenes Laertius*. *Pliny*, *Strabo*, *Pausanias*, *Dion Chrysostomus* further enlarged the stores of knowledge, which, more or less trustworthy, may be gathered from independent sources. Omitting later Greek writers, such as *Damascius*, *Theodorus of Mopsuestia*, &c. we turn to *Armenian* writers of the 5th Christian century. Among them we find *Eznik* and *Elizeus*, from whose records we may gather that the Zoroastrians at their time were split into two parties, the one called *Mog*, the other *Zendik*; the former inhabiting chiefly the western parts—*Media* and *Persia* principally acknowledging the *Avesta*; while the latter, living principally in the east (in *Bactria*), followed the traditional explanations, or *Zend* proper. To the Arabic writer *Masudi* (950 A.D.) we owe a comparatively correct account of the sacred book; while *Sharastani* (1153 A.D.) is perhaps the first among his countrymen who ranks the Zoroastrians with those other professors of Semitic creeds, the *Mohammedans*, *Jews*, and *Christians*, and not among the idolaters

and pagans. In his time, they were already split into many sects, those who believed in the transmigration of souls, like the Brahmans, Buddhists, &c. As a successfully carried out piece of deception, it is to be noticed that Mohammedan writers, for the most part, seem to countenance the fable palmed upon them during the times of persecution by the Magi, that Zoroaster was identical with Abraham—in which there is not one atom of truth. The nations of modern Europe came into contact with the adherents of Zoroastrianism in the western parts of India, and in the 17th c., some MSS. of their sacred books were brought to England. But no one was able to read them; and Hyde himself, the celebrated Oxford scholar, was unable to make any use of them when, in 1700, he wrote his learned work on the Persian Religion. A sort of romantic freak first put Europe into the possession of the key to this book, the language of which had been lost for above a thousand years. A young Frenchman, Anquetil-Duperron, happened to see a few pages that had been copied from a Zend MS. in the Bodleian Library, and he instantly resolved to betake himself to India in quest of the original Zend writings. To achieve this purpose, he, being without means, had to go as a sailor on board a ship belonging to the French India Company, bound for Bombay, in 1754. The French government, however, stopped in shortly afterwards, and furnished him both with money to purchase MSS., and with a pension, that he might pursue his studies with greater ease. He prevailed upon several of the dusters, or learned priests, to introduce him into the mysteries of the holy language and rites, and further to sell him some of the most valuable works couched in it. When he considered himself sufficiently competent in Pehlvi and Zend, he commenced a translation of the whole Zend-Avesta in French, in 1759. Two years later, he returned to Europe; and having convinced himself, by a comparison with the Oxford MSS., that those he had acquired of the sacred writings were genuine, he went to Paris, where he deposited his treasures—180 MSS. in different oriental languages; and published, ten years after leaving India (1771), the first European translation of the Zend-Avesta, to which was added a great deal of supplementary matter, bearing more or less on the subject. The work created a profound sensation throughout Europe; but, after a while, voices began to be heard by no means so favourable as had been anticipated by the bold and persevering discoverer. Apart from the objections raised against the new book by Immanuel Kant the philosopher, on the score of its not containing any traces of philosophy, a much graver question was ventilated in England—viz., that of its authenticity. It was not that Anquetil was charged with forgery, but the priests, it was said, had found in him a ready dupe. It was principally Sir William Jones, who, in a trenchant letter addressed to Anquetil-Duperron (in French, being, as Sir William Jones said, the only language which Anquetil understood—a *little*), tried to prove the utter untrustworthiness of the whole work. He was aided therein by Richardson, the Persian lexicographer, who, from four reasons—neither of which, however, is valid—came to the conclusion that the book was a spurious fabrication. While in France there was but one opinion on the subject—viz., that English scholars were trying to run down the work out of sheer spite and jealousy—the opinions of Germany were rather divided. Some, like Meiners and Tychsen, fully acceded to the proofs arrayed against it; but there arose another renowned German scholar, Klenker, who, in token of his complete and unreserved trust in the genuineness, set about translating Anquetil's

French translation into German, adding several appendices, &c., and principally pointing out the now generally recognised agreement between the more important heads of the doctrines as contained in the book and in the classical writers. Thus matters stood for a long while. In Germany, Anquetil's translation, as rendered by Klenker, became the standard work even for theologians; in England, none any longer thought about it, it having been fully agreed upon by the highest authorities that it was nothing but a clumsy forgery. More than fifty years had elapsed from the appearance of that work, when a Dane, Rask, undertook to look into the matter. Having himself acquired many Zend and Pehlvi MSS. in Bombay for the Copenhagen library, he wrote (1826) a pamphlet, in which he first shewed not only the close affinity between the language of the Zend-Avesta and Sanscrit—which had been pointed out by Erakine and others before—and further proved it to be, not a corruption of Sanscrit, but a distinct language. He also proved that modern Persian was derived from Zend, as Italian from Latin—a step which at once removed all doubts about the genuineness of the work, and confirming, however, how, to a certain extent, Anquetil, to whom all praise was due for having been the first pioneer, had, through the absence of the requisite philological aids, been occasionally misled in his version in the most woeful manner. The learned duster himself—with whom Anquetil communicated only in Persian—though well acquainted with the Parsee traditions, and favouring mostly the general sense of the passages, yet possessed no grammatical knowledge whatsoever of the language he pretended to teach. Rask had pointed out the way; Eugène Burnouf followed it. He indeed may be called the founder of Zend philology. For more than twenty years, this eminent scholar devoted all his energies to elucidating, commenting, and discussing this language and the sacred writings couched in it, and in publishing texts and translations. In Germany, Olahausen, Bopp, Müller, Brockhaus, Spiegel, Haug; in Copenhagen, Westergaard, have been busy ever since in editing and translating either portions of or the entire Zend-Avesta; and though the rediscovery of the language is by no means an accomplished task, yet, thanks to their indefatigable labours in this field, we are certain that, sooner or later, we shall be in the full possession of all the facts connected with the language and its sacred depository, the Zend-Avesta.

We now address ourselves to the book itself. We know, both from the Parsee traditions and from independent classical witnesses, that the Zend-Avesta was originally of very vast extent, incomparably vaster than the work that now exists under that name. Pliny speaks of 2,000,000 verses composed by Zoroaster; and an Arabic writer, Attavari, mentions the number of 12,000 cowskins (parchments) of which Zoroaster's writings consisted. No doubt these are but round Eastern figures; but it may safely be assumed that the sacred literature in question must once have been of very great extent. The Parsees ascribe its loss to Alexander the Great, but it is more likely that their traditions in that respect refer to the Mohammedan conquests. Yet even then, the greater part of the sacred literature was already lost, and the date of Alexander may in so far be correct, that the Greek ideas that followed in his wake turned the believing minds from the primitive faith, and carried a gradual neglect and loss of the documents in which it was contained, with it. For 600 years—from the Macedonian conquest, 335 B.C., to the accession of the Sassanians to the throne of Iran, 235 A.D.—the Zoroastrian religion was not supported by any kings, and decayed in

consequence. But when the Sassanians assumed the rule, their principal endeavours were directed to the revival of the ancient faith; and their unceasing researches after the ancient fragments of the Zoroastrian gospel have resulted in the small collection which we now possess. Yet the names and the summaries at least of all or most of the lost portions have survived. The whole scripture is reported to have consisted once of 21 nosks, or parts, each containing Avesta and Zend—that is, text and commentary on it. The number 21 was to correspond to the 21 words of which the most sacred prayer of the Zoroastrians (the Honovar) was composed. The first of these sections comprised 33 chapters, containing the praise and worship of angels; the second (22 chapters) contained prayers and instructions to men about good actions; the third (22 chapters), an explanation of religious duties and commandments, and the way to avoid hell and acquire paradise; the fourth (22 chapters), knowledge of both this and the future worlds and their inhabitants, revelations concerning heaven, earth, water, trees, fire, men, and beasts, the resurrection of the dead, and the passing of the bridge Chinvat; the sixth (35 chapters) treated of astronomy, geography, astrology; the seventh (22 chapters), of food, lawful and forbidden; the eighth (50 chapters, of which, at the time of Alexander, only 13 were extant) treated of the different heads or chiefs in the creation; and the ninth (in 60 chapters) contained a code of laws for kings, governors, &c.—also a portion about the sin of lying; the tenth (60 chapters) treated of metaphysics, natural philosophy, divinity, &c.; the eleventh (60 chapters) treated of the reign of King Gustasp, and his conversion to the religion, and its propagation by him through the world; &c. Of all the 21 nosks, however, one only, the twentieth (in 22 chapters), called the Vendidad, has survived complete. This treats of the removal of uncleanness of every description, from which great evils arise in the world. Some fragments of the other parts only, chiefly the fourth and eleventh, have survived. But there are now in sacred use among the Parsees other books either not included in the foregoing list, or but imperfectly indicated in it. Of the former are the *Yazna* (*Izeshne*) and the *Visparad* (*Visporatu*). To the latter class belong 24 sections called *Yashts*, and some small prayers of different kinds, such as *Afrigan*, *Nijayish*, *Gâhs*, and *Sirozah*, or *Calendar*. Before speaking of these books, we shall say something about their authorship, for which point we further refer to ZOROASTER (q. v.). By the unanimous consent of both classical writers and the Persians, the whole bulk of the sacred literature is ascribed to Zoroaster himself. They were supposed to be the substance, or, as was held afterwards, the very words of divine revelations from God to the prophet, in the form of conversations. These revelations do not at first appear to have been committed to writing, but to have been orally preserved by his disciples and adherents, and to have been handed down by them to posterity. Surprising as this may seem at the sight of what has remained, as the infinitely larger bulk even of what has perished, it must be borne in mind that, e. g., the Vedas, the Talmud, and the Sunnah have been preserved equally faithfully in the mouths of many generations. The name Zoroaster or Zarathustra—in as far as to him is ascribed the authorship of the whole of the sacred writings—is to be taken collectively rather than individually, i. e., as indicating a school of successors and high-priests of the founder, who is designated Zarathustra *Spitama*; while the chief divines who took his place in after-times were only called

Zarathustra. That their decisions and sayings were afterwards 'hedged in' with the same reverence as those of the founder himself, need not be argued at length. All that can really be held to emanate from the prophet himself are the five *Gâthas*, which form part of the *Yazna* (Sansc. *yajna*, sacrifice). This *Yazna* consists principally of prayers to be recited at the sacrificial rites—such as the consecration of the *Zôthra*, or holy water; of the *Bareçona*, or bundle of twigs of a particular tree; the preparation of the sacred juice of a plant called *homa*—the Indian *SOMA* (q. v.)—taken to be an emblem of immortality; the offering of certain cakes; &c. The whole of the *Yazna* now comprises 72 chapters, probably corresponding to the (twelve times six) 'seasons' during which Ahuramazda created the world. It consists apparently of two parts belonging to different periods. The older is written in what Haug calls the *Gâtha* dialect (see ZEND), and was considered sacred even at the time when the other books of the Zend-Avesta were composed. This 'older *Yazna*' was divided again into the *Gâthas* and some minor pieces. The former, five in number, are small collections of (metrical) sacred prayers, songs, and hymns, exhibiting philosophical and abstract thoughts about metaphysical subjects. The name itself signifies 'song.' Their metre resembles chiefly that of the Vedic hymns. They are without rhymes, and only the syllables are counted. The first bears the heading (which is also intended for the other four), 'The Revealed Thought, the Revealed Word, the Revealed Deed of Zarathustra the Holy; the Archangels first sang the *Gâthas*.' They are all more or less devoted to exhortations on the part of the prophet to forsake polytheism (the devas, or gods), and to bow only before Ahuramazda. The difference between monotheism and idolatry is pointed out in the respective sources whence they flow—viz., 'existence' and 'non-existence.' The mission, activity, and teaching of Zoroaster are dwelt upon more or less in all *Gâthas*, but chiefly in the second. To the other portion belongs further the '*Yazna* of seven chapters,' which seems to have been composed by early disciples, and which consists of prayers in prose, addressed to Ahuramazda, the angels, the fire, the earth, the waters, and other spiritual beings—genii presiding over the different parts of the good creation; further, over devotion, speech, &c. There is further a chapter containing a formula by which the ancient Iranians were received into the new religious community. The so-called younger *Yazna*, written in the common Zend language, is of more varied contents, such as, an invitation to Ahuramazda and all the good spirits to be present at the sacrifice; further, pieces referring to the preparation and drinking of the *homa* juice; next, the praises of the genius *Serosh*, and a commentary on the most sacred prayers. The *Visparad*, which forms the next most important part of the Zend-Avesta, contains a collection of prayers, composed of 23 chapters, written in Zend (not *Gâtha*), and resembling the younger *Yazna*. They refer to the same ceremonies—the preparation of the sacred water, consecration of certain offerings, &c. Next are to be considered the *Yashts*, in 24 divisions. *Yasht* (*yest*) means worship by prayers and sacrifices, and in the Avesta indicates certain laudations of sacred persons and objects—*yazatas* (*izad*) = angels; and in so far different in nature from the invocations in the *Yazna* and *Visparad*, that, while in the latter the divine beings are invited promiscuously, the single *Yashts* are addressed to individual numina, such as the archangels, the sun, the heavenly water, the star *Tisfrya*, &c. In these songs—the work of Median bards, probably—are also found the primary

sources of the legends contained in the Shâh-nâmeh (q. v.). Before speaking of the Vendidad, the 'Pentateuch' of the Zoroastrian 'canon,' we shall yet briefly mention some smaller pieces, which are now used as common prayers by the Parsees, such as the five *Niydyish*, or praises, addressed to the sun, the moon, the water, and the fire; the *Afrigâns*, or blessings to be recited over a certain meal prepared for an angel or a deceased person; the five *Gâhs*, or prayers to the angels set over the five different times of the day and night; and finally, the *Sirozah*, or thirty days, being a calendar, or rather an enumeration of the thirty divine beings that preside over each of the days. It is chiefly recited on the thirtieth day after the death of a man. The *Vendidad*, to which we now turn, is the code of religious, civil, and criminal laws of the ancient Iranians. It consists of 22 chapters or fargards = sections. It seems to have survived in a fragmentary state only, and is evidently the work of many hands and many centuries. It appears as if, starting from old sayings in the Avesta, the Iranian high-priests in various periods had interpreted them often at variance with each other: these their interpretations (*Zend*) were made the theme of further interpretations (*Pâzend*), and the three phases of interpretation were received in the course of time as equally authoritative among the faithful. There are three parts to be distinguished in the Vendidad. The first is introductory, containing an enumeration of 16 Aryan countries over which the Zoroastrian religion was spread; further, legends of King Yuria, and recommendations of agriculture. The second part (chaps. 4—17) forms, as it were, the groundwork of the Vendidad, treating of laws, ceremonies, and observances. The third part is a kind of appendix, treating of various subjects, chiefly of a medical kind, such as spells against diseases, &c. Here also ought to be mentioned the *Bundelesh*, written entirely in Pehlvi, which seems a compilation of several extracts and fragments of partly ancient, partly recent Zoroastrian writings, forming a sort of compendium or dogmatic handbook of Zoroastrianism. For an account of the latter, we refer to GUÉRRÉS, PARSEES, and ZOROASTER.—Burnouf, *Vendidad-Sadé*; Olshausen, *Vendidad Zend-Avesta*—French translation by Anquetil-Duperron, German by Klenker; Spiegel (the German text, with Spiegel's commentary, retranslated into English by Bleek); Rask, *Aller und Aeltheit der Zendsprache*; Haug, *Essays*; &c.

ZENGG, SENJ, or SEGNA, an important fortified seaport town of Austria, in Military Croatia, on the Adriatic, 71 miles south-east of Trieste, at the termination of the Josephine Road, opposite the island of Veglia. Z. is the see of a Roman Catholic bishop, has a tolerably large and elegant cathedral, an upper gymnasium, a seminary for priests, an academy, and school of navigation; a small harbour (free), somewhat unsafe; and some trade in grain, honey, wax, wine, salt, tobacco, wood, fish, and cattle. Pop. 5000.

ZE'NITH, a word, like *Nadir* (q. v.), borrowed from the Arabic, is the name given to that point of the heavens which is directly overhead, i. e., in line with the spectator's position and the centre of the earth. It is thus the upper pole of the spectator's horizon, as the nadir is the under pole. The word would seem to be connected with the Arabic *an*, a 'point.'

ZENJA'N, a populous and thriving town of Persia, in the province of Irak-Ajemi, about 170 miles north-west of Teheran, and 70 miles south-south-west of the Caspian Sea, on the table-land of Azerbaijan, at the junction of the roads from Hamadan

and Teheran to Tabriz, on a tributary of the Kizil-Ouzen, which flows into the Caspian. It is surrounded by orchards, has old walls, a palace, a mosque, bazaars, and a trade in carpets, woollen cloths, arms, lead, and gunpowder. Pop. estimated at 15,000.

ZENO, a philosopher of Elea, a town of Lucania, in Italy, was a favourite disciple of Parmenides. He visited Athens, and the illustrious Pericles was one of his pupils. According to the account usually given, on his return to Elea, he joined a conspiracy to deliver his native town from the tyrant Nearchus, and on the failure of his plot, was captured, and put to the torture. On being interrogated as to his accomplices, he named the principal courtiers, and is said to have bit his tongue off, and spat it in the tyrant's face. However, the historical evidence for this account is unsatisfactory; and whether Z. perished in his attempt or survived the tyrant, is uncertain. He held the usual doctrines of the Eleatic school respecting the unity and the immutability of all things, distrust in knowledge acquired through the senses, and reliance on pure reason. He did not deny that there were phenomena or appearances, but he maintained that these were not real existences. In this he anticipated the Berkeleyan theory. But he is chiefly remarkable for having been the first to employ the style of argument known by the name of Dialectics, in which error is refuted, and truth sought to be established, by the *reductio ad absurdum*—a method so skillfully employed afterwards by Socrates and Plato. He devoted his great powers of argumentation to enforce the doctrines first broached by Xenophanes, and more systematically developed by Parmenides. His works were in prose, but only small fragments have been preserved.

ZENO, founder of the Stoic philosophy, was born at Citium, in Cyprus. The dates of his birth and death are uncertain. He flourished in the early part of the 3d c. B.C., and was a contemporary of Epicurus. His father was a merchant, and on his trading voyages brought home with him from Athens some writings of the Socratic school. By these, Z. is said to have been attracted to the study of philosophy. At the age of 30, he was shipwrecked off the coast of Athens, and having lost his property, he willingly adopted the Cynic doctrines, in which contempt for riches is conspicuously taught. He attached himself first to Crates, but soon became dissatisfied with the coarse, ostentatious disregard for established usages, and the indifference to speculative inquiry, which characterise the Cynic sect. He next joined the school of the Megaric Stilpo, and there became a proficient in the art of disputation. Still unsatisfied, he betook himself to Polemo the Academician. Having thus made himself master of the tenets of the various schools, he proceeded to open a school for himself, wherein he might shew forth the result of all his inquiry, and develop his own peculiar system. See STOICS. He selected for the purpose the 'Painted Porch' (*Stoa Poikile*), from which his sect has got its name, and there, till his 98th year, as is said, continued to teach those doctrines, which, in spite of serious drawbacks, inculcate that manly energy and simplicity, fortitude under suffering, and reverence for moral worth, which made disciples of so many of the noblest characters among the Romans. As a man, Z. deserved and gained the highest respect. The Athenians honoured him with a gold crown and a public burial, and his countrymen erected a monumental pillar to his honour. Of his numerous writings, scarcely anything remains save the titles.

ZENO'BIA, queen of Palmyra, succeeded (267 A.D.) her husband Odenatus, who had been acknow-

ledged by Gallienus as his colleague in the Roman Empire. Nearly the whole of the eastern provinces submitted to her sway. When Aurelian assumed the purple, he marched against her with a large army, and after defeating her in several battles, besieged her in Palmyra. Her hopes of being relieved by the Persians and Arabians being disappointed, she attempted to escape by flight, but was captured, 273 A.D. Before the conqueror, her courage failed, and she saved her own life by imputing the blame of the war to her counsellors, especially the celebrated Longinus, who was accordingly put to death. Z. was led in triumphal procession at Rome, decked with splendid jewels, and almost fainting under the weight of gold chains. She was presented by her conqueror with large possessions near Tivoli, where, in the society of her two sons, Heronnius and Timolans, she passed the rest of her life in comfort and even splendour. She was a woman of great courage, high spirit, and strikingly beautiful. With purity of morals in private life, she combined prudence, justice, and liberality in her administration. Her literary acquirements were considerable; she spoke Latin and Greek, as well as the oriental languages, with fluency. The balance of authority is said to be in favour of the belief that she was attached to the Jewish faith.

Z'ENTA, or SZENTA, a town of Hungary, in the county of Bacs, on the right bank near the Theiss, 120 miles south-south-east of Pesh, in a beautiful plain. Cattle-breeding is carried on. Pop. 15,000. It is celebrated for the victory of Prince Eugene over the Turks in 1696.

ZE'OLITE (Gr. *zeo*, to boil), the common name of a large group of minerals, often called the Zeolitic family. They receive this name from their melting before the blowpipe. They are all soluble in acids, and most of them gelatinise in acids in consequence of silica being set free. They are hydrated silicates of alkalis or alkaline earths, most of them containing alumina. Magnesia is rarely present in them. Their composition, however, is very various. They are generally found in amygdaloidal cavities, or in fissures of trap and other Plutonic rocks, as granite and gneiss, apparently as deposits from water percolating through the rock. They sometimes, but rarely, occur in veins. They are found either in crystals or of crystalline structure, often in plates or fine scales, often in needles or fibrous. Among them are *Analcime*, *Natrolite* or *Mesotype*, *Scolecite* or *Needle-stone* (*Needle Zeolite*), *Stilbite*, *Heulandite*, *Brewsterite*, *Apophyllite*, *Chabasite*, *Harmotome* or *Cross-stone*, and *Laumonite*. The number of species and varieties which have been described and have received distinct names, is very large.

ZEPHANIAH (the name probably signifies a 'watcher of the Lord'), a Hebrew prophet who flourished during the reign of Josiah, in the latter part of the 7th c. B.C. The subject-matter of his brief 'prophecy' is the temporary desolation of Judaea ('I will utterly consume all things from off the land,' i. 2), on account of the infidelity and worldliness of the inhabitants, Jerusalem being specially assailed by the author for her filth and pollution; the tyranny and the rapacity of her rulers, and the violence and treachery of her priests and prophets. At the same time the prophet predicts the destruction of the surrounding heathen nations, the Philistines, the Moabites, Ammonites, Ethiopia, and Assyria. The close, in which he declares that God will leave a righteous remnant in Israel, and for their sakes will ultimately bless the land with permanent peace, is couched in a strain of tender exultation.

ZERBST, capital of the former duchy of Anhalt-Zerbet (see ANHALT), a town of North Germany, in the duchy of Anhalt-Dessau, 10 miles north-west of the town of Dessau, and 68 south-west of Berlin, is situated on a level sandy spot on the river Nuthe, a tributary of the Elbe. It consists of a walled town, with four suburbs. Close to the town is a beautiful large palace, the ducal residence. The town has four Protestant churches, a Roman Catholic one, and a synagogue. The church of St Nicholas is a beautiful specimen of Gothic architecture. The town is the seat of a court of justice; has a high school, called the Francisceum; female, industrial, and other schools; a house of correction, and orphan asylum, hospitals, and a workhouse. The chief manufactures are articles in gold and silver, silk, wax, soap, stone-ware, carriages. There are many breweries, whose produce is exported in large quantities. The vegetable products are considerable, and the culture of hops is carried on. Handsome baths have been erected over a mineral spring recently discovered here. Pop. 11,379.

ZEULENRO'DA, a town of the North German Confederation, in the principality of Reuss-Greiz, 10 miles west of the town of Greiz, and 51 south-south-west of Leipzig, stands on a high plateau, in a wooded hilly district. Z. has suffered severely at various times from conflagrations, and is now regularly built, consisting of a walled town and four suburbs. It has a spacious market-place with a beautiful court-house, two churches, a burgher and free school, and a hospital. Besides some bleach-works and a trade in cattle, there are manufactures of woollen goods, especially hosiery, the fineness of which is famous. Pop. 5200.

ZEUS (Sansc. *dio*, light, *djau*s, heaven, *devas*, god; Lat. *Ju-piter* and *Dies-piter*, i. e., Father Zeus; Ang.-Sax. *Tiu*, whence Tuesday) was the greatest of the national deities of Greece. According to the most received mythology, he was the son of Cronos and Rhea, brother of Poseidon and Hera, the latter of whom was also his wife. He expelled his father and the older dynasty of the Titans; assumed the sovereignty of the world, and successfully resisted the attacks of the giants and the conspiracies of the gods. In the allotment of the world, after the dethronement of the Titans, Z. gained the rule of heaven and air, Hades of the infernal regions, and Poseidon of the sea; while the earth was left subject to the influence of all three, though Z. was regarded as having the supremacy throughout all departments. Crete, Dodona, and Arcadia were the places where the worship of Z. was most cultivated; and although originally the inhabitants of these places may not have looked upon themselves as worshippers of the same god, yet, in process of time, all the local gods revered under the name of Z. were at last merged in one great Hellenic divinity; a process which was carried still further out when he was identified with the Jupiter of the Romans and the Ammon of Libya.

Besides the epithets of Z. from the seats of his worship, he had many titles applied to him from his various powers and functions, moral and physical. He was the father and king of gods and men; the protector of kings, of law and order; the avenger of broken oaths and of other offences; he watched over the state, the assembly, the family, over strangers and suppliants; his hand wielded the lightnings and guided the stars; he ordained the changes of the seasons, and, in short, regulated the whole course of nature. All prophecy, too, was supposed to originate in him, and it was from him the prophetic god Phœbus received his oracular

gift. He dispensed, as it pleased him, both weal and woe to mortals; but whether he could control the Fates themselves, is a point about which the ancients disagreed, as men have done in all ages where the question of free-will and fate is concerned. Of the many epithets applied to Z., perhaps the best known is the Olympian, from that Olympus in Thessaly whose summit was believed to be his residence as well as that of the other gods. His most celebrated festival was the Olympic, held at Olympia, in Elis, after the end of every fourth year.

Combined with such exalted conceptions of the majesty and power of Z., we find many stories current respecting his amours with mortals and immortals; he is represented as acting with caprice, anger, deceit. Probably, in many cases, an ancient Greek of average position and capacity did not view such matters with any very strong feeling of disapprobation. Others, again, as Xenophanes (q. v.), protested against the transference to the gods of human passions and failings; or, as Pindar, maintained that they would believe nothing of the gods that was discreditable to them; or, as Euripides, argued that such tales were sufficient to disprove their divinity; or, as Euhemerus, held that the local worship of Z., like that of other deities, was owing to the fact, that divine honours were paid to deified men at the place of their burial, and that of course it was no wonder to find human actions assigned to gods who had once been human. In modern times, the various myths were at one time explained as symbolical of various celestial and terrestrial phenomena, such as the apparent motion of the sun, the alternation of day and night, the changes of the seasons, and so forth. The most rational explanation is as follows: In early times, men thought and spoke of natural objects as if they were personal agents, employing names for them which were literally, not symbolically significant. But from lapse of time, and the departure of various tribes from their original seats, in many countries the meaning of these words became obscured, and though men still used them, their real significance was forgotten, and terms which originally had expressed some process of nature, were conceived to narrate some incident in the history of a person. For example, the expression that the sun follows the dawn, was misunderstood, and gave rise to the myth of Phœbus pursuing the nymph Daphne, because the word Daphne was no longer understood. Such misconceptions were then, by successive ages, elaborated into myths, more or less fanciful, and even revolting. In this respect, Z. has fared no better, or rather much worse, than the other deities. In the same way as the Greek war-god Ares is a personage much inferior to the Latin Mars, so the serious and unimaginative Roman's conception of his majestic Jupiter Optimus Maximus (the best, the greatest), was more elevated than that conceived of Z. by the sensuous Greek. But this might be expected from the different character of the two peoples. Except in the grander attributes of omnipotence and fatherly care of the universe, we can trace little in common; for the Jupiter of the Latin poets, as portrayed in Virgil and Ovid, is drawn entirely from Greek sources, and is merely the Z. of Greek mythology with an altered name.

ZEUXIS, the celebrated painter, was born at Heracles, probably the city of that name in Lucania. He is also styled of Ephesus, which means that he belonged to the Ionian school of painters. He flourished in the latter part of the 5th c. B. C., and was at Athens about the beginning of the Peloponnesian war. He excelled in the treatment of light and shade, in accuracy of imitation of natural objects, and in expressing the perfection of human,

and particularly female beauty. This last he effected by selecting the finest models he could find for each separate part. His most famous pictures were 'Zeus enthroned, with the Gods standing round;' 'Helen;' 'The Infant Hercules strangling the Serpents;' 'The Female Hippocentaur.' By the exercise of his art, he attained to great riches and fame, and like his rival Parrhasius, was exceedingly conscious of his pre-eminence. He repeatedly presented rather than sold pictures to cities that were anxious to possess them, because he thought no money-price could pay for them. Greece was plundered of many of his masterpieces by her Roman conquerors; and one of the noblest, the 'Hippocentaur,' was lost on the passage to Rome. Designs on vases, sarcophagi, and other works of antiquity exist adorned with representations of the same subjects as Z. painted, and probably were imitated from his productions.

ZEYST, a large village in the Netherlands, province of Utrecht, is surrounded by beautiful well-wooded estates and country-seats, the summer residences of many of the first families of Amsterdam. The industries are making soap, candles, and vinegar, brass and zinc founding, &c. On a rising ground, and surrounded by fine old trees, stands the Dutch Reformed church, built in 1180. There is also a Roman Catholic church. In 1746, a society of Moravian Brethren settled at Z., where they have built a separate quarter, consisting of public and private buildings, erected along the sides of two large grassy squares, called the Easter Plain and the Wester. Besides the church, there is an excellent day and boarding-school, which is resorted to by children of parents belonging to various Protestant communions. The unmarried members live, the males in the Brothers' House, the females in the Sisters' House. Another building is set apart for widows. There are also family residences, workshops, and warehouses. In 1866, the pop. of Z. numbered 5256.

ZIERIKZEE, an old and important town in the Netherlands, province of Zeeland, is situated in the south-east of the island of Schouwen. It was fortified before the beginning of the 11th c., and owed its rise and prosperity to the shipping-trade and fishing. The walls have been levelled, planted with trees, and formed into shady walks. Z. has two havens, the old and the new, two Dutch Reformed churches, a Lutheran, a Roman Catholic, a small dissenting church, and a Jewish synagogue. There are a grammar-school, school of design, and other excellent public schools maintained by the town. The principal means of living are trade in agricultural produce, shipping, ship-building, fishing, weaving calicos, beer-brewing, drying madder, sawing wood, grinding corn, &c.

Z. suffered severely in the contests between Flanders and Holland for the possession of Zeeland. In 1303, the Flemings besieged it with a large army, but were compelled, by Count William of Holland, to retire, on the 10th of August 1304. In the long war of independence, after an obstinate defence, the Spaniards took Z. on the 2d of July 1576. Pop. (1866) 7844.

ZIGZAG, in Military Science, a trench of approach against a fortress; so constructed that the line of trench may not be enfiladed by the defenders. See SINGE.

ZIGZAG, a decoration characteristic of the Norman style of architecture. It consists of one or more mouldings running in zigzag lines, and is used with great effect. The zigzags are employed in great profusion, and are sometimes undercut so as to be detached from the mouldings.

ZILLEH (ancient *Zela*), a town in Asiatic Turkey, in the pashalic of Sivas, about 30 miles west-south-west of Tokat. It is built on a height, with a small flat conical hill in the centre of the town, which is evidently the mound or road, of which another portion is still seen at Thyana, the construction of which was attributed to Semiramis. Scarcely any remains of antiquity are to be found here; an ugly fortress of the middle ages having usurped the place of its beautiful temple. This was the field of Julius Cæsar's battle with Pharnaces, of which he wrote 'Veni, vidi, vici.' There are several large, khans, and manufactures of coarse cottons. Its annual fair, of 15 or 20 days, from the middle of November, is often frequented by 40,000 or 50,000 persons from the commercial towns of Asiatic Turkey. There are about 2000 houses, the population being almost entirely Turkish.

ZILLERTHAL, one of the principal valleys in the Tyrol, traversed by the Ziller, is about 50 miles long. Towards the south and south-west, it is bounded by lofty glaciers; but towards the north, where it opens into the valley of the Inn, it is tolerably fertile. Among the eight secondary valleys are the Duxerthal—famous for its precipitous glaciers, 1200 feet high—and the Zemthal, both remarkable for several great waterfalls. The inhabitants of the Z., who number about 14,000, are celebrated even in the Tyrol for their handsome, well-built figures; and their fine Alpine songs are well known and appreciated in London and Paris. The chief wealth of the Z. is derived from the rearing of cattle. About 5000 head of cattle are exported yearly; but, notwithstanding, the valley is not able to support its numerous population. Many of the men hire themselves out as servants for the summer, while others go about as pedlars, selling essences of herbs and gloves, of which 10,000 pair are made yearly. The principal town is Zell. For some years, the valley has been much visited by artists, chiefly from Munich.

In recent times, the inhabitants of Z. acquired considerable notoriety by a part of them leaving the Roman Catholic Church, and emigrating. For a considerable time, they had been in the habit of reading the Bible, and were on friendly terms with the Protestant Church, although still attending the Roman Catholic service; but when, in 1826, the Catholic clergy began to enforce auricular confession with greater strictness, a number of them thought seriously of going over to the Protestant Church. Ere long, they not only objected to the confessional, but to the worship of the saints, absolutions, masses for the soul, purgatory, &c. In 1830, they began to leave the church; and by 1832, the number of dissenters had amounted to 240. The Emperor Francis, to whom, on his visit to Innsbrück in 1832, they addressed a petition regarding their religion, promised them toleration; but after considerable delay, they were told (1834) that they must either return to the Catholic faith or remove to Transylvania, where there were Protestant congregations. As the Zillerthalers could not agree to this, they formed the resolution, as the Protestants of Salzburg had once done, of seeking a refuge in Prussia. This was granted; and the Zillerthalers, who had been allowed by the Austrian government to sell their property, set out, August 1837, for Prussia. In all, 399 men, women, and children arrived, 2d October, at Sohmedeberg, in Silesia, where they were to stay until the arrangements for their reception in Ermannsdorf were completed. The king gave them 22,500 thalers (£3375) on their settlement, and (1839) made them a further grant of 12,500 thalers (£1875) for a church and school. The colony

received the name of Z., and is divided into Upper, Middle, and Lower Zillerthal.—See *Geschichte der Zillerthaler Protestanten* (Nürnb. 1838); Rheinwald, *Die Evangelischgesinnten im Zillerthal* (4 Aufl., Berl. 1838).

ZIMB, a dipterous insect, exceedingly destructive to cattle in Abyssinia, as the Tsetse (q. v.) is in more southern parts of Africa. It probably belongs to the same family, but this has not yet been ascertained. It is supposed to be the *Zebub* of the Hebrew Scriptures (Is. vii. 18). Bruce describes it as very little larger than a bee, but thicker in proportion; the wings broader, and without colour or spot; the head large; the upper lip sharp, having at the end of it a strong pointed hair, a quarter of an inch long; the lower lip with two similar bristles. The flight of the insect re-

Zimb.

sembles that of the gadfly, and is attended with a peculiar buzzing. The Z. is found only where the soil consists of a rich black loam; but all the inhabitants of the sea-coast, along the southern shores of the Red Sea, and southwards beyond Cape Guardafui, are compelled to remove their cattle in the rainy season to the nearest sands, in order to prevent their destruction by this pest, as well as those of more inland districts from the mountains of Abyssinia northwards to the confluence of the Astaboras and the Nile. 'As soon as this plague appears, and their buzzing is heard,' Bruce says, 'all the cattle forsake their food, and run wildly about the plain till they die, worn out with fatigue, fright, and hunger.' The camel, the elephant, and the rhinoceros are liable to the attacks of the Z., as well as the ox; but the elephant and rhinoceros protect themselves by rolling in mud, which, when dry, coats them as a kind of armour.

ZIMMERMAN, JOHANN GEORG, a native of the town of Brugg, in the Swiss canton of Bern, in which his father was a senator, was born on the 8th December 1728. He was educated at home, in the first instance, and afterwards at Bern, preparatory to his going to the university of Göttingen to study medicine. This he did in the year 1747. By his countryman, the celebrated Haller, he was kindly welcomed; he became an inmate of his house, and had the advantage of his valuable aid in the prosecution of his studies. In these he displayed the utmost ardour, not content to confine himself to medicine, but aiming at a large and liberal culture. In his specialty, so great was the proficiency attained, that on his taking his degree of Doctor in 1751, he published a work entitled *Dissertatio Physiologica de Irritabilitate*, which not only at the time attracted attention by its originality of view, but even now is held to be not without value. In 1752, he began to practise as a physician at Bern with every prospect of success; but shortly after, the post of public physician falling vacant in Brugg, his native place, he was induced to transfer himself thither. About this time, he was married to a relation of his friend and preceptor, Haller. Despite the extensive practice he speedily acquired, with such a reputation for skill as brought patients from a great distance to consult him, he continued to cultivate other pursuits; and in 1756, he published a miscellany of prose and verse, remarkable as containing the first sketch of

his treatise *On Solitude*, which afterwards became so famous. In 1758 appeared his work on *National Pride*, an ingenious and able dissertation, which immediately became popular, and carried the name of the writer, by translation, into nearly every country in Europe. That he did not, however, neglect his special department of study was proved in 1763 by the appearance of an elaborate work on *Experience in Medicine (Von der Erfahrung in der Arzneikunst; Zürich, 2 vols. 8vo)*. Of this, the great value was instantly recognised, and it still continues to enjoy some portion of its first reputation. Z. was now a man of European note; and among other advantageous offers made to him was that of the post of Physician to the king of Britain at Hanover, with the title of Aulic Councillor attached to it. This he accepted; and to Hanover he accordingly went in 1768. His repute as a physician continued here to increase, and from all quarters came flocks of people to have the benefit of his advice. In 1770, he had the misfortune to lose his wife; and this distress was complicated by an attack of an internal malady, which soon after obliged him to go to Berlin to undergo a perilous operation. This was successfully performed, but did not preclude a return of the complaint some time after. His only daughter now died; and a son who survived sunk under the influence of disease into something like entire idiocy. Z., who had almost from his very boyhood had to struggle against a constitutional melancholy, became now, as it almost seemed, a confirmed and hopeless hypochondriac. From this deplorable state he was rescued for a time by a second marriage, into which his friends persuaded him; and as fruit of his revived interest in life, he gave to the world, in 1784, his celebrated work *On Solitude (Ueber die Einsamkeit; Leipzig, 4 vols. 8vo)*, a book which speedily became a popular favourite throughout Europe. In 1786, he was invited by Frederick the Great, then in his last illness, to attend him at Potsdam. On going thither, he found that the case of the king was beyond the reach of his art. He remained, however, for some time; and as the result of his sojourn, he published in 1788 and 1790, two works on Frederick the Great, the manifold indiscretions contained in which involved him in much painful and acrimonious controversy. In excuse of much in the books not easily to be defended, everything seems to shew that they were merely the first indications of a return of his constitutional malady in an aggravated, and, as it proved, a finally intractable and hopeless form. His melancholy hallucinations continued to grow upon him, till he was at length little better than a mere maniac; and on the 7th of October 1795, he died at Hanover. During these last sad years, he had continued at intervals to write and publish; but in everything thus produced there was evident the wreck of his once brilliant faculties. As a physician, a philosopher, a man of general accomplishment, and a writer of singular power and felicity, Z. was unquestionably one of the most remarkable figures of his time. Of Zimmerman on *Solitude* every one must needs have heard: it no longer retains the immense popularity it once had; but along with his more expressly medical treatises, which are of interest—if not very much now otherwise—in relation to the history and development of his profession, it must still continue for a time to perpetuate the name of its writer.—See *Z.'s Eigene Lebensbeschreibung* (Autobiography, Han. 1791); Tissot, *Vie de Z.* (Lausanne, 1797); Wichmann, *Z.'s Krankengeschichte* (Han. 1786).

ZINC (symb. Zn, equiv. 32.5, spec. grav. 6.8), or *Spelter*, as it is often called in commerce, is a hard bluish-white metal, lustrous externally, and when

broken, exhibits a foliaceous crystalline fracture. At ordinary temperatures, it is somewhat brittle; but when heated to above 212°, it becomes perfectly ductile and malleable, and may be drawn out into wire or beaten into thin plates. At about 400°, it again becomes so brittle that it may be easily pulverised. It fuses at 773°, and at a white heat may be volatilised; and if the vapour be exposed to the air, it burns very brilliantly, and is converted into oxide of zinc, which is deposited in copious white flakes. The temperature of its boiling-point is estimated by Deville at 1904°. On exposure to the air, zinc soon loses its metallic lustre, and assumes a gray appearance, in consequence of its surface becoming oxidised, while the metal beneath is thus protected from further change—a property which renders this metal especially useful for many economical purposes. It has no action on water at ordinary temperatures, but if a mineral acid be present, it readily decomposes water, and is employed to decompose the water of dilute sulphuric acid, when hydrogen is required. Moreover, a hot solution of potash acts on zinc, hydrogen being liberated, while oxide of zinc is formed and dissolved in the alkaline solution. Zinc precipitates from their solutions most of the electro-positive or basylous metals less oxidisable than itself.

This metal is never found in the native state; the chief ores from which it is extracted are noticed below.

The commercial zinc obtained by the ordinary methods of extraction usually contains a small quantity of lead, iron, and carbon, with occasional traces of arsenic and copper. In order to obtain it in a chemically pure state, a stream of sulphuretted hydrogen is passed through a slightly acidulated solution of sulphate of zinc, and after the removal of any precipitate that may be found, the solution is boiled so as to expel the gas, after which the zinc is precipitated in the form of carbonate, by the addition of carbonate of soda. The carbonate is converted by ignition into oxide of zinc, which must be distilled in a porcelain retort with the purest available form of carbon, as, for example, charcoal prepared from loaf-sugar.

Zinc is commonly regarded as forming only one compound with oxygen—namely, the *protoxide of zinc* (ZnO), although it has been suggested that the film which is formed upon the surface of metallic zinc by exposure is a sub-oxide. Protoxide of zinc is obtained by heating the metal in the air, the white oxide thus obtained being formerly known as *Lana philosophica*, from its woolly appearance; while it was known as *Flores zinci*, or *Flowers of Zinc*, in pharmacy. The process of manufacturing this oxide, when it is required as a pigment, consists, as Professor Miller remarks, 'in distilling zinc from clay retorts into chambers through which a current of air is maintained. The volatilised metal burns at the high temperature to which it is exposed under these circumstances; and the oxide is deposited in a series of condensing chambers.'—*Inorganic Chemistry*, 3d ed. p. 545. The pigment thus obtained is known as *Zinc White*. The impure oxide of zinc, commonly known as *Tutty*, is obtained from the flues of furnaces in which brass is melted. A hydrated oxide of zinc (Zn₂H₂O) is precipitated in a white gelatinous mass from the solution of the salts of zinc by the addition of potash or soda, but redissolves in an excess of the alkali. Oxide of zinc is readily soluble in acids, and is capable of being reduced by charcoal, but not by hydrogen. The most important salts formed by oxide of zinc are the sulphate and carbonate. *Sulphate of Zinc*, or *White Vitriol* (ZnO.S₂O₇ + 7Aq), occurs in large transparent, glistening, four-sided

prismatic crystals, resembling those of Epsom salts. At a temperature a little below 212°, the crystals lose six equivalents of their water of crystallisation, and at a somewhat greater heat, they lose their last equivalent, and previously to losing their water of crystallisation, they fuse in it. This salt is readily soluble in water, requiring 2½ parts of the latter for its solution at 60°. It is obtained in considerable quantity as a residue in the process of obtaining hydrogen from dilute sulphuric acid and zinc; and it is prepared on the large scale by roasting and lixiviating zinc-blende or sulphide of zinc, which, when heated in the presence of air, is oxidised into the sulphate. *Carbonate of Zinc* (ZnO, CO_2) constitutes one of the most important of the zinc-ores—viz., the common or rhomboidal variety of *calamine*, a name which is derived from the property which this substance possesses of adhering after fusion in the form of reeds to the base of the furnace. Carbonate of zinc may be artificially prepared by precipitating a salt of oxide of zinc with carbonate of soda, when the required salt falls as a white precipitate; this is, however, not simple neutral carbonate, but a basic carbonate, having the composition expressed by the formula $2(\text{ZnO}, \text{CO}_2)$, $3(\text{ZnO}, \text{HO})$. Of the haloid salts, the *Chloride of Zinc* (ZnCl), formerly known as *Butter of Zinc*, is the only one requiring notice. This salt is obtained in the anhydrous form by burning zinc in chlorine gas, and in the hydrated state by dissolving zinc in hydrochloric acid, and evaporating the solution, chloride of zinc being thus formed, while hydrogen escapes in the gaseous form. In the anhydrous state, it forms a whitish-gray, semi-transparent mass, which fuses readily, and sublimes at a high temperature. When exposed to the air, it soon deliquesces, and is soluble in water in all proportions. The watery solution has a burning and nauseous taste, and in a concentrated state acts as a powerful caustic. It may be crystallised with 1 equivalent of water from its aqueous solution; and it is soluble in alcohol. It forms double salts with the chlorides of sodium, potassium, and ammonium; and a concentrated solution of the double chloride of zinc and ammonium ($\text{H}_4\text{NCl} + \text{ZnCl}$) is much used for the purpose of removing the film of oxide from the surface of metals, such as zinc, iron, or copper, which are to be united by the operation of soldering.—Miller's *Inorganic Chemistry*, 3d ed. p. 546. With sulphur, zinc forms only one combination—viz., *sulphide of zinc*, or *blende* (ZnS), which is one of the most abundant of the zinc minerals. Blende, when pure, is of a pale brown colour, but it is commonly blackish from admixture with sulphide of iron. It usually occurs crystallised in rhombic dodecahedra, or allied forms, but sometimes is found in the massive state. Sulphide of zinc may be obtained artificially as a white precipitate, which, on drying, becomes yellow, by the addition of sulphide of ammonium to a solution of a zinc-salt. Zinc forms several important alloys, amongst which *brass* (consisting of 2 parts of copper to 1 of zinc) and *German Silver* (q. v.) may be specially noticed. Professor Miller sums up the characters of the salts of zinc as follows: 'The salts of zinc are colourless; their solutions have an astringent, metallic taste, and act rapidly as emetics. They are distinguished by giving no precipitate in acid solutions with *sulphuretted hydrogen*, but they yield a white hydrated sulphide of zinc with sulphide of ammonium.'

Manufacture.—That the Romans were acquainted with the art of making brass—an alloy of copper and zinc—is proved by the analysis of some of their coins struck soon after the commencement of the Christian era. Yet zinc itself was not known in Europe as a distinct metal until Para-

celsus described its distinctive properties in the 16th century. Probably the Roman brass was produced by smelting ores containing both zinc and copper, some of which are at the present day smelted in Sweden. Zinc, however, was brought from the East by the Portuguese long before it became an article of commerce in Europe, and is supposed to have been known and made into articles of use and ornament both in India and China from an early period.

There are several ores of zinc, but only two of much importance—viz., blende and calamine. Blende, black-jack, or sulphuret of zinc, contains, when pure, about 67 per cent. of zinc, but, like most ores, it is rarely found pure. The usual composition of English blende is zinc 61, iron 4, and sulphur 33. It occurs in all the older geological formations, and is often associated with the ores of copper and tin, but most frequently with lead ore—occurring, of course, like these in veins. Blende crystallises in the form of the rhomboidal dodecahedron. The crystals have considerable brilliancy, but their lustre is waxy rather than metallic. In this country, it is usually of a dark colour, from the sulphuret of iron which it contains—hence the miners' name of *black-jack*. Sometimes it is sufficiently argentiferous to allow of the profitable extraction of the silver. Blende is found in Wales, Isle of Man, Cornwall, and Derbyshire. It is also found in a good many localities on the continent—Sweden, in particular, being rich in this ore.

Calamine, or carbonate of zinc, contains, when pure, 52 per cent. of zinc, but it varies much in the proportion of metal which it contains on account of impurities. Its primitive crystalline form is the rhombohedron, but calamine as well as blende occurs more frequently massive than in crystals. It is usually either of a dull yellow or reddish-brown colour. Like some other useful substances, calamine was formerly exported from England as ballast, through ignorance of its value. It was at one time raised to a considerable extent in Somersetshire, Derbyshire, and Cumberland, but it is chiefly the last county which produces it now. Belgium, Silesia, and Carinthia are well-known continental localities; and quite recently, most extensive deposits of it have been discovered on the north coast of Spain, which are estimated to last for ages.

Red oxide of zinc is found in New Jersey, U. S., where it is smelted. This is an oxide of zinc with a small quantity of oxide of manganese, which gives it its red colour. Silicate of zinc, or electric calamine, is another rare ore, generally associated when found with calamine. It is said to be smelted in the United States, and to yield very pure zinc.

There are several distinct processes for the extraction of zinc from its ores, and of these the English, the Belgian, and the Silesian are the most important. The English process is as follows: The zinc ore (blende or calamine) is crushed between rollers to the size of hazel-nuts, and then roasted for about twelve hours, with occasional stirring, in a calcining furnace. The furnace in which the roasted ore is reduced very much resembles a glass-furnace. It is either circular or octagonal in form, and usually contains six pots or crucibles, made of Stourbridge fireclay, about 3 feet high by 2½ feet in their widest diameter. In the bottom of each pot there is an opening, from which a sheet-iron tube, in two pieces, descends about 8 feet, and under its open end there is a sheet-iron vessel to receive the condensed zinc. Fig. 1 gives a sectional view of this furnace, and fig. 2 a view of one of the pots with its appendages on a larger scale. Zinc being volatile at high temperatures, is smelted by distillation, and in the English

process it is called distillation *per descensum*. An entire charge—that is, a charge for the whole six

Fig. 1.

pots (a)—consists of one ton of calcined ore mixed with a proper quantity of ground coke. When the pots are charged, their covers are fixed and luted on, the conical portion of the descending pipe (b) being previously securely fixed and lined with fireclay. The hole in the bottom of the pot is plugged with wood, which becomes converted into charcoal by the heat, and is then sufficiently porous to allow the zinc vapour to pass down, while at the same time it stops the descent of the coke or ore. The heat of the furnace is gradually raised, and soon produces

Fig. 2.

vapour of zinc in the pots, which condenses as it descends the pipes (c), and drops into trays (d) placed at the bottom of each pipe. Sometimes a tube becomes stopped by a lump of zinc, and when this happens, the furnace-man melts it with a bar of red-hot iron. It takes nearly three days to work off the above charge, which yields about 8 cwts. of zinc, and requires about 25 tons of coals for its distillation. It is necessary to watch the pots with great care while the process

is going on, as any leakage usually causes much loss of zinc. The *rough zinc*, as it is called, is removed from the pans, where it accumulates in lumps, and melted in cast-iron pots. It is then well stirred and skimmed, and finally cast into ingots or cakes of the ordinary commercial size—the skimmings being worked over again with a new charge of ore.

The Belgian furnace differs greatly in its construction from the English. It consists of from 60 to 80 small fireclay retorts, *a, a, a*, each about 3 feet 6 inches long, by 8 inches in diameter, and set

in a series of rectangular compartments, filling up an arched chamber. Fig. 3 shews a transverse section of this furnace. There is a clay nozzle or condenser, *b, b, b*, attached to the front of each retort, and on the end of this nozzle there is a sheet-iron receiver, *c, c, c*, for the condensed zinc. The fireplace is shewn at *d*, and *e* is the pit to collect the residue from the retorts. The retorts are charged with ground and roasted calamine, mixed with small-coal free from sulphur. As the upper retorts receive less heat than the lower ones, they are not so heavily charged, and they are, moreover, supplied with less pure ore. At the end of every six hours, the receivers are emptied of their melted zinc. In this process, a ton of ore can be smelted in 24 hours, and the yield from it is about 40 per cent. of metallic zinc.

In the Silesian furnace, fireclay retorts, about 4 feet long by 1 foot 6 inches in diameter, are arranged in two rows, back to back, and placed horizontally on a flat furnace-bed, with a fireplace on a lower level running along between the backs of the retorts. A condensing apparatus comes away with a curve from the upper part of the front of each retort, and descends some 2 feet below it. From this, the zinc, on condensing, drops on the ground, or into a tray placed to receive it.

With regard to the comparative merits of these three processes of smelting zinc, no very decided opinion appears to be yet arrived at by those who have the best means of judging. The Belgian process consumes the least fuel, but requires the greatest amount of labour; the English, on the

Fig. 3.

other hand, is worked with the least amount of labour, but requires the most fuel; whilst the Silesian holds a sort of middle position between those extremes. Each, however, has minor advantages and disadvantages which the others have not. All three processes are in use in England.

Zinc, at ordinary temperatures, is a comparatively brittle metal; but about the beginning of the present century, it was discovered that, if heated to between 200° and 300° F., its malleability and ductility were so increased that it could be rolled with facility into thin sheets, or drawn into fine wire. Since this was known, the uses of the metal, which formerly was only employed along with copper to make brass, have become greatly extended. In sheets, it is used for roofing, baths, water-tanks, spouting, and the like; also for covering ships' bottoms instead of copper. A considerable quantity is consumed for name-plates, for engraving upon, and for galvanic batteries. Perforated sheets with various ornamental patterns are manufactured for screens, blinds, light fences, and similar objects. As a material for casting artistic works, zinc possesses the desirable properties of having a low melting-point, and of taking a sharp impression from the mould, so as to require but little labour from the chaser; it has also considerable hardness. It has, in consequence, become a favourite material on the continent for making casts of statues, statuettes, and different kinds of ornaments.

Of late years, zinc has been applied with great success to the coating of sheet-iron for roofing and other purposes, and also for coating various kinds of iron wire, especially telegraphic wire. See GALVANISED IRON.

We may remark here, that when zinc is exposed to a moist atmosphere, its surface becomes coated with a thin compact film of oxide or rust, which protects the metal beneath from further oxidation, whereas the rust of iron appears rather to penetrate the body of the metal with greater ease when it has once begun. Hence the value of zinc as a material for roofing, and also for protecting the surface of iron roofs.

The average annual produce of the zinc mines of the United Kingdom, for several years past, may be taken, in round numbers, at 15,000 tons of ore, yielding about 4000 tons of zinc, of the value of from £80,000 to £100,000, according to the market price of the metal, which has varied considerably. Our imports, in like manner, have amounted to about 30,000 tons annually of metallic zinc, the greater part of which came from Prussia, Belgium, and Holland.

Oxide of zinc is now employed to a large extent as a white pigment. It is of a purer colour than white lead, does not tarnish and blacken like it with sulphuretted hydrogen, and is much healthier for operative painters, but unfortunately it is deficient in body. It is also used as an ingredient in pottery colours. An impure sulphate of zinc, known as *white vitriol*, is also employed in various arts.

Medical Uses.—In its purely metallic state, zinc produces no effect upon the animal economy, but several of its compounds are very active medicines. As a matter of convenience, we shall consider these compounds alphabetically, beginning with *acetate of zinc*, a salt not considered in the article on the chemistry of this metal. It is obtained by dissolving, with the aid of heat, carbonate of zinc in a mixture of acetic acid and distilled water, filtering the liquid while still hot, and setting it aside to crystallise. In this process, the carbonic acid of the carbonate of zinc is displaced by the acetic acid, and escapes with effervescence. The salt is obtained in thin, translucent, and colourless crystalline plates of a pearly lustre, with a sharp unpleasant taste, soluble in water, from which it may be precipitated, pure white, by sulphuretted hydrogen, and evolves acetic acid when decomposed by sulphuric acid. The crystals contain 3 equivalents of water, and their composition is

represented by the formula, $ZnO, C_2H_3O_2 + 3Aq$. Acetate of zinc is not much employed internally, but it is one of the most valuable local astringents, and is especially useful (in the form of solution of from 3 to 5 grains in an ounce of water) in the treatment of skin-diseases attended with much discharge, such as eczema, impetigo, &c., when the first inflammatory symptoms have subsided; and it forms a useful astringent in the milder form of ophthalmia. It was the active ingredient in Sir Astley Cooper's celebrated injection for gonorrhoea in the third week—six grains of sulphate of zinc mixed with four fluid ounces of dilute solution of subacetate of lead, when sulphate of lead is precipitated, and acetate of zinc is held in solution. When employed as an ointment in skin diseases, from 4 to 10 grains finely powdered may be rubbed up with cold cream or simple ointment. *Carbonate of Zinc* is obtained for pharmaceutical purposes by the decomposition of sulphate of zinc in solution and carbonate of soda, when the carbonate of zinc is precipitated as a white, tasteless, inodorous powder, insoluble in water, but soluble with effervescence and without residue in dilute sulphuric acid. This preparation has been introduced as a substitute for *native calamine*, which formerly had a high reputation, but was so frequently adulterated as to render an officinal salt of known composition very desirable. Either in powder, or in the form of ointment, it forms an excellent astringent application for the treatment of intertrigo (or chafing of the skin), excoriations, and chronic skin diseases attended with much discharge. *Turner's Cerate*, although not in the Pharmacopœia, is in general use as a drying and healing ointment, and is one of the most popular remedies for superficial burns and sores. It is made by taking prepared calamine (or carbonate of zinc) and wax, $7\frac{1}{2}$ ounces of each, and olive oil 1 pint. Melt the wax, and mix the oil with it, then remove them from the fire, and when the mixture begins to thicken, add the calamine, and stir constantly till they cool. *Chloride of Zinc*, in the form of colourless opaque rods, obtained by pouring the concentrated solution into proper moulds, is used in surgery as a powerful caustic in cases of cancer, fungous growths, &c. In toothache caused by caries, a minute portion of chloride of zinc introduced into the cavity of the tooth after the removal of the diseased parts, affords almost immediate relief. In consequence of its powerfully destructive properties, it should never be applied except by the surgeon. The solution of this salt, commonly known as *Burnett's Disinfectant Fluid*, is of much use in the sick-room or hospital ward as a deodorising agent; as, however, it possesses strong caustic properties, great care must be taken that it is not administered internally in mistake for some other medicine. Few years pass without several fatal cases of this kind being recorded. *Oxide of Zinc* is characterised in the Pharmacopœia as 'a soft, white, tasteless, and inodorous powder, becoming pale yellow when heated, and forming with diluted sulphuric acid a solution which gives a white precipitate with hydrosulphide of ammonia.' It is employed internally with much success as a tonic in chorea and epilepsy, in which it must be given for a considerable period, and in gradually increasing doses till a scruple is taken daily. In doses of one or two grains combined with extract of henbane, it forms an admirable night-pill to check the perspiration in pulmonary consumption. Employed externally, either in the form of powder or ointment it forms a good astringent in cases of excoriation, sore nipples, intertrigo, slight ulcerations, &c. The officinal ointment containing 80 grains to an ounce of simple ointment, is too strong for ordinary cases,

and is apt to *cake* upon the surface: these defects may, however, be removed by the addition of glycerine. *Sulphate of Zinc* is employed as an astringent, a caustic, an emetic, and a tonic. As an astringent, it is given internally in small doses (of from half a grain to two grains, made into a pill with conserve of roses), in cases of chronic diarrhoea, chronic bronchitis, and long-standing leucorrhœa; while it is used topically as a lotion in old ulcers (from 5 to 20 grains to an ounce of water), as a collyrium in chronic ophthalmia, and as an injection in the abortive treatment of gonorrhœa (i. e., when we wish to cut short the disease before inflammatory symptoms appear). As a caustic, this salt, in its anhydrous state, and finely levigated, has been strongly recommended by Sir James Simpson. He applies it in the form of powder; of a paste made with glycerine in the proportion of a drachm of the latter to an ounce of the powder; or of an ointment consisting of two drachms of prepared lard, rubbed up with an ounce of the powder. It has also been successfully used in the Dublin hospitals. Sulphate of zinc may be given in the same doses as the oxide as a tonic in cases of nervous palsy, and in the exhaustion dependent upon sexual excesses. In large doses, as from 15 to 30 grains, it operates as a safe and speedy emetic, and is preferable to all other emetics in cases of poisoning. In toxicological researches—as in *Marsh's Test for Arsenic*—great care must be taken to see that the zinc which is employed is perfectly free from arsenic, which is a not uncommon impurity.

ZINCOGRAPHY is essentially the same art as Lithography (q. v.), zinc-plates being substituted for those of stone. One form of the art is described under the name of Anastatic Printing (see PRINTING). A style of it, called Pencilography, brought forward by Gillot of Paris for the purpose of reproducing, by lithographic, autographic, or typographic proof, any drawing with crayon or stump, or any engraving from wood or copper, is thus described: A plate of zinc finely polished is prepared, and if an original drawing is to be copied, it is done by the artist in lithographic crayon on this plate; autographic writing done with the crayon, lithographs, and fresh proofs of wood or copper-plate engravings, must be transferred in the usual way to the surface of the plate; and whilst still wet, an ink-roller is passed over, so as to give a deeper impression. Rosin very finely powdered is then sifted over, which adheres to the wet ink, and becomes consolidated, so that the superfluous powder is easily brushed off from the parts not covered with ink. The plate is next placed with its face upwards in a shallow trough containing dilute sulphuric or hydrochloric acid sufficient to slightly cover it; the trough is then gently rocked, so as to make the acid flow backwards and forwards over the plate, and if this be continued for some time—an hour or upwards—all the parts of the plate not covered with the ink and rosin are etched deep enough to be used as a relief-plate for printing from. In impressions where there are large interspaces, it is usual to saw them out; and in some cases, where it is found that the relief is not sufficiently high, the raised parts are re-inked, and again covered with the rosin, and submitted a second time to the action of the acid. Old engravings may be transferred by laying them to become damp on a board wetted with acidulated water, and then applying the ink-roller to the face of the engraving; the ink only acts upon the ink-lines of the engraving, and is repelled by the acid moisture which has been imbibed by the uncovered white spaces. A slight pressure will then easily produce a copy on the polished zinc-plate, which is perfected by the subsequent operations.

ZINGEL (*Aspro*), a genus of fishes of the perch family, remarkable for the elongated form of the body, and for having the mouth situated under the projecting and rounded snout, also for the roughness of their scales. The dorsal fins are widely separated, and the ventral fins are large. Only two species are known: of which one, the Z. of the

Zingel (*Aspro vulgaris*).

Danube (*A. zingel*), inhabits that river and its tributaries, attains a length of fifteen inches, and a weight of two or three pounds; the other (*A. vulgaris*) is found in the Rhone and its tributaries, and also in more eastern rivers, although unknown in those of the west of France, and is only six or seven inches long. Both are esteemed for the table.

ZINGIBERA'CEÆ. See SCITAMINÆ.

ZINZENDORF, NICOLAUS LUDWIG, COUNT VON, the founder of the existing sect of the Moravian Brethren, or Herrnhuters, was born at Dresden, 26th May 1700. His father, a Saxon state minister, dying while Z. was a child, the latter was educated by his grandmother, a learned and pious lady, the Baroness von Gersdorf. Spener, the head of the Pietists, was a frequent visitor at her house, and his conversation, and the devotional exercises in which Z. took part, influenced his character while a mere child. In 1710, he went to Halle, where he spent six years, under the special care of Francke, the philanthropist. Z. founded among his fellow-pupils a religious society, to which he gave the name of the 'Order of the Grain of Mustard-seed.' In 1716, he was sent by his relatives to Wittenberg, where Pietism was in less repute than at Halle; but he adhered to his early religious impressions. Two years afterwards, he travelled through Holland and France, everywhere endeavouring to convert the distinguished persons whom he met to his own religious views. On his return to Dresden, he was appointed a member of the Saxon state council, and married the sister of the Count Reuss von Ebersdorf. But political life was little to his mind, and he returned to his country-seat in Upper Lusatia. While residing there, he accidentally met a wandering carpenter, named Christian David, a member of the old sect of Moravian Brethren, of whom some still remained in Moravia, professing the doctrines taught by John Huss. David described the persecutions to which the sect were exposed; and Z. invited him and his friends to settle on his estate. They accepted the proposal, and the colony received the name of 'Herrnhut.' Z. acted with great liberality to the settlers, and their success attracted much attention. In 1734, Z. went under a feigned name to Stralsund to pass an examination in theology, and was ordained a minister of the Lutheran Church. In 1738, he was banished from Saxony, on a charge of introducing dangerous novelties in religion. He repaired to Holland, where he founded a Moravian colony, and afterwards to Esthonia and Livonia, where he also founded colonies. In 1737, at the request of King Frederick-William I. of Prussia, he was ordained Bishop of the Moravians. In the same year, he went to London, where he was received with much consideration by Wesley. In 1741, he went to North America, accompanied by his daughter, and

founded the celebrated Moravian colony of Bethlehem. The Herrnhuters, in the meanwhile, by their good conduct and industry, had won the respect of all classes in Saxony, and in 1747, Z. was allowed to return to Herrnhut. Having received authority by act of parliament to establish Moravian settlements in the English colonies of North America, he returned thither to do so. He finally settled at Herrnhut; and his first wife being dead, married Anne Nitschmann, one of the earliest colonists from Moravia. He died on 9th May 1760. Thirty-two preachers, from all parts of the globe, accompanied the coffin to the grave. Z. was the author of more than 100 works in verse and prose. His hymns, used in worship by the Moravians, are objectionable on account of their pious indecency. The same may be said of his sermons, especially of those which refer to the Holy Ghost as a spiritual mother. His writings are often incoherent or mystical, but they abound with passages in which deep and original thought is expressed with great clearness and beauty.—A Life of Z. has been written by Varnhagen von Ense, published in his *Denkmale* (Berlin, 1830).

ZION. Mount Z. is the name of the hill on which the south-west part of Jerusalem, the City of David, or Upper City, with the citadel of David, stood. At the present day, only the north half belongs to the city, the city wall running obliquely over the hill. On the west, and still more on the south side, it descends steeply into the Vale of Hinnom, to a depth of 300 feet. Mount Z. is 2537 feet above the level of the Mediterranean Sea. With the prophets and poets of the Old Testament, Z. often stands for the whole of Jerusalem (also called 'Daughter of Zion'), particularly in reference to the Temple. See JERUSALEM.

ZIRCO'NIUM (symb. Zr, equiv. 33.6) is the metallic constituent of the earth *zirconia*, which is found in association with silica in the minerals *zircon* and *hyacinth*. The composition of zirconia is usually represented by the formula Zr_2O_3 , but Swanberg regards zirconia not as a pure earth, but as a mixture of three; and to one of the metals, whose earths he thinks that he has isolated, he gives the name of *Norium*. The sources from which zirconium is derived are so scarce (it being found only in Ceylon, one district of the Ural, and Southern Norway), that it is unnecessary to enter into any details regarding it.

ZIRKKNITZ, or CZIRKNITZ, LAKE (Ger. *Czirknitzsee*, *Lacus Lupeus* of Strabo), a small lake of Austria, in Carniola, about 20 miles south-south-west of Laibach, and 30 miles east-north-east of Trieste, is situated in a deep valley to the south of Mount Javornik, and to the north-east of Mount Slivnza. The lake is about 5 miles long, and between 2 and 3 broad, is surrounded with numerous villages, chapels, and castles, contains four small islands—on the largest of which is built the hamlet of Ottok—and has no surface outlet. It is about 56 feet deep in the deepest part, and is very irregular in shape. It is worthy of notice only on account of the very remarkable phenomenon of the occasional disappearance of its waters for several weeks, and even months, during which the bottom is often covered with luxuriant herbage, which the peasants make into hay; sometimes also they manage even to sow and reap a small crop of buckwheat in its deserted bed. The waters, however, are not perfectly regular in their disappearance—indeed, sometimes for five or six years together they have not retired at all—but generally they drain off in the end of August, and return, if the season be wet, in five or six weeks. It takes between 20 and 25 days to

empty the lake, but the return of the waters is sudden and unexpected, its basin being refilled sometimes in 24 hours. The phenomenon is accounted for by the nature of the bed of the lake. It is composed of limestone, and, like all the Carniolic plateau, is full of deep fissures and caverns, through which the waters disappear at irregular intervals, returning when the rain sets in. Some of these openings are 50 feet deep, and the chief ones are known to the peasantry by particular names. They communicate with subterranean reservoirs, penetrating the interior of the surrounding mountains, through which the waters are replenished or drawn off. There are 12 of these openings which discharge water into the lake as well as draw it off, and 28 which draw it off only. Through the former of these the water pours in after rainy weather as from a spout. When the surface of the lake reaches the caverns of Velka-Karlanza and Malka-Karlanza, the waters are discharged by these into the valley of St Canzian, and, after disappearing several times, fall into the Unz, above Planina. Sometimes, however, the volume of water is so great that these caverns prove insufficient to carry it off, when the lake overflows and covers the neighbouring country, sometimes submerging villages. In 1834, the lake was drained in January, and remained perfectly dry till the end of February 1835, a circumstance without parallel since the time that any records of its history have been kept. The lake is pretty well stocked with fish, and at certain times is the resort of great numbers of waterfowl, which afford both sport and profit.—There is a small village of the same name on a small stream that falls into the north side of the lake.

ZISKA,* or ZIZKA, JOHN, of Trocznov, the famous leader of the Hussites, was born at Trocznov, in the circle of Budweis, Bohemia, about 1360. His family being noble, he became a page to King Wenceslas of Bohemia, but his gloomy and thoughtful temperament unfitted him, while yet a mere boy, for the frivolous occupations about court; so, embracing the career of arms, he served as a volunteer in the English army in France, and afterwards joined King Ladislas of Poland with a body of Bohemian and Moravian auxiliaries, and greatly distinguished himself in the war against the Teutonic Knights, deciding the dreadful battle of Tannenberg (in which the Grand Master and 40,000 knights were left dead on the field) by desperate charges at the head of his contingent. High honours were heaped upon him by the king; but the war (in which Z. had lost his right eye) being now over, his restless spirit led him to join the Austrians against the Turks, and subsequently the English against the French; and returning to Bohemia soon after the murder of John Huss (q. v.), he became chamberlain to King Wenceslas. Z. was an adherent of the Hussite doctrine; and the tragical fate of its apostles, and the tyrannical cruelties exercised by the imperial and papal officers on its adherents, excited in his mind the liveliest indignation and resentment. A widespread sentiment of a similar kind, originating as much from patriotic as from religious feelings, existed in the kingdom; and a powerful party was soon formed, which urged upon the king a policy of resistance to the decisions of the Council of Constance. Z. soon became prominent among the leaders of this party, and his personal influence with the king gained for it the latter's sanction to offer

* It is often stated that John of Trocznov was called Z. on account of his being 'one-eyed,' but this is erroneous; Z. was the name of the family for generations before his time, nor does it signify 'one-eyed' in either the Bohemian or the Polish language.

resistance, though the king's vacillating disposition incapacitated him from giving effect to his own honest convictions, and taking open part with his subjects against their oppressors. After the outbreak at Prague (30th July 1419), in which the violent behaviour of the Catholics was avenged by the precipitation of 13 magistrates from the council windows, Z. was unanimously chosen leader of the Hussites, and the first great religious conflict of Germany was commenced in earnest. The shock produced by news of this outbreak was fatal to Wenceslas, and his death gave more of a political character to the contest, as when his brother, the Emperor Sigismund (the same who had allowed his safe-conduct to Huss to be violated), attempted, by advancing an army of 40,000 men into the country, to obtain the throne, his project was frustrated for a time by the Hussites, who insisted on their religious and political liberties being secured, and totally defeated his army with a hastily levied force of not more than 4000. On the retirement of the imperialists, Z. completed his conquest of Bohemia by the capture of the castle of Prague in 1421 (the town had been taken in the spring of 1420), and secured his hold of the country by the erection of fortresses, chief of which was that of Tabor, whence his party derived its name of *Taborites* (q. v.). The varied experience acquired by Z. in foreign warfare was now of immense service to his party; his followers were armed with small firearms (then little known); and his almost total deficiency in cavalry was compensated for by the introduction of the *Wagenburg* (or 'cart-fort,' constructed of the baggage-wagons), to protect his little army from the charges of the mail-clad knights. Numerous other inventions and ingenious contrivances mark Z.'s brief career as leader of the Hussites, and shew his eminent qualities as an engineer and a general. In 1421, he lost his remaining eye at the siege of the castle of Rabi; but though now totally blind, he continued to lead on his troops to a succession of victories almost unexampled in history—the list of 13 pitched battles fought by him, always with much inferior force, including only one defeat, and that so much resembling a drawn battle, that his opponents dared not molest his retreat. His greatest achievements were the rout (18th January 1422) of Sigismund's second invading army, which was driven into Moravia, and 2000 men of it drowned in attempting to escape across the frozen Iglau; and his great victory at Aussig, over the German crusading army, commanded by Frederick the Warlike of Saxony, and the Elector of Brandenburg. In the latter conflict, the furious onset of Z.'s troops was steadily sustained by the Saxons, who were choice troops, and the fanatic Hussites recoiled in astonishment at a successful resistance which they had never before encountered. Z., apprised of the circumstances, approached on his cart, thanked his men for their past services, adding, 'and if you have now done your utmost, let us retire.' Thus stimulated, they made a second charge still more furious than before, broke the Saxon array, and left 9000 of it dead on the field. Sigismund was now convinced that the conquest of Bohemia was impossible, and after a time proposed an arrangement with the Hussites, by which full religious liberty was allowed; and Z., who had an interview with the emperor on the footing of an independent chief, was to be appointed governor of Bohemia and her dependencies. But the war-worn old chief did not live long enough to complete the treaty, for, while besieging the castle of Frábislav, he was seized with the plague, and died, 12th October 1424. He was buried in a church at Čáslav, and his iron war-club was hung up over his tomb. A foolish story was long current that, in

accordance with Z.'s express injunctions, his skin was flayed off, tanned, and used as a cover for a drum, which was afterwards employed in the Hussite army; in order that even when dead he might be a terror to his enemies.

The only accusation which can with justice be made against Z. is on the ground of excessive cruelty, the victims being the monks and priests who fell into his hands. It would have been extremely curious if Z. had not laid himself open to such a reproach, for the burning alive of the propagators of the faith to which he adhered, the atrocious cruelties practised on such Hussite priests as fell into the hands of the imperialists, and the seduction of his own favourite sister by a monk, were events ill calculated to induce him to moderate the hatred entertained by himself and his followers against their opponents. The war was carried on mercilessly by both parties, and it was unreasonable to expect that the party assailed, and the one numerically weaker, should first set an example of moderation.

ZITTAU, a town of Saxony, 48 miles east-south-east of Dresden, and 69 by railway, is situated near the Bohemian frontier, close to the junction of the Neisse and Mandau. The town is well built, and is surrounded by a double wall; has many churches, the most notable of which is the Byzantine Church of St John, finished in 1836; a splendid court-house, one of the finest in Saxony, erected 1844; a good library of 12,000 vols.; a gymnasium, a normal, a free, an industrial, a Catholic, an infant, and other schools; several charitable institutions—as a work-house, infirmary, asylum for orphans, &c. Z. is the centre of the linen and damask manufacture of Saxony. There are also woollen manufactures, bleachfields, dye-works, paper, oil, and saw mills, and iron-foundries. From its proximity to the Bohemian frontier, it enjoys a considerable trade with that country. Pop. (1864) 14,290.

ZLATOU'ST, or **KLIUCHI** (Golden Mouth), a town of Russia, in the government of Orenberg, among the Ural Mountains, about 150 miles north-east of Ufa, on the river Ufa. It consists chiefly of wooden houses, and the inhabitants are mostly miners. It is the centre of the iron and gold mines of the district. There is an extensive manufactory of sword-blades, which are considered the best in the empire; other articles of inlaid and embossed steel are also manufactured. Pop. 15,000.

ZMEINOGO'RSK, or **ZMIEF**, a town of Siberia, in a mountainous district of the government of Tomsk, upwards of 350 miles south-west of the town of Tomsk, on the river Smievka. The town is situated in the vicinity of one of the most productive silver-mines in Siberia, which was discovered in 1736, and belonged to the Demidoff family till 1745, when it became crown property. Since its discovery, it has yielded nearly the half of the whole quantity of silver produced by the Siberian mines. Pop. 5990.

ZOAR, a village in Ohio, U. S., on the Ohio Canal, 111 miles north-east of Columbus, settled in 1818, by a German community, who hold in common 9000 acres of land; they have also a woollen factory, several mills, a store, church, and schools, all managed by an agent and three trustees, elected by popular vote.

ZO'BO, a hybrid between the Yak (q. v.) and the common ox of India. It is not very unlike an English ox. It is common in the western parts of the Himalaya, and is valued as a beast of burden, as well as for its milk and its flesh.

ZO'CLE, or **SOCLE**, a square plain plinth under the base of a column.

ZODIAC (Gr. *sodiakos*, commonly derived from *zōon*, an animal), the name given by the ancients to an imaginary band extending round the celestial sphere, having as its mesial line the ecliptic or apparent path of the sun. It was fixed at about 16° in width, for the purpose of comprehending the paths of the sun and of the five planets (Mercury, Venus, Mars, Jupiter, and Saturn) which were then known; and as, of these planets, Mercury has by far the greatest inclination of orbit to the ecliptic, and the value of that element in his case is only 7° 0' 9", the width given to the zodiac was amply sufficient for the required purpose. But when the career of planetary discovery commenced in the beginning of the 19th c., the first three which were discovered (Ceres, Pallas, and Juno) at once destroyed the idea which had been long seated in men's minds, that no planets existed beyond the limits of the zodiac, by exhibiting orbits inclined to the ecliptic at no less angles than 10° 36½', 34° 42½', and 13° 3½'; and a large number since observed have been found to wander from 0° to 18° beyond the zodiac, from which circumstance they have, along with the three above mentioned, been denominated *ultra-zodiacal* planets. The stars in the zodiac were grouped into 12 constellations, to each of which 30° or ¼th of the whole circle, was assigned, though it often did not fill up that space, but was only situated in it; and this equitable division into *signs* was of great advantage in defining the positions of the sun and planets at any epoch.

The constellations, with the appropriate symbols of the corresponding signs, are as follow :

| | |
|---------------------------|------------------------------------|
| Aries (<i>Ram</i>) ♈ | Libra (<i>Balance</i>) ♎ |
| Taurus (<i>Bull</i>) ♉ | Scorpio (<i>Scorpion</i>) ♏ |
| Gemini (<i>Twins</i>) ♊ | Sagittarius (<i>Archer</i>) ♐ |
| Cancer (<i>Crab</i>) ♋ | Capricornus (<i>Goat</i>) ♑ |
| Leo (<i>Lion</i>) ♌ | Aquarius (<i>Water-bearer</i>) ♒ |
| Virgo (<i>Virgin</i>) ♍ | Pisces (<i>Fishes</i>) ♓ |

As one half of the ecliptic is to the north, and the other to the south of the equator, the line of intersection of their planes is a diameter of each, and the two points in which this line meets the celestial sphere are known as the equinoctial points. The comparative immobility, with respect to the ecliptic, of these points, suggested at once the employment of one or other of them as a point from which to reckon, and accordingly that point at which the sun crosses the equinoctial from south to north was fixed upon, and called the first point (or commencement) of Aries. After the sun had advanced eastward through this sign—i. e., 30° along the ecliptic—he entered the sign of Taurus, continuing his course onward through the others in the order in which they are given above, again crossing the equinoctial southwards at the point where he emerged from Virgo, and entered Libra. This was the case with the sun during the time of Hipparchus (q. v.), but though the equinoctial points move very slowly, yet they do so with great uniformity, and the westerly motion of 50" annually which they describe along the ecliptic, has at the present time separated the sign Aries from the constellation Aries, and caused the former to correspond almost to the constellation Pisces. This gradual retrogression of the signs through the constellations of the zodiac will continue till they accomplish, in about 25,868 years, a complete circuit; after which period the sign and constellation of Aries will coincide, as they did in the time of Hipparchus. Neither the zodiac nor its constellations are of much use now in astronomy, except as, like the other constellations, affording an easy though somewhat fantastic nomenclature for the stars, and a rude, but sometimes convenient mode of reference to their positions.

The porticos of the temples of Denderah and Esne in Egypt have representations of the zodiacal constellations, which are of great antiquity, and have formed a fruitful theme of discussion. M. Dupuis, in his *Origine des Cultes*, has, from a careful investigation of the position of these signs, and calculating precession at its usual rate, arrived at the conclusion that the earliest of them dates from 4000 B. C. This conclusion is controverted by M. Fourier, in his *Recherches sur les Sciences, &c. de l'Egypte*, who makes the representations at Esne 1800 years older than the other; but his hypothesis has been in turn overthrown by MM. Ideler and Biot. The truth seems to be that nothing is as yet definitely known respecting these ancient representations; for the manner in which the investigations have been mixed up with the Biblical question of the antiquity of man, has prevented any truly scientific research. The Greeks would seem to have borrowed their constellations from the Egyptians and Babylonians, and this is corroborated, to some extent, by occasional remarks in Greek writers as to the positions of various constellations at certain times, which positions are inconsistent with the supposition of the observer being in Greece. The zodiacal figures of the Hindus, ancient Persians, Chinese, and Japanese have such a remarkable resemblance to those of the Egyptians, that there can be little doubt as to their common origin.

ZODIACAL LIGHT is the name given to a singular appearance seen after sunset or before sunrise, at all seasons of the year in low latitudes, but rarely in this country, except in March, April, and May in the evenings, and six months later in the mornings. It is obviously due to illuminated (partly, perhaps, self-luminous) matter surrounding the sun in a very flat, lenticular form, nearly coinciding with the plane of the ecliptic, or rather with the sun's equator, and extending to a distance from the sun greater than that of the earth, since its apex is often seen more than 90° from the sun. It seems to have been first distinctly pointed out by Cassini, and was long regarded as the sun's *atmosphere*. This idea, however, is totally irreconcilable with mechanical principles; since, to assume so flat a form, in spite of the enormous attraction of the sun, and its own elasticity, an atmosphere would have to revolve with a velocity so great as to dissipate it into space. The only conceivable explanation of the phenomenon is, therefore, to be found in supposing it to consist (like the rings of Saturn) of an immense assemblage of small cosmical masses, rocks, stones, and pieces of metal, such as are continually encountering the earth in the form of *ærolites* or meteorites. For the dynamical stability of such a system, it is only necessary that each fragment should separately describe its elliptic orbit about the sun. The mutual perturbations of the system, on account of the enormous mass of the sun, will be exceedingly small, except in the case of actual collision; but some of the planets will have a considerable effect upon it. That this is the true explanation of the phenomenon, is now generally believed. Some very curious recent observations on the August and November meteorites of 1866 (see METEORITES in SUPPLEMENT) have shown that these bodies move in orbits almost exactly the same as those of two known comets. The comet, then, is merely that portion of the ring of small masses, revolving all nearly in the same orbit, where the greatest number are, for the time, collected: and it is possible that to the collisions, which must most frequently occur where the separate particles are most numerously grouped, are due the spectral phenomena of incandescent gases which have been observed in the heads of comets by Huggins and

others. Such speculations, were this the place to pursue them, might easily be extended to the sudden production, and changes of form, of the tails of comets which occur near perihelion, for there the separate masses must necessarily be much more crowded together, and their impacts must be increased both in number and violence.

ZOILUS, a grammarian, born at Amphipolis. Authorities vary respecting the age in which he lived, and the manner of his death. The usual account is that he lived in the time of Ptolemy Philadelphus, and that he solicited, but without success, the patronage of that monarch. He gained notoriety for the bitterness with which he attacked Homer, whence he was surnamed *Homeromastic*, Homer's Scourge. His name is used proverbially for an austere and malignant critic, as Aristarchus is for one candid and intelligent. All his works are lost.

ZO'LLVEREIN (Ger., meaning 'customs-union'), a union of different independent German states, under the leadership of Prussia, so as to enable them, in their commercial relations with other countries, to act as one state. When, after the war of liberation in 1815, the political union, destroyed by the downfall of 'the holy Roman Empire,' had been restored to a certain degree in the German 'Bund' (see GERMANY), internal commerce was felt to be trammelled and depressed by the collection of revenue at the frontiers of every petty state; nor was it possible, without united action, to carry out the policy in regard to foreign commerce which might be thought best for protecting and developing the native trade and manufactures. The first suggestion of such a union came from Prussia; but it took many years before an actual beginning was made, and still longer before it reached its present extent, as the plan was opposed for a long time by the jealousies and special interests of many of the states.

From 1819 to 1828, only some of the minor principalities enclosed within the Prussian territories had been got to conform to the Prussian commercial system; but in 1828, Hesse-Darmstadt, and in 1831, Hesse-Cassel, gave in. This was followed, in 1833, by the accession of Bavaria, Württemberg, the kingdom of Saxony, the principality of the same name, Schwarzburg, and Reuss; and in 1835—1836, by that of Baden, Nassau, and Frankfurt-on-the-Main. The adhesion of other states was given gradually, that of Hanover not till 1851. Recently, Slesvig-Holstein and Lauenburg have, as parts of the Prussian monarchy, also entered the Z.; so that at present it embraces all Germany except the German provinces belonging to Austria, the three free cities, Hamburg, Lübeck, and Bremen, and the two duchies of Mecklenburg. During the period of its formation, several rival unions were formed, but none of them lasted long.

The treaty of union is agreed upon for a definite term of years, and is renewed from time to time (1842, 1853). The principle of its action is this: the whole territory embraced by the Union forms commercially (in regard, at least, to countries beyond its limits) one state. The duties on exports, imports, and through-transports are collected at all the frontiers of the Union according to a uniform tariff (subject to some concessions, made on special grounds, to individual states); and the proceeds, after paying the expenses of collection, are divided among the members of the Union in proportion to their several populations. In regard to the internal trade of the Union, as the duties on articles manufactured for home consumption are different in the different states, a complicated system of drawbacks comes

into play, in order to put the commerce of all on an equal footing. The net proceeds of the Z., which in 1834 amounted only to 12,178,761 thalers, had risen in 1865 to 23,991,085 thalers (about £3,600,000).

As a proof of the beneficial working of the Z., the advocates of the protective policy to which it has adhered, point to the almost complete disappearance of foreign goods from the German market, the increased demand for German goods (especially hardware) in other countries, and the growing wealth and prosperity of Germany.

It appears probable that the Z. will not only be continued in its present limits under the new order of things, but that the whole of non-Austrian Germany will soon be included in the union, which is about to be reorganised.

ZOLOTONO'SHA, a town of Russia, in the government of Poltava, stands on a river of the same name, a tributary of the Dnieper, about 110 miles west of the town of Poltava. The town has two convents. There are no manufactures or trade worth notice. Pop. 6864.

ZO'MBOR, a town of South Hungary, on a broad plain about 120 miles south of Pesth, capital of the district of Bacs, near the Bacs or Francis Canal, by means of which it communicates with the Danube. It has handsome county buildings, Greek and Roman Catholic churches, gymnasium and other schools, barracks, town-house, &c. There are silk manufactures, and a trade in grain and cattle. Pop. 22,406.

ZONU'RIDÆ, a family of saurian reptiles, having the head covered with regular polygonal shields, the body and tail with large scales; the sides furnished with a longitudinal fold of the skin, covered with small scales; the tongue flat, nicked at

Zonurus.

the tip, the eyes with two valvular lids. The species are numerous, natives of warm climates. The form of some is rather short and thick, others are long and serpent-like. In some also, the limbs are well developed, in others they are merely rudimental, and in some the very rudiments of them are entirely concealed under the skin.

ZOO'LOGY (Gr. *zōon*, an animal, and *logos*, a discourse), the science which has for its subject the Animal Kingdom (q. v.). This science, itself a branch of Natural History (q. v.), is divided into a number of branches, which are often pursued as distinct sciences, the subject being too large to be thoroughly studied except in this manner; although it is also necessary that the results of investigation in particular departments should be brought together, so that the animal kingdom may be viewed as a whole, and the relations of the most widely different groups of animals to each other determined. The number of species of animals is far greater than that of plants, and the diversity among them is also greater, so that a division of the science of Z. into branches relating to different groups, very naturally takes place. Thus, the branch of Z. which has the

Mammalia for its subject has been called *Mazology* (Gr. *mazon*, a teat), an unhappily chosen and essentially incorrect term, which has not come into general use; and it is a curious circumstance that this, which may be called the highest branch of Z., has no popularly received name. It is otherwise with the branches of Z. relating to the inferior classes of *Vertebrata*; that which has *Birds* for its subject is universally known as *Ornithology* (q. v.); that which relates to *Reptiles* is *Herpetology* (q. v.), and the subordinate branch relating to serpents is sometimes called *Ophiology*; that which relates to *Fishes* is *Ichthyology* (q. v.). Among *Invertebrate animals*, the great group of *Mollusca* is the subject of the science of *Malacology* (q. v.), although this term is not in such general use as some of those already mentioned; and when shells rather than the animals which bear them are considered, the term *Conchology* (q. v.) is employed. No particular term is commonly applied to the branches of Z. which treat of the *Crustacea*, *Arachnida*, &c.; but that which relates to *Insects* is universally known as *Entomology* (q. v.), and the term *Helminthology* (q. v.) is employed to designate that which has *Worms* for its subject. No similar terms are used for the branches of this science which relate to other groups of *Invertebrata*.

The science of Z., however, divides itself into distinct sciences, not only in accordance with the divisions of the animal kingdom, but also with regard to particular branches of the subject which may be studied either in relation to animals generally, or to any particular species. Thus, *Anatomy* (q. v.) may be regarded as a branch of Z., when the term Z. is taken in its largest sense, as including man along with the inferior animals, and *Ethnology* (q. v.) must in like manner be considered as belonging to it. The anatomy of the inferior animals is sometimes called *Zootomy*, and the term *Comparative Anatomy* is employed when their structure is studied in relation to that of man, and the structure of one division of the animal kingdom in relation to that of the others. *Physiology* (q. v.) is one of the most important branches of Z.; and with it that branch of chemistry which treats of animal substances is closely connected. A very interesting branch of Z. is that which relates to the habits and instincts of animals. It can hardly be said to have been constituted into a separate science, but has received much attention from those naturalists who have devoted themselves to the study of particular groups of animals.

We have no evidence that the study of Z. was prosecuted to any considerable extent before the time of Aristotle. In his hands it became at once a science, and the foundations of a system of classification were laid. No artificial system of classification has ever been proposed in Z., like the sexual system of Linnaeus in botany; but from the very first to the present day, a natural grouping of animals has always been attempted. To this, the widely marked distinctions between the principal groups almost unavoidably led. Aristotle brought to bear upon the subject the highest powers both of observation and of generalisation, and some of the groups established by him still retain their place in the most modern systems. Aristotle divided the whole animal kingdom into two great sections, the highest, *Enaima*, consisting of animals having blood (i. e. red blood), and the lower, *Anaima*, of animals having a colourless fluid instead of blood, the former corresponding to the *Vertebrata*, and the latter to the *Invertebrata* of modern zoologists.

No other ancient writer deserves much notice in a historic sketch of zoology. *Ælian* and *Pliny* shew no capacity for the scientific treatment of the subject, and in their writings, facts are largely mingled with fables. During the middle ages, Z., like other

kindred sciences, was almost completely neglected. For many centuries, the only name worth mentioning, in connection with the history of the science, is that of Albert, Count of Bollstädt, commonly called Albertus Magnus; whose knowledge, however, was entirely derived from Aristotle and other ancient authors, and all he did was merely to call attention to the forgotten science, without making any contribution to its advancement. From his time, in the first half of the 13th c., to the beginning of the 16th, Z. was again almost completely neglected; but the new activity of mind which then displayed itself soon sought this as well as other directions, and an impulse was more especially given to Z. as well as to some other branches of science, by the progress of geographical discovery; curiosity being awakened with regard to the strange productions of the New World, and of the eastern and southern regions, till then equally unknown. The names of Belon (q. v.) and Rondelet (see SUPPLEMENT) are the two greatest in this department at this period, and by them Z. was enriched with many new facts, while attempts were also made at a more perfect classification. Aldrovandi (see SUPPLEMENT) and Gesner (q. v.) soon followed them, besides others who began to direct their attention more specially to particular branches of Z., some of whom greatly extended the science by their observations on the animals of newly discovered countries. It was not till after the middle of the 17th c., however, that any real progress was made in classification, founded upon a philosophical study and comparison of animals. The works of Ray (q. v.) are described by Cuvier as 'the foundation of modern zoology.' The materials, however, were in great part prepared, and the first outline of a system sketched by Willughby, the friend of Ray, whom Ray long survived, and whose works he edited. From the days of Aristotle, Z. had never been prosecuted with such acuteness of observation, accuracy of description, and breadth of philosophical generalisation as it was by Willughby and Ray. The progress of the science now became very rapid. Buffon won for it, by his interesting descriptions and brilliant style, the general attention of the educated portion of society, not only in his own but in other countries, and was almost immediately followed by Linnaeus, who, extending his studies from botany to Z., not only extended the science by his own observations and discoveries, but rendered it far greater service by gathering together the facts ascertained by others, and by the improvement which he effected in classification. Some of the larger groups established by Linnaeus have been retained by all subsequent naturalists without essential modification of their characters, and even his smallest groups—genera—have been very generally retained, although now regarded as constituting tribes or families. According to the Linnæan system, the animal kingdom is divided into six great classes, which are further brought together in groups of two each, as follows:

| | | |
|---|-----------------|-------------------|
| Heart bilocular, with two auricles, blood warm, red, | } Viviparous. | 1. Mammalia. |
| Heart unilocular, with one auricle, blood cold, red, | | } Oviparous. |
| Heart unilocular, with one auricle, blood cold, red, | } With lungs. | 3. Amphibia. |
| Heart unilocular, with one auricle, circulating fluid (anæmic) cold, white, | | } With gills. |
| | } With antennæ. | 5. Insects. |
| | | } With tentacula. |

The orders into which Linnaeus divided these classes have, in the most important instances, been already noticed, either under the classes, or separately. It was, however, in constituting and defining the genera that Linnaeus shewed in the highest degree his powers both of observation and arrangement. His labours in the lower departments of the animal kingdom were much less perfect than in the higher;

but others speedily entered upon the field, and whilst new species of animals and their habits continued to be described, the study of comparative anatomy was also diligently prosecuted, and thus preparation was made for a more complete and philosophical system of zoology. The names of Pallas, Hunter, and Blumenbach are particularly worthy to be noticed; but more than any other, the name of Cuvier, who, like Linnæus, took a comprehensive view of the whole subject of Z., and carried forward the work of minute observation as well as of generalisation. His system of classification is rather an improvement of that of Linnæus than one fundamentally new, and it has formed a new starting-point for all further progress. The divisions, the classes, and many of the orders of Cuvier's system have already been noticed under their proper heads, so that it may be enough here to give the most general outline of the system, shewing Cuvier's four great divisions of the animal kingdom, and the classes which he arranges under them.

- DIV. I. VERTEBRATA. Class I. *Mammalia*.
 " II. *Aves* (Birds).
 " III. *Reptilia* (Reptiles).
 " IV. *Pisces* (Fishes).
- DIV. II. MOLLUSCA. Class I. *Cephalopoda*.
 " II. *Pteropoda*.
 " III. *Gasteropoda*.
 " IV. *Acephala*.
 " V. *Brachiopoda*.
 " VI. *Cirrhopoda*.
- DIV. III. ARTICULATA. Class I. *Insecta* (Insects).
 " II. *Crustacea*.
 " III. *Arachnida*.
 " IV. *Annelida*.
- DIV. IV. RADIATA. Class I. *Echinodermata*.
 " II. *Entozoa*.
 " III. *Acalepha*.
 " IV. *Polypi*.
 " V. *Infusoria*.

The system of Cuvier has been modified by Lamarck, Virey, Duméril, De Blainville, F. Cuvier, and others; and in consequence of the progress of scientific discovery, more considerable changes have recently been proposed by eminent naturalists, some of them amounting almost to a reconstruction of the greater part of the system; whilst in particular departments, and especially those which contain the lower forms of animal life, Cuvier's arrangement, regarded by himself as merely provisional, may be said to have already become completely antiquated.

A complete system of the animal kingdom has been proposed by Agassiz. He adopts the four great divisions of Cuvier, but makes much change in the subdivisions, acknowledging, however, that much is still uncertain, and that a satisfactory arrangement must depend upon anatomical and embryological researches yet to be made. The following is an outline of his system:

DIVISION I.—RADIATA.

- Class I. *Polypi*, Order 1. *Actinoidea*.
 " 2. *Halcyonoidea*.
- " II. *Acalepha*, Order 1. *Hydroidea* (including *Siphonophora*).
 " 2. *Discophora*.
 " 3. *Ctenophora*.
- " III. *Echinodermata*, Order 1. *Orinoidea*.
 " 2. *Asteroidea*.
 " 3. *Echinoidea*.
 " 4. *Holothurida*.

DIVISION II.—MOLLUSCA.

- Class I. *Acephala*, Order 1. *Bryozoa* (including the *Vorticellida*).
 " 2. *Brachiopoda*.
 " 3. *Tunicata*.
 " 4. *Lamelliobranchiata*.

- Class II. *Gasteropoda*, Order 1. *Pteropoda*.
 " 2. *Heteropoda*.
 " 3. *Gasteropoda* proper.
- " III. *Cephalopoda*, Order 1. *Tetrabranchiata*.
 " 2. *Dibranchiata*.

DIVISION III.—ARTICULATA.

- Class I. *Vermes*, Order 1. *Trematoidea* (including *Cestodea*, *Planaria*, and *Hirudinida*).
 " 2. *Nematoidea* (including *Acanthocephali* and *Gordiacea*).
 " 3. *Annelida*.
- " II. *Crustacea*, Order 1. *Rotifera*.
 " 2. *Entomostraca* (including *Cirrhopoda*).
 " 3. *Tetradactylozoa*.
 " 4. *Decapoda*.
- " III. *Insecta*, Order 1. *Myriapoda*.
 " 2. *Arachnida*.
 " 3. *Insecta* proper.

DIVISION IV.—VERTEBRATA.

- Class I. *Myxozoa*, Order 1. *Myxinoidea*.
 " 2. *Cyclostomata*.
- " II. *Pisces* (Fishes proper), Order 1. *Ctenoidea*.
 " 2. *Cycloidea*.
- " III. *Ganoidea*, Order 1. *Calacanthia*.
 " 2. *Accipenseroides*.
 " 3. *Saurioidea*.
 " 4. *Siluroidea*.
 " 5. *Plectognatha*.
 " 6. *Lepthobranchia*.
- " IV. *Selachia*, Order 1. *Chimæra*.
 " 2. *Galeoda*.
 " 3. *Batida*.
- " V. *Amphibia*, Order 1. *Cacilia*.
 " 2. *Ichthyodi*.
 " 3. *Anura*.
- " VI. *Reptilia*, Order 1. *Serpentes*.
 " 2. *Saurii*.
 " 3. *Rhizodontes*.
 " 4. *Testudinata*.
- " VII. *Aves*, Order 1. *Natatores*.
 " 2. *Gralla*.
 " 3. *Rasores*.
 " 4. *Incessores* (including *Scansores* and *Accipitres*).
- " VIII. *Mammalia*, Order 1. *Marsupialia*.
 " 2. *Herbivora*.
 " 3. *Carnivora*.

The three Cuvierian divisions of *Vertebrata*, *Mollusca*, and *Articulata* have been very generally retained by systematic zoologists, without much change as to the classes or even orders of animals included in each, although it is now generally admitted that the *Cirrhopoda* are not to be ranked among the *Mollusca*, but, as *Crustaceans*, among the *Articulata*; and the *Polyzoa* or *Bryozoa*, formerly placed with other 'zoophytes' among the *Radiata*, have been removed by many naturalists to a place among the *Mollusca*. Amongst the *Radiata* of Cuvier, great changes have been made; and it may be well to indicate here some of the chief of the new groups which have been proposed, and pretty generally accepted by naturalists, although their proper order and their relations to each other cannot be so well set forth as in those departments of the animal kingdom which have been more thoroughly studied. Greater importance has been assigned by recent naturalists than by their predecessors to the nervous system as a basis of classification. The lowest animals, those in which no

trace of a nervous system has been discovered, have been formed into a separate division of the animal kingdom, under the names *Acria* and *Protozoa* (q. v.), the latter of which has obtained general preference. Higher in organisation than the *Protozoa* are the *Nematoneura* of Owen, having a nervous system distinctly traceable in a filamentary form, and including all the higher orders of Cuvier's *Radiata*. Some groups, as *Anthozoa* (see *ZOOPLHYTE*), still occupy a doubtful intermediate place between *Protozoa* and *Nematoneura*. To the *Articulata*, Owen has, with regard to their nervous system, given the name *Homogangliata* (q. v.), and to the *Mollusca* the name *Heterogangliata* (q. v.). In like manner, he has recently introduced in his classification of the Vertebrata the terms *Hemothermal* and *Hematoeryal*, these being merely words formed from the Greek, and signifying respectively *Warm-blooded* and *Cold-blooded*, the former including *Mammalia* and *Birds*, the latter, *Reptiles* and *Fishes*. Further information about the recent classification of some of the lower groups of animals, will be found in the article *WORMS*.

In the study of Z., far more attention has been paid recently than formerly to the relation which each part of the animal organisation bears to the whole, as the *Respiratory System* to the *Circulatory System*, the *Digestive System*, the *Nervous System*, &c. The study of the science has thus become more philosophical, and the view obtained of nature more complete; and if the difficulty of classification is found greater than when characters derived from particular parts of the organisation were more exclusively regarded, the result, when fairly wrought out, is a system at once more perfect and more natural.

ZOOPLHYTE (derived from the Greek *zōon*, an animal, and *phuton*, a plant, and signifying an animal-plant) is a term which was employed by Cuvier in the same sense as he employed *Radiata*—viz., to designate the lowest primary division of the animal kingdom, which includes many animal organisms that are fixed to a definite spot of rock, shell, &c., and have the form of plants. His zoophytes included the anomalous groups of *Infusoria*, *Entozoa*, and *Radiaria*,* the latter of which was subdivided into the *Hydrozoa*, *Anthozoa*, *Acalepha*, *Echinodermata*, and *Bryozoa*.* Subsequent writers excluded the *Infusoria* and *Entozoa* from the zoophytes, and left only those constructed on the radiated type. These were afterwards found to present extreme differences of structure, and it became obvious that the lower forms of *Hydrozoa* and *Anthozoa* could not be associated with the *Bryozoa*, which approximate closely to the lower molluscs. The term is now never employed by scientific naturalists.

ZOOOSPORE (Gr. *zōos*, living, and *spora*, a seed), in Botany, the name given to those Spores (q. v.), or seeds of acotyledonous plants, which being furnished with cilia, move spontaneously for a short time after being discharged from the spore-case of the parent plant. The motions of their cilia resemble those of the cilia on the Epithelium (q. v.) of the higher animals, and on the external surface of some of the lower tribes, as *Acalepha* (q. v.). In these cases in the animal kingdom, as in this case in the vegetable kingdom, there is no appearance of volition, the motion being probably owing to changes of hygro-metric or of electric condition, or of both. The purpose served by the ciliary motion in zoospores, is evidently the wider diffusion of seeds; and the

cessation of the motion after a certain time permits the seed to become fixed, in order to germination. Zoospores are found in *Characea*, *Alga*, *Fungi*, and *Lichens*. They have often been mistaken by observers with the microscope for animalcules. Similar to them, in the property of locomotion, simulating that of animals, is another class of bodies, also connected with the reproduction of acotyledonous plants, called *Phytosoa* (q. v.).

ZORNDORF, a village four English miles north of Küstrin, was the scene of the bloodiest of the many desperate conflicts of the *Seven Years' War* (q. v.). The Russians having for the second time been ordered by the Czarina Elizabeth to invade Prussia, advanced towards Berlin, committing frightful devastations, while Frederick the Great, with the bulk of his forces, was engaged with the Austrians in Silesia and Saxony. The Russians, under Fermor, were 60,000 strong, and easily drove before them Dohna's little Prussian army of 15,000; but Frederick being speedily apprised of this new invasion, hastened northwards with such a reinforcement as raised the army to 30,000; and after taking care, by the breaking down of bridges, &c. to cut off their retreat, engaged the invaders. The battle, which commenced at eight in the morning of August 25, 1758, and lasted till evening, consisted mainly in a succession of furious charges, accompanied with a tremendous artillery-fire, and was not decided till Seidlitz, by an able movement, turned the Russian flank. The Russians, now discovering that they were nearly surrounded, fought with the utmost desperation, and ultimately both armies bivouacked on the field of battle. In the morning, however, Fermor drew off his forces, diminished by 20,000 men, 103 cannon, and 27 standards; having inflicted on the Prussians a loss of 13,000 men, 26 cannon, and a few standards. Generals Soltikof, Czernitshof, and Prince Sulkowski were made prisoners by the Prussians on this occasion; and, oddly enough, the first named was the conqueror of Frederick II. in the next great battle between the two northern powers, at Kunersdorf (q. v.).

ZOROASTER, or rather **ZARATHUSTRA** (which in Greek and Latin was corrupted into **ZARASTRADES** and **ZOROASTRES**; while the Persians and Parsees altered it into **ZERDUSHT**), is the name of the founder of what is now known as the Parsee religion. The original meaning of the word is uncertain, and though there have been many conjectures formed about it, yet not one of them seems to be borne out by recent investigations. Most probably, it only indicates the notion of 'Chief,' 'Senior,' 'High-priest,' and was a common designation of a spiritual guide and head of a district or province. Indeed, the founder of Zoroastrianism is hardly ever mentioned without his family name—viz., Spitamā. He seems to have been born in Bactria. The terms he applied to himself are either *Manthran*, i. e., a reciter of Manthras; a messenger sent by Ahuramazda; a speaker; one who listens to the voice of oracles given by the spirit of nature; one who receives sacred words from Ahuramazda through the flames. His life is completely shrouded in darkness. Both the Greek and Roman, and most of the Zend accounts about his life and works are legendary and utterly unhistorical. In the latter, he is to a great extent represented, not as a historical, but as a dogmatical personality, vested with superhuman, or rather divine powers, standing next to God, above the archangels themselves. His temptations by the devil, whose empire is threatened by him, form the subject of many traditional reports and legends.

* These terms have been introduced since the time of Cuvier—the former, we believe, by Owen; and the latter by Farre.

He is represented as the abyss of all wisdom and truth, and the master of the whole living creation. 'We worship'—so runs one of the prayers in the Fravardin Yasht—'the rule and the guardian angel of Zarathustra Spitama, who first thought good thoughts, who first spoke good words, who first performed good actions, who was the first priest, the first warrior, the first cultivator of soil, the first prophet, the first who was inspired, the first who has given to mankind nature, and reality, and word, and hearing of word, and wealth, and all good things created by Mazda, which embellish reality; who first caused the wheel to turn among gods and men, who first praised the purity of the living creation and destroyed idolatry, who confessed the Zarathustrian belief in Ahuramazda, the religion of the living God against the devils. . . . Through whom the whole true and revealed word was heard, which is the life and guidance of the world. . . . Through his knowledge and speech, the waters and trees become desirous of growing; through his knowledge and speech, all beings created by the Holy Spirit are uttering words of happiness.'

In the old *Yasna* (see *ZEND-AVESTA*) alone, he appears like a living reality, a man acting a great and prominent part both in the history of his country and that of mankind. His father's name seems to have been Pourushâspa, and that of his daughter, the only one mentioned of his children, Pouruchista. Very obscure, however, remains, even by this account, the time when he lived. The dates generally given are as follows. Xanthos of Lydia places him about 600 years before the Trojan war; Aristotle and Eudoxus place him 6000 years before Plato; others, again, 5000 years before the Trojan war. Berosus, a Babylonian historian, makes him a Babylonian king, and the founder of a dynasty which reigned between 2200 and 2000 B.C. over Babylon. The Parsees place him at the time of Hystaspes, Darius's father, whom they identify with a king mentioned in the *Shâh-Nâmeh* (q. v.), from whom, however, Hystaspes is totally distinct. This account would place him at about 550 B.C. Yet there is scarcely a doubt that he must be considered to belong to a much earlier age, not later than 1000 B.C.; possibly, he was a contemporary of Moses. It is almost certain that Z. was one of the Soahyantôs, or fire-priests, with whom the religious reform, which he carried out boldly, first arose. These were probably at first identical with the Vedic Atharvans (fire-priests), as indeed Zoroastrianism is merely an advanced stage of Brahmanism. The former creed, that of Ahura, by way of eminence, transformed, after the outbreak of the schism, the good beings of the latter into devils or devas; e.g., the purely Brahmanic Indra, Sharva, Nâsatya, &c.—unless it promoted them into saints and angels (*yagatas*). The conflict that led to this schism between the Iranians and those Aryan tribes which immigrated into Hindustan Proper, and whose leaders became afterwards founders of Brahmanism, sprung from many social, political, and religious causes. The Aryans seem to have originally led a nomad life, until some of them, reaching, in the course of their migrations, lands fit for permanent settlements, settled down into agriculturists. Bactria and the parts between the Oxus and Jaxartes seem to have attracted them most. The Iranians became gradually estranged from their brother tribes, who adhered to their ancient nomad life; and by degrees, the whilom affection having turned into hatred, considered those peaceful settlements a fit prey for their depredations and inroads. The hatred thus nourished, by further degrees included all and everything belonging to these devastators; even their religion, originally identical with that of the

settlers. The 'Deva religion' became, in their eyes, the source of all evil. Moulded into a new form, styled the 'Ahura' religion, the old elements were much more changed than was the case when Judaism became Christianity. Generation after generation further added and took away, until Zarathustra, with the energy and the clear eye that belongs to exalted leaders and founders of religions, gave to that which had originally been a mere reaction and spite against the primitive 'Brahmanic' faith, a new and independent life, and for ever fixed its dogmas, not a few of which have sprung from his own brains.

It is, as we said in the article on the *ZEND-AVESTA*, chiefly from the Gâthas that Zarathustra's real theology, unutilized by later ages, can be learned. His leading idea was monotheism. Whatever may have caused the establishment of the dualism of gods, the good and the evil, in the Persian religion—a dualism so clearly marked at the time of Isaiah, that he found it necessary to protest emphatically against it—it was not Z. who proclaimed it. His dualism is of a totally different nature. It was merely the principle of his speculative philosophy—a supposition of two primeval causes of the real and the intellectual world. His moral philosophy, on the other hand, moved in a triad—thought, word, and deed. There is no complete system of Zoroastrian philosophy to be found in the *Zend-Avesta*, any more than there is a developed Platonic system laid down explicitly in the Platonic writings; but from what is to be gathered in the documents referred to, it cannot be doubted that Z. was a deep and great thinker, far above his contemporaries, and even many of the most enlightened men of subsequent ages. If proof were needed for the high appreciation in which he was held in antiquity, it might be found in the circumstance, that even the Greeks and Romans, not particularly given to overrating foreign learning and wisdom, held him in the very highest estimation, as may be seen by their reiterated praises of the wisdom of him whose name they scarcely knew how to pronounce.

* With regard, then, to the first point, his monotheism, it suffices to mention, that while the fire-priests before him, the Soahyantôs, worshipped a plurality of good spirits called Ahuras, as opposed to the Indian devas, he reduced this plurality to a unity. This one supreme being he called Ahurô Mazdaô (that Ahura which is Mazdaô), or the creator of the universe—the Auramazda of the cuneiform inscriptions of the Achemenidian kings, the Ahuramazd of Sassanian times, and the Hormazd or Ormazd of modern Parsees. This supreme god is by Z. conceived to be 'the creator of the earthly and spiritual life, the lord of the whole universe, at whose hands are all the creatures.' The following extract from the Gâtha (*Ustavaiti*) will leave no doubt on that much-contested point: 'Blessed is he, blessed are all men to whom the living wise God of his own command should grant those two everlasting powers (viz., immortality and wholeness). . . . I believe Thee, O God, to be the best thing of all, the source of light for the world. Everybody shall choose Thee as the source of light, Thee, Thee, holiest spirit Mazda! Thou createst all good things by means of the power of Thy good mind at any time, and promiseest us, who believe in Thee, a long life. I believe Thee to be the powerful holy god Mazda! for Thou givest with Thy hand, filled with help, good to the pious man, as well as to the impious, by means of the warmth of the fire strengthening the good things. From this reason, the vigour of the good mind has fallen to my lot. . . . Who was in the beginning the father and the creator of truth? Who shewed to the sun and the

stars their way? Who causes the moon to increase and wane, if not Thou? . . . Who is holding the earth and the skies above it? Who made the waters and the trees of the field? Who is in the winds and in the storms that they so quickly run? Who is the creator of the good-minded beings, Thou wise? Who made the lights of good effect and the darkness? Who made the sleep of good effect and the activity? Who made morning, noon, and night? Ahuramazda is thus to Z. the light and the source of light. He is wisdom and intellect; he possesses all good things, temporal and spiritual, among them the good mind, immortality, wholesomeness, the best truth, devotion, piety, and abundance of all earthly good. All these gifts he grants to the pious man who is pure in thought, word, and deed. He rewards the good, and punishes the wicked; and all that is created, good or evil, fortune or misfortune, is his work alone.

We spoke of Z.'s philosophical dualism, and of its having often been confounded with theological dualism, which it is certainly very far from being. Nothing was further from Z.'s mind than to assume anything but one supreme being, one and indivisible. But that everlasting problem of all thinking minds—viz. the origin of evil, and its incompatibility with God's goodness, holiness, and justice—he attempted to solve by assuming two primeval causes, which, though different, were united, and produced the world of the material things as well as that of the spirit. The one who produced the reality (*gaya*) is called *Vohu Mano*, the good mind; the other, through whom the non-reality (*ajyâiti*) originated, is the *Akem Mano*, the naught mind. To the first belong all good, true, and perfect things; to the second, all that is delusive, bad, wicked. These two aboriginal moving causes of the universe are called twins. They are spread everywhere, in God as in men. When united in Ahuramazda, they are called *Cpentô Mainyus*, and *Angrô Mainyus*—i. e., white or holy; and dark spirit. It is only in later writings that these two are supposed to be opposed to each other, not within Ahuramazda, but without—to stand, in fact, in the relation of God and Devil to each other. The inscriptions of Darius know but one god, without any adversary whatsoever. But while the one side within him produced all that was bright and shining, all that is good and useful in nature, the other side produced all that is dark and apparently noxious. Both are as inseparable as day and night, and though opposed to each other, are indispensable for the preservation of creation. The bright spirit appears in the blazing flame, the presence of the dark is marked by the wood converted into charcoal. The one has created the light of the day, the other the darkness of night; the former awakens men to their duty, the other lulls them to sleep. Life is produced by the one, and extinguished by the other, who also, by releasing the soul from the fetters of the body, enables her to go up to immortality and everlasting life.

We have said already that the original monotheism of Z. did not last long. False interpretations, misunderstandings, changes, and corruptions crept in, and dualism was established in theology. The two principles then for the first time became two powers, hostile to each other, each ruling over a realm of his own, and constantly endeavouring to overthrow the other. This doctrine, which appears first fully developed in the *Vendidad*, once accepted by some of the most influential leaders, it soon followed that, like terrestrial rulers, each of the two powers must have a council and a court of his own. The number of councillors was six, each having to rule over some special province of creation; but Ahuramazda,

who at first merely presided over this council, came gradually to be included in their number, and we then read of seven instead of the usual six *Amešaspentas*, or Immortal Saints. These six supreme councillors, who have also found their way into the Jewish tradition embodied in the Talmud, are both by etymology and the sense of the passages in which they figure, distinctly seen to be but abstract nouns or ideas, representing the gifts which God grants to all those who worship with a pure heart, who speak the truth, and perform good actions. The first of these angels or principles (*Vohu Mano*) is the vital faculty in all living beings of the good creation. He is the son of Ahuramazda, and penetrates the whole living good creation. By him are wrought all good deeds and words of men. The second (*Ardibehešt*) represents the blazing flame of fire, the light in luminaries, and brightness and splendour of any and every kind. He represents, as the light, the all-pervading, all-penetrating Ahuramazda's omnipresence. He is the preserver of the vitality of all life and all that is good. He thus represents Providence. The third presides over metals, and is the giver of wealth. His name is *Sharavar*, which means possession, wealth. The fourth (*Issandarmat* = Devotion) represents the earth. It is a symbol of the pious and obedient heart of the true Ahuramazda worshipper, who serves God with his body and soul. The two last (*Khordâd* and *Amerdât*) preside over vegetation, and produce all kinds of fruit. But apart from the celestial council stands *Sraosha* (*Serost*) the archangel, vested with very high powers. He alone seems to have been considered a personality. He stands between God and man, the great teacher of the prophet himself. He shows the way to heaven, and pronounces judgment upon human action after death. He is, in the *Yazna*, styled the Sincere, the Beautiful, the Victorious, who protects our territories, the True, the Master of Truth. 'For his splendour and beauty, for his power and victory,' he is to be worshipped and invoked. 'He first sang the five *Gâthas* of Zarathustra *Spitama*;' that is, he is the bearer and representative of the sacred tradition, including the sacrificial rites and the prayers. He is the protector of all creation, for 'he slays the demon of Destruction, who prevents the growth of nature, and murders its life. He never slumbers, but is always awake. He guards with his drawn sword the whole world against the attacks of the demons, endowed with bodies after sunset. He has a palace of 1000 pillars, erected on the highest summit of the mountain *Alborj*. It has its own light from inside, and from outside it is decorated with stars. . . . He walks teaching religion round about the world.' In men who do not honour him by prayer, the bad mind becomes powerful, and impregnates them with sin and crime, and they shall become utterly distressed both in this life and in the life to come.

In the same manner as Ahuramazda, his counterpart, *Angrômainyus*, was in later times endowed with a council, imitated from the one just mentioned, and consisting of six devas, or devils, headed by *Angrômainyus* himself, who is then styled *Devânâm Devo* = arch-devil. The first after him is called *Ako Mano*, or Naught Mind, the original 'non-reality,' or evil principle of Zoroaster. He produces all bad thoughts, makes man utter bad words, and commit sin. The second place is taken by the Indian god *Indra*; the third, by *Shiva* or *Shaurva*; the fourth, by *Naonhaitya*—the collective name of the Indian *Ashuras* or *Dioscuri*; the fifth and sixth, by the two personifications of 'Darkness' and 'Poison.' There are many devas, or devils, besides to be found in the *Zend-Avesta*, mostly allegorical or symbolical names of evils of all kinds. While the

heavenly council is always taking measures for promoting life, the infernal council is always endeavouring to destroy it. They endeavour to spread lies and falsehoods, and altogether coincide together with their great chief, with the devil and the infernal hierarchy of the New Testament.

Thus Monotheism was in later times broken up and superseded by Dualism. But a small party, represented by the Magi, remained steadfast to the old doctrine, as opposed to that of the followers of the false interpretation or Zend, the Zendiks. In order to prove their own interpretation of Zoroaster's doctrines, they had recourse to a false and ungrammatical explanation of the term Zervana Akarana, which, merely meaning time without bounds, was by them pressed into an identity with the Supreme Being; whilst the passages on which the present Destsurs, or Parsee priests, still rest their faulty interpretation, simply indicate that God created in the boundless time, i. e., that He is from eternity, self-existing, neither born nor created. Two intellects and two lives are further mentioned in the Zend-Avesta. By the former are to be understood the heavenly, spiritual wisdom, and the earthly wisdom, i. e., that which is learned by ordinary teaching and experience. The two lives are in the same manner distinguished as the bodily and the mental, i. e., body and soul. From these two lives, however, are to be distinguished the 'first' and 'last' lives, terms which refer to this life and the life to come. The belief in the latter, and in immortality, was one of the principal dogmas of Z., and it is held by many that it was not through Persian influence that it became a Jewish and a Christian dogma. Heaven is called the 'House of Hymns,' a place where angels praise God incessantly in song. It is also called the 'Best Life,' or Paradise. 'Hell' is called the House of Destruction. It is the abode chiefly of the priests of the bad (deva) religion. The modern Persians call the former Behesht; the latter, Duzak. Between heaven and hell, there is the bridge of the gatherer or Judge, over which the soul of the pious passes unharmed, while the wicked is precipitated from it into hell. The resurrection of the body is clearly and emphatically indicated in the Zend-Avesta; and it belongs, in all probability, to Z.'s original doctrine—not, as has been held by some, to later times, when it was imported into his religion by other religions. A detailed description of the resurrection and last judgment is contained in the Bundehesh. The same argument—the almightiness of the Creator—which is now employed to shew the possibility of the elements, dissolved and scattered as they may be, being all brought back again, and made once more to form the body to which they once belonged, is made use of there to prove the Resurrection. There is still an important element to be noticed—viz., the Messiah, or Sosioah, from whom the Jewish and Christian notions of a Messiah are held, by many, to have been derived. He is to awaken the dead bodies, to restore all life destroyed by death, and to hold the last judgment. Here, again, a later period introduced a plurality, notably a Trinity. Three great prophets are also to appear when the end of the world draws nigh, respectively bearing the names of Moon of Happy Rule, Aurora of Happy Rule, and Sosioah, who is supposed to be the son of Zarathustra, begotten in a supernatural way; and he will bring with him a new portion of Zend-Avesta, hitherto hidden from man. Even a superficial glance at this sketch will shew our readers what very close parallels between Jewish and Christian notions on the one hand, and the Zoroastrian on the other, are to be drawn; but, as we have noticed under PARSEES (q. v.), an attentive reading of the Zend-Avesta

reveals new and striking points of contact almost on every page.

We have in the foregoing sketch mainly followed Haug, the *facile princeps* of Zend studies in these days; but we have also taken into account the views of Windischmann, Spiegel, and other prominent investigators, and principally by quoting the words of the sacred sources themselves, when feasible, put our readers in a position to judge on the main points for themselves. We cannot, however, do better than thus briefly summarise, in conclusion, the principal doctrines of Z., as drawn from a certain speech (contained in the Gâthas), which, in all probability, emanates from Z. himself.

1. Everywhere in the world, a duality is to be perceived, such as the Good and the Evil, light and darkness; this life and that life, human wisdom and divine wisdom.
2. Only this life becomes a prey of death, but not that hereafter, over which the destructive spirit has no power.
3. In the universe, there are from the beginning two spirits at work, the one making life, the other destroying it.
4. Both these spirits are accompanied by intellectual powers, representing the ideas of the Platonic system on which the whole moral world rests. They cause the struggle between good and evil, and all the conflicts in the world, which end in the final victory of the good principle.
5. The principal duty of man in this life is to obey the word and commandments of God.
6. Disobedience is punished with the death of the sinner.
7. Ahuramazda created the idea of the good, but is not identical with it. This idea produced the good mind, the Divine Spirit, working in man and nature, and devotion—the obedient heart.
8. The Divine Spirit cannot be resisted.
9. Those who obey the word of God will be free from all defects, and immortal.
10. God exercises his rule in the world through the works prompted by the Divine Spirit, who is working in man and nature.
11. Men should pray to God and worship Him. He hears the prayers of the good.
12. All men live solely through the bounty of God.
13. The soul of the pure will hereafter enjoy everlasting life; that of the wicked will have to undergo everlasting punishment—i. e., as modern Parsee theologians explain, to the day of the resurrection.
14. All creatures are Ahuramazda's.
15. He is the reality of the good mind, word, and deed.' See PARSEES, GUEBRES, ZEND, ZEND-AVESTA, &c.

ZOSIMUS, of Constantinople, a Greek historian, who lived in the 6th c. A. D. He wrote the History of the Roman Emperors, in six books, from Augustus to 410 A. D. His style is concise, clear, and interesting. He seeks to unfold the causes of the decline of the empire, and being himself a pagan, he adduces as the chief, the neglect of the pagan religion which attended the progress of Christianity. The unsparing severity with which he assails various Christian emperors, especially Constantine, has been considered by some (e. g. Bentley) to detract from his credibility as a historian. From his own point of view, he shews a considerable degree of acuteness in his remarks. Nothing is known of his personal history.

ZOSIMUS, POPE, and successor of Innocent I., requires a brief notice on account of his connection with the history of the heresiarch Pelagius (q. v.). Z. was a Greek by birth, and was elected Bishop of Rome, March 1, 417. The African bishops had condemned the opinions of Pelagius, and this judgment had been ratified by Pope Innocent. In the interval, however, Pelagius appealed to the pope; and his disciple, Celestius, came in person to Rome, where he presented a confession of faith in his own justification. Z., having convened a council of bishops and submitted this to them, was

induced by the specious explanations of Celestius to suspend the judgment, and even to write to the African bishops, recommending a reconsideration of the case. This apparent conflict of Z. with his predecessor, although it has been used by the Gallican as well as Protestant controversialists as an argument against papal infallibility, was nevertheless only temporary. On further examination of Celestius, Z. became sensible that he had been deceived; and even before the reply of the African bishops, confirmed and renewed their original condemnation of the Pelagian doctrine. He died December 26, 418. His Letters, which are curious and interesting, are found in Constant's *Epistolæ Romanorum Pontificum*.

ZOUAVES (Arab. *Zawawa*), a body of troops in the French army, which derives its name from a tribe of Kabyles, inhabiting the mountains of Jurjura, in the Algerian province of Constantine. Long previous to the invasion of Algiers by the French, these Kabyles had been employed as hired mercenaries in the service of the rulers of Tripoli, Tunis, and Algiers; and after the conquest of the last-named country in 1830, the French, in the hope of establishing a friendly feeling between the natives and their conquerors, took the late Dey's mercenaries into their service, giving them a new organization. Accordingly, General Clausel created, in 1830, two battalions of Z., in which each company consisted of French and Kabyles in certain proportions, officers, subalterns, and soldiers being selected from either race; the Z., though retaining their Moorish dress, were armed and disciplined after the European fashion; and the battalions were recruited by voluntary enlistment. As it was soon found, however, that the system of commingling the two races did not effect the object intended, the French and Kabyles were formed into separate companies; and in 1837, they were divided into three battalions, and put under the command of a colonel. Their first colonel was Lamoricière, who mainly effected their reorganization, and under whom, as well as his successor, Cavaignac (q. v.), they distinguished themselves in many a bloody conflict with the Arabs of the south. Gradually, however, the native element was eliminated, and since 1840, they may be considered as French troops in a Moorish dress. In 1852 and in 1855, their numbers were greatly augmented, and they now amount to about 15,000 men, divided into four regiments of three battalions each. They are recruited from the veterans of the ordinary infantry regiments who are distinguished for their fine 'physique' and tried courage and hardihood; clad in a loose jacket and waistcoat of dark-blue cloth ornamented with yellow braid, loose madder-coloured trousers, brown cloak, madder-coloured Fez cap with a yellow tassel, surrounded by a green turban, a light blue sash of wool, yellow leather leggings, and white gaiters; and armed with a carbine and sword-bayonet. The uniform of the officers and subalterns is the same as that of the hussars.

One regiment of Z., of two battalions, is incorporated in the Imperial Guard. The name Z. was also given to several regiments which served on the side of the Federals in the recent American civil war; but except by their brilliant and picturesque dress, they were not distinguishable from the other volunteer regiments of the army.

ZSCHOKKE, JOHANN HEINRICH DANIEL, one of the most eminent German authors of this century, was born at Magdeburg on March 22, 1771. On leaving school at the age of 17, he joined a company of players in the capacity of a dramatic author. He travelled with them for some time, after which

he returned to his family, and entered the university of Frankfurt. There he seems to have studied all subjects from divinity to administration (*Kameralwissenschaften*). He at the same time acted as a private teacher, and published plays which brought him some reputation, but no pay. In 1795, he was disappointed in obtaining the post of Ordinary Professor, for which he applied, and set out on a tour through Germany and France. He settled finally at Reichenau, in the Grisons, where he opened a boarding-school. So much pleased were the governing bodies of the canton with his establishment, that they presented him with the citizenship. In return for this favour, he wrote a *History of the Grisons*, published at Zürich in 1798 (*Geschichte des Freistaats der drei Bünde in Rhätien*). In the same year, however, Z. became unpopular in the canton by advocating its annexation to the Helvetic Republic established by the French, and his school was in consequence closed. He removed to Aarau, then the seat of government, where he was employed as a commissioner to settle the affairs of Unterwalden, Uri, Schwyz, and Zug, a trust which he discharged with the utmost ability and good temper. The benevolent interest, indeed, which he manifested in the sufferings of the population has made his name memorable as a national benefactor. It would be tedious to enumerate the political and administrative affairs in which Z. was actively engaged after this period; we find him at one time protesting against the arbitrary proceedings of the French, and at another pointing out the prudence of concession, but always taking a course marked by practical sagacity and wisdom. In 1804, he was presented with the citizenship of Aargau and appointed Inspector of Woods and Mines. In the same year, he founded the *Swiss Messenger* (*Schweizerboten*), a publication which rapidly became popular. It was followed by the *Miscellany of the Latest News* (*Miscellen für die neueste Weltkunde*), which was continued down to 1813. In 1811, he added a monthly periodical, the *Erheiterungen*, to these publications. He died at Aarau, June 27, 1848. Z.'s works are very numerous, and are always characterised by sound information, good sense, and a vigorous and effective eloquence. The most important of his historical works, not mentioned above, are *History of the Forest Cantons*, a *History of Bavaria*, a *Popular History of Switzerland*. His novels or tales are more numerous and better known; among the best are *The Creole*, *Alamoniade*, *Jonathan Frock*, *Clementine*, *Oswald*, and *Meister Jordan*. As a poet and play-writer, Z. has less merit. The most popular of all his writings was the *Hours of Devotion*, a Sunday periodical: it supplied a complete exposition of modern rationalism, and yet displayed such zeal and eloquence in the cause of sound morality, that it met with approbation from persons of all creeds. It has gone through 40 German editions, and, with many other works of Z., has been translated into English. A collected edition of the works of Z. was published at Aarau in 1825.—See *Life of Zschokke* by Munch (Haag, 1831).

ZSCHOPPAU, a town of Saxony, in the circle of Zwickau, and about 26 miles east of the town of that name, on the river Zschoppau. It has a castle and two churches; manufactures of hosiery, cloth, lace, &c.; weaving, wool-spinning, dyeworks, bleach-fields. Pop. 7600.

ZUG, the smallest of the Swiss cantons, is about 14 miles in length by 10 in width. It had, in 1860, a pop. of 19,608. The south-eastern part of the canton borders on the Alpine region, and is hilly and pastoral; the north-western part, sloping to the plain of Switzerland, and enclosing a great part

of the Lake of Zug, is a rich and beautiful country of corn-fields and orchards. The chief exports of Z. are dried fruit, cattle, and the products of the dairy. Z. is a representative democracy, all citizens above 19 enjoying the franchise. There are two councils, one consisting of 162 members, which discharges legislative functions, and another consisting of 54 members, which conducts the administration. The inhabitants speak Swiss-German, and are Roman Catholic. The battle of Morgarten, which founded the independence of Switzerland, was fought on the frontier of this canton in 1315; but it was not till 1352 that Z. joined the Swiss Confederation.—Zug, the capital of the canton, has a pop. of from 3000 to 4000.

ZUIDER ZEE, a large gulf penetrating deep into the Netherlands, between $52^{\circ} 26'$ — $53^{\circ} 20'$ N. lat., is about 60 miles in length, and 210 miles in circumference. The islands Texel, Vlieland, Ter Schelling, Ameland, and Schiermonnikoog, reaching in a chain from the most northern point of Holland, are the remains of the former line of coast, which form a breakwater against the North Sea. From Dunkirk in French Flanders to the north of Holland, the interior is defended from the sea by sand-hills or downs. Here, as at the mouth of the Scheldt, the sand-barrier was broken, and the waters overflowing the low lands, separated the province of Friesland from the peninsula of North Holland, and, having united with the small inner lake Flevo, formed the present Zuider Zee. This flood occurred on November 1, 1170.

In the Z. Z., lie the islands Wieringen, Urk, Schokland, and Marken, with a pop. of about 5000 souls. Fishing is the principal industry. The light-tower, on the east point of Marken, stands in $52^{\circ} 27' 37''$ N. lat.; and the inhabitants are a hardy, industrious, and independent people, who live by fishing and exporting meadow-hay. They cling tenaciously to their old customs, and never marry except among themselves. The houses are built on artificial mounds, or 'hills of refuge;' and the island being liable to frequent and heavy floods, few cows or sheep are kept, no gardens or trees planted, the necessaries of life being almost all brought from the mainland.

From the south-east of the Z. Z., a long narrow arm, called the Y (pronounced *J*), runs nearly due west, through the peninsula of Holland, towards the sand-hills which defend the land from the North Sea. A strong sea-dyke and locks are in progress of construction to cut off the Z. Z. from the Y, through which a broad ship-canal is being made between Amsterdam and the North Sea, on which a new harbour is to be formed. As the works proceed, about 15,000 acres of land will be drained, and converted into pastures. There is also a plan devised for dyking in and draining the central portion of the Z. Z., from the mouth of the Yssel to Enkhuisen, by which room would be made for 200,000 inhabitants, and a new province, containing 500,000 acres, added to the Netherlands.

ZU'LU, or AMAZULU, is the name of that portion of the Kaffir race who inhabit Natal and the region north-east of it, until they gradually merge into the mere negro of the east coast, north of the Zambesi. The Kaffir organisation appears to hold an intermediate place between that of the negro and a higher type; and as we go south and west, from the swamps and malaria of Delagoa Bay and Sofala to the more healthy and bracing regions of Natal and Independent Kaffraria, the Kaffir features appear, as it were, to grow more refined—the mouth protrudes less, the lips are less thick, and the nose assimilates more to that of the

European, although the distinguishing type of woolly hair may still continue.

The Z. Kaffir is a far more amiable savage than his brother the Amakoes of the Cape frontier districts. He is less warlike and predatory, more industrious, and far more willing to act in the capacity of a farm-labourer or domestic servant. In language, customs, habits, &c., although certain tribal and local differences occur, yet they may be called common to all the nation, as a Z. Kaffir has no difficulty in understanding a native of British Kaffraria; and his views of a future state, purchase of wives, &c., are pretty similar. The Z. is by nature social, light of heart, and cheerful; his affections are gentle, steady, and enduring; his passions are, however, strong, and called out when in a state of war. He is comparatively chaste; crimes which stain European or Eastern civilisation are unknown to him. He is hospitable and honest, yet greedy and stingy; he is kind to his own family, yet cruel to dumb animals; and whatever the better nature of his impulses may be, yet when his great chief commands war, he is converted into a demon. He is proud, and very easily can distinguish between an English gentleman and the loafing tribe with which too many of our colonies are afflicted. The writer of this article, by the exercise of a little kindness and firmness, has experienced the most utter devotion from individuals of the Kaffir race generally. Their reasoning powers are good, and with an improved education, a Z. rationalist might not disgrace a chair in the Sorbonne.

It is from the Z. country, however, that those terrible tyrants who so long devastated South-eastern Africa, the chiefs Chaka, Dingaan, Moselikatze, &c. issued. The training of their subjects to a peculiar mode of warfare spread desolation and havoc for many years amongst the Betjuana and other tribes of the interior, until eventually these mighty chiefs with their thousands of followers, fighting, like Homer's heroes, hand to hand, armed with stabbing assagais and shields of ox-hide, the colours of which distinguished the different regiments they were formed into, melted away with broken power into comparative insignificance before the terrible rifles of a few hundred emigrant Dutch Boers, who, in their turn, gave way to the energetic action of the British authorities (see NATAL). The Zulus, although they have very often serious intestine wars amongst themselves, yet live on very friendly terms with the Natal colonists, amongst whom a considerable number of refugees from the country east of the Umtingela dwell in peace and safety, and are, in many cases, fast acquiring a comparative independence.

A number of missionary societies of the Wesleyan, American, Norwegian, and Episcopal churches labour amongst these tribes; and considerable interest has lately been felt with regard to Bishop Colenso's peculiar views for the evangelising these heathens, and his Z. is becoming almost as famous as Macaulay's New Zealander.

The Amafengu tribe, now settled along the Cape frontier, are a broken tribe of Zulus, driven far to the south-west by Chaka or Dingaan, then reduced to slavery by the Amakoes Kaffirs, and freed by Sir B. Durban in the Kaffir war of 1834—1835. The principal Z. tribes are the Amazulu, the Amahute, Amazwazi, and Amatabela. The last, under the chief Moselikatze, have emigrated far to the north, where, amongst the mountains which separate the valley of the Limpopo from the basin of the Zambesi, they still issue forth, and carry their depredations as far north as the Lake Nyassa, where they were found by Dr Livingstone three or four years ago. It is almost impossible to give an accurate idea

of the number of those tribes inhabiting south-east Africa: it has been variously estimated from half a million to two millions or more. Of the language spoken by the Z. and other Kaffir tribes, it must be observed that that in use by the Natal and Zululand Kaffirs is much more pure than that spoken by the Kaffirs on the Cape frontier, where Hottentot clicks and vulgar colonial Dutch words have got very much mixed up with it.

ZULULAND. The country lying north-east of the colony of Natal, between its east boundary, the Umtugela and Umzimyati rivers, lat. 29° 10' E., and Delagoa Bay, lat. 26° S., long. 32° 40' E., is generally known under the name of Z., or the Zulu country, inhabited by independent tribes of Zulu Kaffirs, those living in the immediate vicinity of the Natal colony being subjects of the paramount chief Umpanda, and his son Ketchwayo, the successor of the tyrants Chaka and Dingaan. The great coast chain of mountains, which form in the Cape Colony the Stormbergen, and further to the north-east the Kahlamba and Drachenbergen, still continue well defined to the north-east, running parallel to the coast, but 120 miles distant from it, separating the coast region of Z. from the higher plateaux inhabited by the Dutch Boers of the Transvaal Republic, and rising to an average height of 6000 or 7000 feet. East of the Umtugela River, the country spreads out into large, undulating, grassy plains, but sparsely wooded; while towards the foot of the mountains the kloofs afford some excellent timber. The principal rivers are the Umvoluzi or St Lucia River, which enters the sea about 80 miles north-east of the Natal frontier; and the Mapoota and its branches, which drain the north part of the region, and fall into Delagoa Bay. The country along the coast between the St Lucia River and Delagoa Bay is very flat, marshy, and unhealthy. A considerable range of mountains, called the Lebombo, run from the Umvoluzi River almost in a northerly direction to beyond Delagoa Bay, about half way between the coast and the first range we have mentioned, forming a supporting buttress to a plateau of high level, similar to those so common in the Cape Colony and Natal.

This is generally a fertile region, and, as far as the coast-line, is healthy. Sugar, cotton, and other tropical products can be grown as advantageously as in the Natal colony, to which it forms, as it were, an intermediary link between the fever-regions of the east coast and the more healthy climate of Natal and the Cape Colony. The St Lucia River marks the boundary-line beyond which, to the north-east, Europeans cannot live. Although our traders have tolerably well explored the Zulu country, yet no good map of the region exists, and we know very little of its geology or mineral productions. None of the rivers are available for inland navigation, although a large lagoon inside the mouth of the St Lucia River can be ascended for a few miles. The rivers which flow into Delagoa Bay from the north are sluggish streams, often with no perceptible current, and can be ascended a considerable distance. A large quantity of ivory, rhinoceros' horns, hides, &c. are collected in this region by traders from Natal; and cattle, Indian corn, &c. thrive well in the country before the swampy region commences. The principal tribes are all of the Zulu race—the Amasulu inhabiting the region bordering on Natal; the Amahute, Amawazi, &c. the country in the neighbourhood of Delagoa Bay. The Portuguese have a very decayed fort and settlement on Delagoa Bay, garrisoned by a few mulatto soldiers, and carrying on some trade with the natives and Dutch Boers in gunpowder, muskets, calico, &c., in exchange for ivory, horns,

and other native produce; and a contraband one in slaves is also, we fear, winked at by the authorities, as captures are often made along the coast by our cruisers. The Dutch emigrant Boers, who very much require a port on the sea-board of South-east Africa, would long since have seized on Delagoa Bay, if it were not from a wholesome dread of the very unhealthy climate, which appears to affect those stalwart sons of the highlands of South-east Africa more even than it does Europeans or North Americans.

ZUMALA-CARREGUY, DON TOMAS, the most distinguished of the generals who supported the cause of Don Carlos during the Spanish Civil War of 1833—1840, was born in 1789 at Ormaiztegua, in the Biscayan province of Guipuzcoa. Of an aristocratic, though not wealthy family, he was deeply imbued from infancy with royalist sentiments, which gathered strength with increasing years, till they led him, like the Vendean leaders, to sacrifice fortune and life for a prince wholly unworthy of such devotion. At the time of the invasion of the Peninsula by Napoleon, Z. was a student of law at Pampeluna, and like many of the Spanish youth, he deserted his studies to take up arms against the invader, serving in Mina's corps till the close of the war. He afterwards served under Quesada in the 'Army of the Faith'; and on the re-establishment of absolutism, was raised to the rank of colonel, and appointed governor of Ferrol. He displayed excellent administrative qualities; but his decided leaning to the party of the Carlists (though he repelled indignantly all proposals to proclaim Don Carlos king during the life of Ferdinand VII.) becoming known, he was tried by a council of war, and acquitted. In 1832, when the army was purged of all officers suspected of Carlism, Z. was dismissed, and retired to Pampeluna, where he lived in retirement till the death of Ferdinand and the rising of the Basque population called him to head the Carlist insurrection (October 11, 1833). His motley army was without uniform, ill fed, and ill paid; yet the profound esteem in which 'el Tio Tomas' was held by his followers enabled him to maintain an effective discipline. The overwhelming superiority in number of the Christians, however, forced him to adopt a defensive system of tactics; so, holding the command of Biscay and Navarre, and the strongholds of Fuenterrabia and Irun, to assure his retreat into France, if necessary, he kept his opponents at bay, defeated Rodil in the valley of Amescuas (August 1, 1834), routed another force of Christians at Viana (September 7), gained a second victory in the Amescuas Valley in the following spring, completely defeating Valdez, after a battle of four days, and routed Iriarte near Guernica. These brilliant successes of his skilful and devoted partisan flattered the too sanguine and somewhat weak-minded Don Carlos with the hope of speedily seating himself on the throne, rendered him less willing than formerly to be guided by the counsels of Z., and led him to interfere with the latter's schemes, to his own detriment. Accordingly, after another year's successful fighting with the Christians, Z. was ordered to lay siege to Bilbao; but on June 15, 1835, he received a gun-shot wound so severe that he died ten days afterwards. With Z.'s death, all hope of success for the Carlists was extinguished; and though the war dragged on desultorily for some years longer, the result was never doubtful. Z. was as distinguished for generosity and disinterestedness as for fidelity; and so much had he impoverished himself by liberality to his soldiers, that neither his wardrobe nor his treasury supplied the means for his decent interment.—See Henningaen's *Twelve Months' Campaign*

with *Zumala-Carreguy in Navarre and the Basque Provinces* (2 vols., Lond. 1836).

ZÜRICH, a canton on the north-eastern frontier of Switzerland, is drained by the Rhine and its tributaries. Its pop., in 1860, was 266,265. It is traversed by ridges of lofty hills, running north-west and south-east, between which lie three valleys, forming almost its whole surface—those of the Toos, the Glatt, and the Limmat. The Lake of Zürich penetrates Z. for a distance of 26 miles, and connects it with the cantons of Schwyz and St Gall. Z. has not a fertile soil, but it is carefully cultivated. A considerable quantity of corn is raised in the canton, though not enough to supply the wants of the population. Vineyards and orchards are numerous; but the pasture-lands are of much greater importance, and cattle form the chief wealth of the agricultural population. Z. was one of the earliest seats of the cotton manufacture in Europe, and the spinning and weaving of cotton are still prosecuted with great success. The silk manufactures are nearly as important; and more recently, the progress made in the manufacture of railway locomotives and other machinery, has been a cause of some alarm to English engineers. The mechanics of Z. divide their attention between agriculture and manufacturing industry, and are among the most prosperous and best educated working-men in Europe. The government of the canton is a representative democracy—all adult citizens of 20 enjoying the franchise. The great council of 212 members is elected chiefly by the citizens, but to a small extent by its own members. It appoints an executive council of 19 members, which continues to act for six years, and which is presided over by the burgo-master. The chief towns are—Zürich, the capital, and Winterthur (pop. from 5000 to 6000). But there are a large number of populous and thriving villages scattered over the canton, which are now connected by a well-developed railway system.

ZÜRICH, the capital of the canton of the same name, is situated at the point where the Limmat issues from the Lake of Zürich, and unites with its tributary, the Sihl. Its pop. in 1860 was 19,758. It is one of the most prosperous manufacturing and commercial towns of Switzerland; yet the narrow streets and lofty houses of its older quarters, on the high ground east of the river, give it the quaint appearance of a medieval city. There are many interesting old buildings—the most remarkable being the cathedral, erected in the 11th century. The university, the gymnasium, and the school of industry have long enjoyed a high reputation. The town library is extensive; and numerous museums of natural history, &c., indicate the intelligence and cultivated tastes of the population.

ZURUMA, a town of Ecuador, South America, in the dept. of Assuay, on the west slope of the Andes, about 30 miles from the west coast, and 90 south of Guayaquil. It is situated in a mining district—its gold and silver mines having rendered it formerly very populous, but its importance has greatly declined. Pop. about 6000.

ZUTPHEN, a fortified town in the Netherlands, province of Gelderland, is beautifully situated on the right bank of the Yssel, where that river is joined by the Berkel, in a picturesque district of country, chiefly under cultivation, and variegated with abundance of wood. It is one of the oldest towns in the kingdom, but has many elegant modern buildings. The fortifications are promenades, from many points of which lovely prospects are obtained. Z. has an extensive trade in wood, bark, and grain. There are factories for weaving and spinning,

grain, wool, oil, and paper mills, many tanneries, a soap-boiling establishment, and a large carpet-manufactory. The principal building is the Great Church, supposed to have been founded in 1103; it and the Broederkerk (Church of the Brethren) belong to the Reformed Communion; the Roman Catholics, Lutherans, and Baptists have each a church, and the Jews a synagogue. Besides good schools for the ordinary branches of education, there are a grammar-school, school of design, a theatre, and a concert-hall. The town has several charitable institutions for the sick, orphans, and old people; also the provincial lunatic asylum, which can receive 220 patients. On the 1st of January 1866, pop. 15,304.

At Ryssel, a village near Z., is a reformatory, called the Netherlands Mettray, in which a number of boys are educated, taught farm-labour, and various handicrafts. On the 25th of May 1866, they amounted to 149. Since 1851, when the colony was founded, 117 have been withdrawn by their parents, and 204 placed in situations by the directors: Farm-labourers, 54; gardeners, 61; joiners, 14; smiths, 6; house-painters, 2; shoemakers, 8; tailors, 9; bakers, 6; carrier, 1; bricklayer, 1; miller, 1; house-servants, 3; seamen, 11; soldiers, 21; office-clerks, 4; assistant-teacher, 1; photographer, 1. The reformatory is maintained from annual contributions, legacies, and a small sum charged for each boy. The legacies received during 1865 amounted to £595; gifts for the buildings, £104; contributions, £1222; for the boys, £1024; and from the produce of the farm and garden, £433.

ZVENIGORODKA, an old town of Russia, government of Kiev, on the Tkritsch, a tributary of the Bug, about 98 miles south of the town of Kiev. Pop. 10,010. The trade and manufactures are not worthy of notice.

ZVO'RNİK, a town of European Turkey, in the province of Bosnia, on a narrow strip of land on the left bank of the Drina, about 60 miles north-east of Bosna-Seral. The town is strongly fortified, standing on the face of a steep hill, at the summit of which is a strong fortress commanding the valley of the Drina. It has several mosques, Greek and Roman Catholic churches, lead mines, and a considerable trade in timber. Pop. about 12,000.

ZWEI'BRÜCKEN. See DEUX-POINTE.

ZWICKAU, a picturesque, irregularly-built, ancient-looking town of Saxony, in a pleasant valley on the left bank of the Mulde, 60 miles south-west of Dresden. The river is crossed here by three bridges. The town is the capital of the circle of Zwickau, and is the seat of a district court, court of appeal, and other public offices. Of its churches, the most noteworthy is that of St Mary, the finest Gothic edifice in the Erzgebirge, dating from 1453, distinguished by its tall tower, from which an extensive view can be obtained; it contains a very fine altar-piece by the old German master Wohlgenuth, and other interesting works of art. There are also a splendid court-house and exchange; a cloth hall, a district infirmary; a gymnasium, with a library of 20,000 vols.; a burgher, Catholic, trade, and other schools; an old castle, which has been converted into a workhouse. The town is prosperous, and the population increasing. There are cloth manufactories, breweries, dye-works, chemical works, tanneries, oil and saw mills. The chief source of its wealth, however, and that of the neighbouring villages, are the rich beds of coal in the surrounding district. There are also large iron-works in the neighbourhood. The town is connected by railway with Leipzig, Dresden, and other important places, and has a considerable transit trade. Pop. (1864) 22,432.

ZWINGLI, **ULRICH**, one of the most important of the reformers, was born 1st January 1484, at Wildhaus, in the canton of St Gall, Switzerland, and was one of eight sons of the *amtman* of that place. He studied first at Bern; then at the university of Vienna, where he devoted himself to philosophy; and afterwards at Basel, where, under Wyttenbach, he directed his attention to theology. He became pastor in 1506 in Glarus. At this time, his studies were chiefly directed to the Latin classics and the church Fathers; but having begun to learn Greek in 1513, he from that time devoted himself to the New Testament. He wrote out the Epistles of Paul in the original language, and learned them by heart, which was of great service to him afterwards in his disputations. In the capacity of army chaplain, he attended the campaigns in Lombardy of the inhabitants of Glarus for the pope against the French, in 1512, 1513, and 1515, for which service he received a pension from the pope till 1517. In 1516, the liberal-minded administrator, Geroldseck, invited him to be preacher in the convent of Maria-Einsiedeln, famous for its pilgrimages. Here Z. began to preach against many abuses prevailing in the church; he also called on the bishops of Sitten and Constance to bestir themselves for the improvement of the church under the guidance of the Word of God. So little was he then suspected, that the papal legate, Antonio Pulci, conferred on him, in 1518, the diploma of chaplain to the Holy See. He was soon afterwards called to Zürich; and he entered on his office as pastor in the great cathedral there, 1st January 1519, with a discourse, in which he declared himself for the pure gospel unfettered by glosses. In this office, to which was joined in 1521 that of canon in the cathedral, he laid the foundation of his subsequent work as reformer. The same cause that had stirred Luther into activity gave the impulse to Zwingli. In 1518, Bernardin Samson, a Franciscan from Milan, came to Switzerland for the purpose of selling indulgences for the benefit of the papal court. Z., who was still in Einsiedeln on Samson's first appearance, opposed him both there and afterwards in Zürich with the whole force of his pulpit eloquence, and succeeded so well that Samson was not allowed to enter the town of Zürich. From this time, Z., although attacked by the monks and many of his brother canons, advanced with rapid steps in his reforming career; for the magistracy of Zürich supported his measures to such a degree that, as early as 1520, they issued an order throughout their jurisdiction that the Word of God should be taught without human additions. In 1522, the Reformation was formally established in Zürich. At this time, Z. wrote his first book against the *fasts* of the Roman Church; he also began to study the Hebrew language. The offers of high promotion made to him by Adrian VI. could not make him waver. In January 1523, the government of Zürich invited all theologians disposed to enter the lists with Z. to a conference at Zürich, which was attended by 600 clergy and laity. Z. had arranged the articles of faith, to the number of 67, which were to be the subject of the conference, and defended them so ably against the attacks of the celebrated Joh. Faber, afterwards Bishop of Vienna, that the council of Zürich declared in favour of Z.'s doctrines, and upheld him and his assistants in adhering to them. The second disputation, October 1523, at which Z., before more than 900 people, spoke against the worship of images and the mass, was the cause of the removal of all pictures and statues from the churches of the city of Zürich and its jurisdiction; and this was followed, in 1524, by the abolition of the mass. In the same year, Z. entered into the

married state with Anna Rheinhard, aged 43, the widow of a nobleman of the name of Meyer von Knonow. In the following year, he published his creed, *Von der wahren und falschen Religion* (Of the True and False Religion). He had thus, in a few years, placed the work of reformation in his native land on a solid footing. He now pressed zealously forward in the same course; while the magistracy of Zürich, who all along actively supported him, abolished the begging friars, brought matters relating to marriage before the secular courts, and instituted a better management of church property. On a great many points, Z. was at one with Luther and the other German reformers; only, in regard to liturgical matters, he carried out his reform more radically according to the Bible, and rejected the dogma of the presence of Christ in the Lord's Supper. In order to heal the breach that had, as early as 1524, broken out between the two parties of the new religion on the latter point, a meeting between the Saxon and Swiss reformers was brought about by Philip, Landgrave of Hesse, at Marburg in 1529. The conference lasted for three days, but little progress was made towards unity of opinion. See SACRAMENTARIAN. In 1531, open war broke out between Zürich on the one side, and the Catholic cantons of Lucerne, Schwyz, Uri, Unterwalden, and Zug on the other; and Z., by command of the council of Zürich, had to take the field with the banner of the canton, which had always been borne by a priest. On the 11th October came the conflict; and as their opponents were more than double in number, and also better led, the Zürichers were beaten, and Z. was among the fallen. His collected works were published in Zürich in 1545, in 4 vols.; a selection, in two vols., appeared in 1819—1821, edited by Usteri and Vögelin.—See Rotermund, *Z.'s Leben* (Brem. 1818); Höttinger, *Huldr. Z. und Seine Zeit* (Zür. 1842).

Of all the reformers, there is none more fitted to excite our love and respect than Zwingli. Fearlessly honest in purpose; with a clear head and eye for the truth; less violent, if less eloquent than Luther; more candid and open-minded, if less systematic and penetrating in spiritual insight than Calvin; he stands before us quite as original, if not as prominent as these reformers. His work was not so great as theirs, his influence not so extended; but his character was quite as genuine, and his labour, in some respects, quite as enduring.

ZWO'LLÉ, the capital of the Netherlands province of Overijssel, is situated on the Zwarte Water, and by the canal called the Willemsvaart has connection with the Yssel. It is one of the finest towns in the kingdom, having many beautiful private and public buildings. Both within and without the gates are pleasant promenades and drives, shaded by large trees. The surrounding country consists of rich meadows and cultivated fields, adorned by pretty country-seats. Z. has three extensive suburbs—Diezenpoorten, Kamperpoorten, and Sassenpoorten. It is most favourably situated for commerce, having, by navigable waters, communication with the provinces around the Zuider Zee, Hanover, England, and other maritime nations. The trade in farm-produce and stock is very great. Principal industries are shipbuilding, tanning leather, rope-spinning, beer-brewing, soap-boiling, weaving calicos and stockings, book and plate printing, making salt, cooperage, and refining sugar. The most important buildings are the Town House, Palace of Justice, and Great Church. There are many excellent charitable institutions; and besides those for the ordinary branches of education, a flourishing grammar-school, in which Pope Adrian VI. was partly educated, and a school of design. Z. has

a cabinet of natural history, a literary and a musical society. Here the poet Rhyndis Feith (1753—1824) was born, and Thomas-à-Kempis lived during 71 years. Between 1815 and 1866, the pop. has increased from 12,870 to 20,448.

ZYGODACTYLA (Gr. yoke-footed), a name given by some naturalists to a section of *Pachydermata*, distinguished by having two principal hoofs upon which the animals walk, so that the foot resembles that of the *Ruminantia*. This section includes only one family, the *Suidæ*.—The term **ZYGODACTYLOUS BIRDS** is often applied, in Ornithology, to those birds which have the toes in pairs, two before and two behind, as most of the *Scansores*, or Climbers (q. v.).

ZYGOPHYLLA 'CEÆ, a natural order of exogenous plants, allied to *Rubiaceæ*, and containing about one hundred known species, herbaceous plants, shrubs, and trees, chiefly natives of subtropical countries. They have opposite, generally pinnated leaves, without stipules. The flowers are solitary, or two or three together; the calyx 4—5-parted; the petals alternate with the calycine segments, and clawed; the stamens twice as many as the petals, generally rising from the back of small hypogynous scales; the ovary simple, 2—5-celled, with two or more ovules in each cell. The fruit is capsular, rarely somewhat fleshy, with four or five angles or wings. The most important genus is *Guaiacum* (q. v.). The abundance of species of *Zygophyllum* and some other genera constitutes one of the most striking features of North African and Arabian deserts. The flowers of *Z. fabago* are employed as a substitute for capers, under the name of *Bean-capers*. Those of *Melianthus major*, a native of the Cape of Good Hope, abound so much in honey, that it is obtained from them for use by merely shaking the branches. The Turks use the seeds of *Peganum harmala* both as a spice and for dyeing red.

ZYMOTIC DISEASES have been already referred to, and the most important of them are mentioned in the article **NOSLOGY**. The class of diseases to which Dr Farr has assigned this now generally accepted term, comprises those which are *epidemic, endemic, and contagious*, as, for example, *fever, small-pox, plague, influenza, cholera, hooping-cough, &c.* As Dr Farr observes: 'The diseases of this class distinguish one country from another, or one year from another; they have formed epochs in chronology; and as Niebuhr has shewn, have influenced not only the fate of cities, such as Athens and Florence, but of empires; they decimate armies and disable fleets; they take the lives of criminals that justice has not condemned; they redouble the dangers of crowded hospitals; they infest the habitations of the poor, and strike the artisan in his strength down from comfort into helpless poverty; they carry away the infant from the mother's

breast, and the old man at the end of life; but their direct eruptions are excessively fatal to men in the prime and vigour of age. They are emphatically called the *morbi populares*.' It must not be assumed, as the origin of the word (*zyme*, the Gr. for a ferment) might lead the reader to infer, that all the so-called zymotic diseases are true fermentations, for the class is intended to comprehend all the principal diseases which have prevailed as *epidemics* or *endemics*, and all those which are *communicable either by human contact or by animals in a state of disease*, as well as the diseases that result from the *scarcity and the deterioration of the necessary kinds of food*, or from *parasitic animals*. The diseases of this class thus arrange themselves into the four orders of *Miasmatic, Æthetic, Dietic, and Parasitic* disorders, of which *fever, syphilis, scurvy, and worms* may be regarded as the types.

Dr Carpenter, in a Memoir on *The Predisposing Causes of Epidemics*, shews that the conditions which give rise to zymotic diseases may be referred to the three following categories: (1.) Conditions which tend to introduce into the system decomposing matter that has been generated in some external source, as, for example, putrescent food, water contaminated by sewage, or other decomposing matters, and air charged with miasmatic emanations. (2.) Conditions which occasion an increased production of decomposing matter in the system itself. The best example of this class of conditions is afforded in the puerperal state (or childbed), in which the tissue of the womb is undergoing rapid disintegration, and the decomposing matters which would be harmless at other times, are now able to act upon the blood of the woman, so as to induce that most fatal of all the zymotic diseases, puerperal fever. (3.) Conditions which obstruct the elimination of the decomposing matter normally or excessively generated within the system, or abnormally introduced into it from without. For example, any obstacle to the elimination of urea or uric acid, carbonic acid, biliary matters, lactic acid, &c., gives rise to as true poisoning as if these substances had been injected into the blood-vessels. The most important of the laws by which zymotic poisons are governed, are noticed in the article **VIRUS**.

The average annual rate of mortality in this country at the present time is nearly 22 per 1000, or 1 in 45 of the population; and the deaths from zymotic diseases vary from 21 to 26 per cent. (or amount to nearly one-fourth) of the total number of deaths. Taken in order of their greatest fatality they would be thus arranged: cholera, typhus and other forms of continued fever, scarlatina, hooping-cough, measles, croup, small-pox, dysentery, and erysipelas—the other diseases being less fatal.—For further information on the subject of this article, the reader is referred to Aitken's *Science and Practice of Medicine*.

SUPPLEMENT.

ABBEVILLE, a fortified town of France, in the dep. of Somme, stands on the river Somme, about 12 miles from its mouth, and 90 miles north-by-west of Paris. The town is built partly on an island, and partly on the banks of the river; the streets are narrow and ill paved, and the houses built mostly of brick and wood. The building most worthy of notice is the Church of St Wolfran, commenced in the reign of Louis XII., whose façade is a splendid example of the Flamboyant style, being pierced by three deep portals, and surmounted by three high Gothic towers. The chief manufactures of A. are velvets, serges, cottons, linens, sacking, hosiery, jewellery, soap, glass-wares, glue, paper, &c. It is a station on the Railway du Nord, and is connected by canals with Amiens, Paris, Lille, and Belgium. Vessels of between 200 and 300 tons can sail up the Somme as far as Abbeville. Pop. (1866) 18,042.

ABBIA'TÈ-GRASSO, a town of Italy, in the province of Milan, 14 miles west-south-west from Milan city, on the Canal di Bereguardo. It has silk manufactures. Pop. 9177.

ABEOKUTA, a city, or rather collection of small towns or villages, capital of the province of Egba, in the kingdom of Yoruba, on the west coast of Africa. A. is about 80 miles, by the river Ogun, north of Lagos (on the Bight of Benin), and 240 miles west of the Lower Niger. It is situated 567 feet above the sea-level, on an undulating plain, fantastically broken by masses of gray granite, and covered with bush. Looking down on the city from a height, Burton says: 'The scene before me wants neither grandeur nor beauty; there is a gorgeous growth around—hill, water, forest, and homestead all are present. . . . The primeval forest has been cleared away around the town, yet there is not a vestige of cultivation; and if you ask for the farms, you are told that they are distant some 5 to 20 miles. The reason is that, if placed within reach, nothing could defend them from the depredations of robbers and cattle.' A. is surrounded by a wall of hardened mud, from 18 to 20 miles in circumference, between 5 and 6 feet high, without embrasure, and pierced here and there 'with an aperture by way of loopholes.' The town itself, Burton found to measure 4 miles by 2. The houses are square, and built of mud, with tall roofs of thatch; the streets are narrow and irregular, and the only scavengers are the sun, the vulture, and the pig. There are a few European traders and missionaries; the success of the latter, according to Burton, not having been extraordinary. There is a trade in palm-oil and grain. Pop. estimated at 150,000.—For further interesting details, see R. F. Burton's *Abeokuta and the Camaroons Mountains* (1863).

ABERA'VON, or **PORT TALBOT**, a parliamentary and municipal borough on the south coast of Wales, in Glamorganshire, near the mouth of the Avon, about 30 miles west of Cardiff. It is beauti-

fully situated near the valley of Cwm Avon, in which are extensive mining-works belonging to the Bank of England. The town has a good harbour and docks, is a station on the South Wales Railway, and communicates regularly with Bristol by steamers. The valley of the Avon is shut in by lofty hills, while every available space is occupied by copper and iron works. There is a stone bridge of one arch over the river. A. imports ore from Cornwall; and exports copper, tin, and coal. Along with Swansea, Neath, &c., it returns one member to parliament. Pop. of parliamentary borough (1861) 7754.

ABERGAVENNY (the Roman *Gobanium*), a market-town of England, in Monmouthshire, 13 miles west of Monmouth, is beautifully situated in the valley of the Usk (the garden of Wales), at the junction of the Usk and Gavenny, and is surrounded on every side by high mountains and thick woods. The town is regularly and compactly built, and many improvements have of late years been made. St Mary's Church, which was once a fine cruciform structure, and contains many interesting monuments, has been spoiled by alterations. The castle, which is very ancient, is now a ruin. The principal modern building is the lunatic asylum. There are collieries and iron-works in the neighbourhood. The Hereford and Tredegar Railway passes near the town. Pop. (1861) 4621.

A'BINGTON, a township of Massachusetts, U. S., 20 miles south-east of Boston, with a population, in 1860, of 8527, engaged in the manufacture of boots, shoes, and nails.

ABOMEY. See **DAHOMEY**.

ABORTION is the term used in Medicine to denote the expulsion of the product of conception (the impregnated ovum) from the womb before the sixth month of pregnancy. If the expulsion takes place after that date, and before the proper time, it is termed a *premature labour* or *miscarriage*. In law, no such distinction is made. The frequency of abortion as compared with normal pregnancy is very differently estimated by different writers; but the best evidence leads us to the belief that abortion is of far more common occurrence than is generally supposed, and that it takes place on an average in one out of every three or four cases of pregnancy. The following are amongst the *causes predisposing* to this accident: (1) A diseased condition of either parent, and especially a syphilitic taint. (2) A peculiar temperament on the part of the mother. Those women who present a strongly-marked nervous or sanguine temperament seem to abort with singular facility; and the same tendency is observed in those in whom the catamenial or monthly discharge is abundant or excessive. Again, very fat women, while they have a tendency to sterility, are liable to abort when pregnancy does occur. Any cause interfering with the normal oxidation of the blood—as, for instance, the constant breathing of impure air, may provoke abortion—a fact excellently illustrated by the experiments of Brown-Sequard on pregnant

animals (rabbits), when he shewed that the application of a ligature to the windpipe excited uterine contractions, ending, if the experiment were continued long enough, in abortion, but ceasing if air was freely readmitted into the lungs. Change of climate, as from India to England, certainly predisposes to this accident; and it has been observed by various writers that great political events, the horrors of war, and famine, exert a similar action. The marvellous events that occurred in Paris in 1848 were speedily followed by an extraordinary number of abortions and of still-born children; and a similar fact had been previously noticed by the elder Nagele and Hoffmann during the famine of 1816 and during the siege of Leyden. Nor can there be a doubt that, amongst the causes predisposing to abortion, must be included the employment of such corsets and other garments as by their tightness interfere with the circulation of the blood, and alter the natural position of the womb and of the abdominal viscera. Many diseases supervening during the course of pregnancy, especially the eruptive fevers (as small-pox, scarlatina, &c.), almost invariably lead to abortion of a very dangerous character; and it has been known from the time of Hippocrates that intermittent fevers have this effect. Amongst the *direct causes* of abortion may be placed blows on the abdomen, falls, any violent muscular efforts, too long a walk or ride on horseback (indeed, women with a tendency to abort should avoid horseback during pregnancy), a severe mental shock, &c. Moreover, the death of the fetus from any cause is sure to occasion abortion.

The *symptoms* of abortion vary according to the stage of pregnancy at which it is threatened, and according to the exciting cause. Many of these resemble those of congestion of the womb, such as a sensation of weight or painful pressure in the region of the loins or sacrum, extending to the bladder and rectum (with or without Tenesmus, q. v.); these symptoms being aggravated by standing or walking, and being accompanied by chills, accelerated pulse, loss of appetite, and a general feeling of discomfort. A discharge of serous fluid, sometimes slightly tinged with blood, is then observed. The feeling of weight is replaced by pains, leading to the expulsion of the ovum, which, during the first two months, is so small as commonly to escape detection. In more advanced stages of pregnancy, the pains are more severe, the discharge is more abundant, and consists chiefly of blood; and after more or less time, the product of conception escapes either in whole or in part. In the former case, the patient has little further trouble; in the latter, hemorrhage will probably continue, and the parts retained may putrefy, and give rise to serious symptoms. After about the commencement of the fourth month, the symptoms gradually approximate to those presented in ordinary parturition.

In the *treatment* of abortion, prophylactics (or the guarding against causes likely to lead to it) hold the first place. Women liable to this affection should, on the slightest threatening, assume as much as possible the horizontal position, avoiding all bodily exertion or mental excitement. They should use non-stimulating foods and drinks, and keep the bowels open by gentle aperients—such as manna and castor-oil, and carefully avoid aloe and other medicines irritating the lower bowel. Moreover, a separate bed-room must be insisted on by the physician. We shall only enter into the curative treatment so far as to state that if it is deemed necessary to check hemorrhage before professional aid can be called in, cloths soaked in cold water may be applied locally (care being taken to change them before they grow warm), and iced water containing

an astringent, such as a little alum, may be given internally. Further proceedings must be left to the medical attendant.

There are occasional cases (as where the outlet of the pelvis is very contracted) in which it is necessary to induce abortion by professional means, but it would be out of place to enter into this subject in these pages. It cannot be too generally known, that all attempts at procuring criminal abortion, either by the administration of powerful drugs, or the application of instruments, are accompanied with extreme danger to the pregnant woman.

ABOUT, EDMOND FRANÇOIS VALENTIN, a French littérateur of great and rising reputation, was born at Dieuze, on the 14th February 1828. He studied first at the Lycée Charlemagne, where he greatly distinguished himself; and afterwards at the Ecole Normale. In the beginning of 1852, he received an appointment to the French School at Athens, an institution supported by the French government, with no very definite object, but with the hope that the members, who are selected on account of their attainments and promise in scholarship, and left perfectly free to choose their own studies, should be able to make contributions to the history or the archaeology of Greece. A. remained at Athens for about two years. He wrote, as required by the terms of his appointment, a Memoir for the Academy of Inscriptions, entitled *L'île d'Egine*; but it was as the satirist of modern Greece, not as the investigator of Grecian antiquities, that his name first became familiar to the public. On his return to France, towards the end of 1853, he published *La Grèce Contemporaine*, a work which at once attained to great popularity, and was in course of the following year translated into several foreign languages. This work, full of lively and pointed sketches, abounding in shrewd and witty observation, its censures, very severe as they were, scarcely seeming offensive, from the ease and perfect good-humour with which they were conveyed, at once made its author be regarded as among the most promising writers of the day. It unquestionably affected European opinion as to the character and the capabilities of the modern Greeks; the truthfulness of its portraiture being confirmed by all who had special knowledge of this people. It gave earnest of the qualities which go to making a brilliant novelist; and A. did not long delay to come before the public as a novelist. His first novel, *Tolla*, appeared in the *Revue des Deux Mondes*, and was republished early in 1855. It did not disappoint the high expectations formed of it; but the author had laid himself open to a charge which, whenever it can be colourably sustained, is certain to be disastrous. He had taken many of his leading incidents from an Italian work, *Vittoria Savorelli*, published in 1841, and soon after withdrawn, the incidents contained in which were well known as actual occurrences; and though something of this was hinted in the book, there was no distinct acknowledgment of it. A hue and cry of plagiarism was got up against A., from which his reputation took some time to recover. His comedy, *Guillery*, brought out in February 1856 at the Théâtre Français, did not make his peace with the Parisians; it was a complete failure, so far as the theatre-going public was concerned, and had to be withdrawn after two representations. A set of stories which he now began to contribute to the *Moniteur*, however—*Les Mariages de Paris*—had a success which more than made up for the savage criticism which he had had to endure: they placed him high in public favour; and since then, his career has been a series of successes. *Les Mariages de Paris* was followed by *Le Roi des Montagnes* (1856), *Germaine* (1857), *Les Echasses de Maître Pierre*

(1857), and *Trente et Quarante* (1858)—all novels originally contributed to the *Moniteur*.

In 1859, after a tour in Italy, of a portion of which he contributed a description to the *Moniteur*, A. published a political pamphlet—*La Question Romaine*—which, displaying the same qualities as his early work on Greece, but matured, and wielded for a definite object, and being, moreover, regarded as written with the approval of the Emperor of the French, created a sensation throughout Europe. His object was to expose the abuses of the ecclesiastical government at Rome; and numerous answers to his work were made by friends of the papacy. In the following year, he published two political pamphlets, *La Nouvelle Carte d'Europe*, and *La Prusse en 1860*; both of which, being taken as indicative of the Emperor Napoleon's leanings, underwent criticism in all parts of Europe. A second work on Rome—*Rome Contemporaine*—appeared in 1861. M. A.'s political views are imperialist; and he was decorated with the Legion of Honour in 1858.

Of late years, he has been producing novels with unabated popularity; and he has also written several slight dramatic pieces, which have been favourably received. It is unnecessary to put down a catalogue of works which are perfectly familiar to those who are interested in French contemporary fiction. In 1864, he published *Le Progrès*, a work of considerable pretensions, in which he discussed at great length, but with his usual liveliness of style, the existing state of society, especially in France, and the methods of improving it. His conclusion was that in France there were needed for progress the liberty of association (for the purposes of production and trade), an amendment of the land-system, a proper distribution of population as between country and town, the absence of police interference in the affairs of private persons, freedom of religious worship, and other similar conditions. To Englishmen, who have most of these things in some measure already, the book might seem only a collection of common-places neatly put; but in France it led to a good deal of discussion. The most novel part of it, perhaps, was the argument against the subdivision of land which has taken place in France, which, according to M. About, is excessive, and is impoverishing the country.

ABU', a mountain of India, in the territory of Serolie, in Rajpootana, rising far above any other of the Aravulli ridge, and said to be about 5000 feet above the sea. The base is broad, its circuit being estimated at forty or fifty miles; the summit is very irregular, and divided into many peaks. It is a celebrated place of pilgrimage, especially for the Jains, who have a magnificent group of four temples at Dilwara, about the middle of the mountain, one of which is described as 'the most superb of all the temples in India.' Before it, is an equestrian statue of the founder, Bimul Sah, a Jain merchant of Anhulwara. All the temples exhibit symptoms of decay. The summit of A. is about 40 miles north-east from the British cantonment of Deesa, and it has lately begun to be used as a sanatorium.

ACARUS FOLLICULO'RUM is the most generally accepted name for a microscopic parasite residing in the sebaceous sacs and hair-follicles of the human skin. It is also known as the *Demodex folliculorum*, the generic name being derived from the Greek words *demos*, lard, and *ázx*, a boring worm. It was first described by Dr Simon of Berlin in 1842, under the title of *Acarus folliculorum*, which was suggested by the eminent zoologist, Erichsen of Berlin. In the following year, Mr Erasmus Wilson made it the subject of an elaborate

memoir which appeared in the *Philosophical Transactions*, in which, as there are doubts as to its exact zoological position, he simply terms it the *Entozoon folliculorum*. According to Professor Owen, who gave it the name of *Demodex*, it represents the lowest form of the class *Arachnida*, and makes a transition from the *annelids* to the higher *articulata*. As regards the size and form of these animals, there is much variety; they pass their whole existence in the fatty matter of the sebaceous cells, moulting repeatedly during their growth, and being finally expelled from the follicles with the secretions of these organs. Their presence has no reference, according to Mr Wilson, to disease of the skin or of the follicles. They are met with in almost every person, but are most numerous in those in whom the skin is torpid, in invalids, and in the sick. They vary in length from $\frac{1}{16}$ th to $\frac{1}{10}$ th of an inch, and the accompanying figure represents the magnified parasite. Their number is various; in some persons not more than two or three can be found in a follicle, while in others Mr Wilson has seen upwards of fifteen. The head is always directed inwards, and when a number are present they seem to be collected into a conical bundle, the larger end of the cone being formed by their heads. The situation in which they are most commonly found is the skin of the face, and particularly that of the nose, but they have also been met with in the follicles of the back, the breast, and the abdomen. As far as we know, they are never found on the limbs.

A reference to the figure shows that the animal possesses eight thoracic appendages (c, c) of the simplest and most rudimentary kind, each of which is terminated by three short setae. The integument of the abdomen is very finely annulated. The mouth is suctorial or proboscoidiform, consisting of two small spine-shaped maxillae (b), and an extensive labium capable of being elongated or retracted; it is provided on each side with a short, thick, maxillary palp (a, a), consisting of two joints with a narrow, triangular labrum above. The sexes are distinct, but the differences between the male and female are not well recognised. Ova are frequently seen, both in the body of the female and in detached discharged masses. Any of our readers may readily observe their own acar by collecting between two pieces of thin glass the expressed fatty matter from a nasal follicle, and fastening it with a drop of olive oil. Very similar if not identical animals have been found in the contents of the pustules of mangy dogs:

Acarus folliculorum, magnified.

ACAYUCAN, a town of Mexico, a military port, about 100 miles south-south-east of Vera Cruz, having trade in cochineal. Pop. 6000.

ACCRINGTON, a manufacturing town of England, in Lancashire, which has recently increased much in size and importance, lies in a deep valley, surrounded by hills, about 34 miles north-east of Liverpool, and 13 miles east of Preston, on the banks of a small stream, the Hindburn. Pop. (1851) 7481; (1861) 13,872. Christ Church is a fine Gothic building, erected in 1838. The inhabitants are mostly employed in cotton factories, weaving, and calico-printing. A. is considered the centre of the cotton-printing business. There are coal-mines in the neighbourhood, in which many of the inhabitants find employment. It is a station on the Lancashire and Yorkshire Railway.—OLD ACCRINGTON is an adjacent chapelry, also with cotton manufactures.

ACERRA (anc. *Acerræ*), a town in South Italy, in the province of Caserta, nine miles north-east of Naples, with which it is connected by railway. It was once fortified, but the walls are now crumbling into ruins. It has a cathedral and seminary. The country around is fertile, but extremely unhealthy, being afflicted with malaria, caused partly by the sluggish artificial channels called the Regj Lagni, the representatives of the *Clanlus non æquus Acerris* of Virgil; and partly by the flax-grounds, where the stalks are left to macerate. Pop. (1861) 11,717.

ACETAL ($C_{12}H_{14}O_4$) is a colourless liquid, of an agreeable odour, and a flavour said to resemble that of the hazel-nut. It is one of the products of the slow oxidation of alcohol under the influence of finely-divided platinum, or of chlorine, or of dilute sulphuric acid and peroxide of manganese. Its specific gravity is 0.821, and it boils at 221°. It yields various reactions and products of interest in organic chemistry.

ACETIFICATION. Since the article ACETIC ACID was written, a totally new view has been adopted regarding the process by which wine, beer, cider, and alcoholic fluids generally become converted into acetic acid, when they are exposed to the action of the air, and especially in hot weather. The views held by Liebig regarding the part that wood-shavings, sand, ash, &c. play in condensing oxygen, and transmitting it to the alcohol, are now supplanted by those of Pasteur, who maintains that the true acetifying matter is a very minute mycoderma—a special vegetable organised being. It is impossible to conceive a more simple form of vegetation, consisting of extremely minute spores arranged in chains; each spore having a mean diameter not exceeding $\frac{1}{1000}$ th of an inch, and the length being about twice as great. The rapidity of the development of these spores, under favourable circumstances, is almost inconceivable; and the power which they possess in fixing the oxygen of the air, and of transmitting it to the alcohol, and of establishing an incomplete combustion of the latter, is no less wonderful. A surface of a square yard covered with this plant, is able, in the course of 24 hours, to fix the oxygen of more than 1000 quarts of air. The temperature of the surface of the fluid at which this slow combustion is proceeding is considerably raised, and often remains for several days at 21° or 25° above that of the surrounding air. The process which has just been described bears a very close analogy to the respiratory process, the oxygen of the air being in one case fixed by minute vegetable cells, and in the other by the blood corpuscles.

A CETYL ($C_{24}H_{48}O_2$), known also under the names *Acetoxyyl* and *Othyl*, is an organic radical not yet isolated, but which is supposed to exist in acetic acid and its derivatives; the rational formula for acetic acid being on this hypothesis $C_2H_3O_2 \left\{ \begin{array}{l} H \\ O_2 \end{array} \right.$

See TYPES, CHEMICAL. The reason for assuming the existence of this radical in the acetic compounds is, that the formula to which it leads affords the simplest explanation of the most important reactions of acetic acid. Thus, when acetic acid is treated with a metallic oxide or hydrate, the basic atom of hydrogen is replaced by a metal, and an acetate of the metal $C_2H_3O_2 \left\{ \begin{array}{l} M \\ O_2 \end{array} \right.$ is produced.

The term *acetyl* was formerly applied to the radical C_2H_3 , and the anhydrous acid was regarded as a binoxide of this radical. Hence the two other names for the subject of this article—the former suggested by Kolbe, and the latter (an abbreviation of oxygen-ethyl) by Williamson.

ACHALGA'NJ, a town of British India, in the territory of Oude, and district of Bainswarra, four miles north-east from the Ganges, in N. lat. 26° 25', and E. long. 80° 35'. Pop. 5000, of whom 500 are Mohammedans, and the rest Hindus.

A'CHORÉES are one of the forms of pustules—viz., that in which the pustules are very small, but have large inflamed bases. They are most common on the faces of children, and their secretion forms those large, thick, irregular scabs, resembling dried honey, which are so common on children's chins. They seem to be inflamed hair sacs or sebaceous follicles. Their treatment is the same as that for Impetigo (q. v.).

A'CNÉ (probably from Gr. *akme*, an efflorescence) is an important skin disease. It is placed by some dermatologists in the order *Pustula*, and by others in the order *Tubercula*, which includes solid, hard elevations of the skin, much larger than *Papula*. The sebaceous follicles of the Skin (q. v.) are the primary seat of the affection. Their natural secretion accumulates in their interior, and there is, at the same time, a tendency to inflammation of the follicle and surrounding tissue. It is by no means rare to find on the face and shoulders of young persons about or above the age of puberty a number of black spots, each of which is placed on a slightly-raised pale base. These black points are called *comedones*. Pressure at the base occasions the expulsion of a little, elongated, spiral, white mass, with a black point or anterior end, commonly but erroneously regarded as a worm.* Interspersed are other spots, with the base more raised and inflamed, which become more or less perfect pustules, each of which rests on a comparatively large red base. In some of the inflamed follicles, coagulated lymph (to use the old phraseology) is thrown out, and a small hardened mass is the result. According as one or other of these appearances preponderates, we have different varieties of this disease. When the pustule is the most striking feature, the affection is called *Acne simplex* or *vulgaris*; when the black points abound, it is *Acne punctata*; and when there is decided induration, it is *Acne indurata*. We have already mentioned the age at which this affection commonly occurs: it is never seen in children, and is rare in aged persons.

As long as there is no inflammation, the treatment simply aims at favouring the escape of the contents of the sebaceous follicles, by rubbing the face and other affected parts with cold cream at bedtime, washing on the next morning with soap and water, and gentle subsequent friction with a soft towel. When acute inflammation is present, and the pustules are very tender, there is no better application than tepid water, with or without a little gelatine in solution; and subsequently the ointment of the hypochlorite of sulphur has been found useful by Wilson and others. *Acne indurata*, which is the least tractable of the three forms, is sometimes benefited by the application of fly-blisters. In all these cases, the state of the digestive organs must be carefully attended to.

Acne Rosacea is, according to some writers, a much more grave variety of acne; while others regard it as a special disease, to which they assign the name of *Rosacea*, under which term it is described in this work.

ACQUAVIVA, a town of South Italy, in the province of Bari, 16 miles south of the town of Bari, in a healthy situation at the foot of the Apennines. It is surrounded with walls and ditches, has a

* In the midst of the white mass of sebaceous matter, a parasite, *Acarus folliculorum* (q. v. in SUPPLEMENT), is, however, often found.

handsome parish church, several convents, two hospitals, &c. Pop. 6776.

A'CRI, a town of South Italy, in the province of Cosenza, 13 miles north-east of the town of Cosenza, in a beautiful and healthy situation, with a fertile country around. Pop. (1861) 11,977.

ACRITICHO'MACY (Gr. *akritos* and *chromatia*, which, when associated, imply 'inability to discriminate between colours') is a term which seems likely to supersede *Colour Blindness*, *Daltonism*, *Achromatopsia*, &c.

A'CROLEIN ($C_8H_8O_2$) is a colourless, limpid, strongly refracting liquid, lighter than water, and having its boiling-point at about 125° . It constitutes the acrid principle produced by the destructive distillation of fatty bodies, and is in part due to the decomposition of glycerine. It is best prepared by distilling a mixture of glycerine and anhydrous phosphoric acid, the object of the latter being to effect the removal of the element of four atoms of water from the glycerine ($C_3H_5O_3$), which contains the elements of acrolein ($C_3H_4O_2$) + those of four atoms of water (H_4O_4). In its state of vapour, it is extremely irritating to the eyes, nostrils, and respiratory organs—a property to which it owes its name. The pungent smell given off by the smouldering wick of a candle just blown out is due to the presence of acrolein. When mixed with a solution of potash or soda, the irritating odour disappears, and is replaced by one of cinnamon; while a brown resinous substance is formed; and certain oxidising agents, as oxide of silver, convert it into *acrylic acid* ($C_3H_4O_2$).

A'CU'PRESSURE, a mode of arresting hæmorrhage from cut arteries. It is based on the principle of temporary metallic compression, and was first suggested to the scientific world by Sir James Y. Simpson, Bart., in a paper read before the Royal Society of Edinburgh, December 1859. The simplest mode of practising it may be thus described: The needle is passed through the flaps or sides of the wound, so as to cross over and compress the orifice of the bleeding artery, just as in putting a flower in the lapel of one's coat, one crosses over and compresses the flower-stalk with a pin pushed twice through the lapel. The middle portion of the needle—the only part of it which is in immediate contact with the fresh surface of the wound—bridges over and compresses the artery at its bleeding orifice, or perhaps a line or two more on its cardiac side. The head and point of the needle are

First Method.

exposed externally on the cutaneous surface of the flap or side of the wound. 'When passing the needle in this method,' says Sir J. Y. Simpson, 'the surgeon usually places the point of his left forefinger or of his thumb upon the mouth of the bleeding vessel, and with his right hand introduces the needle from the cutaneous surface, and passes it right through the whole thickness of the flap till its point projects for a couple of lines or so from the surface of the wound, a little to the right side of the tube of the vessel. Then, by forcibly inclining the head of the

needle towards his right, he brings the projecting portion of its point firmly down upon the site of the vessel; and after seeing that it thus quite shuts the artery, he makes it re-enter the flap as near as possible to the left side of the vessel, and pushes on the needle till its point comes out again at the cutaneous surface. In this mode, we use the cutaneous walls and component substance of the flap as a resisting medium, against which we compress and close the arterial tube. But in some wounds, a neighbouring bone or other firm unyielding texture forms the best and readiest point of resistance against which to pin and compress the artery by the acupressure needle.'

This is the first and simplest mode of applying acupressure. Six other methods, however, have been suggested; and as each of them has its peculiar appropriateness as a hæmostatic agent, it will be proper to enumerate and describe them. The appliances which these other methods require are—a pin with a glass head, to admit of sufficient pressure for introduction; a needle threaded with iron wire; and a loop of inelastic iron wire, 5 or 6 inches in length. The pins and needles should be of various sizes, and they should also be bayonet-pointed; the latter form being superior to the spear-pointed, as facilitating introduction, and as being less apt to cut the tissues.

Second mode: The needle is inserted in the fresh surface at a little distance from the vessel; it is pushed on, causing its point to rise up as near the artery as possible; it then bridges over and compresses the artery; then its point is made to dip into the raw surface of the wound on the other side of the vessel; finally, it is forced on until it emerges a second time on the wound. The passive or elastic iron wire with which it is threaded enables it to be easily withdrawn. Third mode: The needle is entered on

Third Method.

one side of the artery; is pushed behind so that its point emerges on the opposite side of the vessel; a loop of inelastic wire is then passed over its point, so as to bring the wire over the track of the artery and behind the stem of the eye-end of the needle; finally, the wire is drawn sufficiently to close the vessel, and is fixed by a twist or half a twist round the needle. The needle may again be withdrawn by the wire which threads it. Fourth mode: This differs from the third only in substituting a long pin with a glass head for the acupressure needle threaded with iron wire. The pin is preferred to the wire-threaded needle, as avoiding entanglement with the wire, and consequent pain in withdrawing the needle. Fifth mode: This, which, from its inventor, Dr Knowles, formerly house-surgeon of the Aberdeen Hospital, is also called the Aberdeen mode, has two varieties, which differ from each other only in the extent of the rotation given to the instrument by which the twist is effected. In the former variety, the instrument undergoes a half; in the latter, it undergoes a quarter, rotation of a circle. In either case, a threaded needle only, or a long pin only, is required. In the former, the instrument is inserted some lines to one side of the bleeding artery, and passed behind it; its point is then made

to emerge on the surface of the wound a few lines on the other side of the vessel. Then the needle (or pin) is twisted half a rotation, so as to bring its head to the side where its point was before making the twist—the instrument being now above instead of below the artery, and pressed well down upon it. Finally, the point of the instrument is pushed into the tissues beyond the artery, so as to secure it in the proper position, and retain the twist. The latter (and preferable) variety requires only a quarter-rotation to be given to the acupressing instrument. First, the needle (or pin) is entered on one side of the bleeding artery; then pressed onward a few lines in the same direction as the length of the vessel, so that its point emerges on the surface of the wound. Secondly, a quarter-rotation is given to it, so as to place it above the artery; and it is well pressed down against the small portion of tissues between the instrument and the vessel. Thirdly, the instrument is secured, and the twist retained by sending the point into the tissues beyond the artery. Sixth mode: This was devised by Dr Keith of Aberdeen, and requires a long pin with a duplicature of passive iron wire. The point of the pin is inserted a few lines from the artery; passed below or by the side of it; and afterwards pushed on so as to make the point emerge a few lines beyond the bleeding mouth. The duplicature of iron wire is then thrown over the point of the pin; then the two ends are crossed behind the stem of the pin, so as to take the bleeding mouth between them. The ends of the wire are then pulled tightly enough to stop the hæmorrhage; then brought forward by the sides of the pin (one on each side), and finally fixed by a half-twist in front of the pin, and close down upon it. Seventh mode: In this, a long needle is passed through the cutaneous surface pretty deep into the

Seventh Method.

soft tissues, at some distance from the vessel to be compressed; then it is made to emerge near the vessel; then it bridges over and compresses the artery; then it is dipped into the soft parts on the opposite side of the vessel; and finally, its point is brought out a second time through the common integument.

The advantages of acupressure as a hæmostatic agent (though not yet universally recognised, and indeed strongly denied by some practitioners) have seemed to many eminent surgeons to be these: first, it is not only the easiest of application, but it is the quickest mode yet devised for arresting hæmorrhage; second, this abridgment of the time required for arresting hæmorrhage, lessens the risk of suppuration, and other effects of the higher grades of inflammation in the stump; third, it causes no condition which must be followed by suppuration, whereas the use of the ligature has never been known to obtain immediate union, or union by primary adhesion, without the formation of pus; fourth, it has never been followed by pyæmia—a constant and distressing result in the case of the ligature; fifth, the presence of a foreign body in the wound—always a source of irritation—is of much

shorter duration in the case of the needle than of the ligature, while the former does not divide and strangle the arterial coats, like the latter; sixth, the patient on whom acupressure has been practised is comforted by the assurance, that in a very few hours after the operation, all foreign matter will be removed from the wound—a consolation which he never enjoyed with the ligature.—*Proceedings of the Royal Society of Edinburgh*, vol. iv. p. 249; *Edinburgh Medical Journal*, January 1860; *Medical Times and Gazette*, February 11, 1860; *Acupressure*, 1 vol. 8vo, by Sir J. Y. Simpson (Edin. 1865); and *A Practical Treatise on Acupressure*, by Mr Pirrie and Dr Keith (Lond. 1867).

ADA, a town of the Austrian Empire, in the Woivodena, eight miles south of Zenta. Pop. 8200.

ADAFU'DIA, a town of the Felattah country, West Africa, about 400 miles south-east from Timbuktu, in about 13° 6' N. lat., and 1° 3' E. long. It is situated in a dry, healthy, and fertile plain, and is surrounded by a mud wall. Pop. supposed to be about 24,000. A large trade is carried on, and slaves form a principal part of the merchandise.

ADAMNAN, SAINT, a member of the early Irish Church, to whom the world is deeply indebted for the information about that remarkable community which he left to posterity. His name was properly Adam, of which Adamnan is a diminutive. It is one of the peculiarities of that early church that the genealogies of its eminent members have been preserved with a minuteness scarcely rivalled in the days of peerage. He was born in the county of Donegal about the year 625. In the words of Dr Reeves: 'His father, Ronan, was sixth in descent from Conall Gulban, the head of one of the two great races of the Northern Hy Neill, and in virtue of his birth, claimed kin to St Columba and many of the sovereigns of Ireland. The father of Ronan was Tinne, from whom came the patronymic *Ua Tinne*, or grandson of Tinne, an appellative which is occasionally found coupled with A.'s name. Ronnat, the mother of A., was descended from Enna, a son of Niall, whose race, the Cincl Enna, possessed themselves of the tract lying between the channels of the Foyle and Swilly, which was called the Tir Enna, or land of Enna, and answers to the modern barony of Raphoe.' He was, like many of the eminent Irish clergy, a statesman as well as an ecclesiastic, and we hear of his being sent on missions from his own people to Alfred, king of Northumbria. In the year 679, he was elected Abbot of Iona. His rule over that community was not, however, destined to be peaceful and fortunate. The views held by the Irish Church about the holding of Easter and the form of the tonsure are now pretty well known as a chapter in the history of the church. However little their own importance might be, they are significant as the object of a bitter contest in which that church resisted the rules promulgated from Rome. In his intercourse with the Saxon Church, A. had adopted the Romish or orthodox views, as they are termed, and endeavoured to put them in practice in his own community. He was thwarted in this object, and it is said that mortification at the failure caused his death. He died in the year 704, on the 23d of September, which is the day of his translation in the calendar. He left behind him an account of the Holy Land, containing matters which he says were communicated by Arculfus, a French ecclesiastic who had lived in Jerusalem. It is valuable as the earliest information we possess of Palestine in the early ages of Christianity. But far more valuable is his *Vita Sancti Columbae*, his Life of St Columba, the converter of the Picts, and founder of Iona. Along with miracles and many

other stories palpably incredible, this book reveals a great deal of distinct and minute matter concerning the remarkable body to which both the author and his hero belonged. There are several editions of the book, but all others are now superseded by that of Dr Reeves, edited in 1857 for the Bannatyne Society of Edinburgh, and the Irish Archaeological Society. Nearly all the information to be had about the early Scoto-Irish Church is comprised in that volume.

ADENITIS AND ANGEIOLEUCITIS are the terms employed in medicine to indicate inflammation of the lymphatic glands and inflammation of the lymphatic vessels respectively. In most instances of inflammation in the absorbent or lymphatic system, the vessels and glands are simultaneously involved. Although there is plenty of evidence, from the examination of the dead body, that inflammation of the lymphatics may occur internally, it is only observed in the living subject in connection with the skin or an ulcerated surface. The disease usually originates in an open wound of almost any form, as a puncture, a cut, or a blister. This wound is directly infected by some morbid matter, as, for example, some local inflammatory product, such as the putrid secretion of a sore; but more commonly by some irritating or poisonous matter from without, or some gaseous matter. The inflammation that is thus set up in the lymphatics always extends upwards from the wound, and may be traced by lines of redness following the course of these vessels, and not of the veins, and terminating where the inflamed vessels enter a gland. In the arm, for example, they never pass the armpit, in which the axillary glands lie. The tenderness along these inflamed tracts is excessive, and extends to the next gland, which appears to arrest the further progress of the poisoned lymph, by becoming itself inflamed. The degree of inflammation of the gland may vary from slight enlargement with tenderness on pressure, to profuse suppuration. The suppuration may not take place till a week or more after the inflammation of the vessels has subsided, and may excite no rigors or other constitutional symptoms; and a patient may be quite unconscious that there is anything serious the matter with him, when half a pint or more of matter may be collecting in and around a gland in the armpit. The constitutional symptoms attending an attack of acute inflammation of the lymphatic vessels (*angiopleucitis*) are often severe, and are thus summed up by Mr Moore in his essay 'On Diseases of the Absorbent System' in Holmes's *System of Surgery*: 'Rigors, nausea, and vomiting, heat of skin, thirst, dryness and coating of the tongue, with constipation, sleeplessness, and a feeling of languor, are usually the severest accompaniments of the disease. If the fever be typhoid, if there be profuse fetid sweats, severe muscular pains, high excitement, or dry burning heat of the skin, and marked delirium, the poison is no longer limited within the lymphatic channels, but has infiltrated the cellular tissues, and has tainted the blood. As the inflammation subsides, a cutaneous eruption or fetid discharge from the bowels comes on, and the general symptoms become those of exhaustion.'

The following observations on the treatment of inflamed absorbents are mainly taken from Mr Moore's essay. Many of the ordinary duties of life perpetually expose manual labourers and others to this painful affection. In the way of prevention, the practice of smearing the hands with oil or grease before touching noxious fluids, is found to prevent the mischief which might arise from absorption by a cut or sore, and is a useful precaution in dissection and in post-mortem examinations; and there can be no doubt that the timely application

of a layer of collodion or of court-plaster might avert many attacks of inflamed absorbents. When symptoms of this form of inflammation supervene, the wound should be thoroughly cleansed, by being laid more open, if all its parts are not freely exposed, and then put under a stream of water, syringed, or soaked in a hot bath, as may seem most suitable. If recent or punctured, it should be sucked, and then freely touched with a pencil of nitrate of silver. If flabby, it should be treated with a stimulating lotion of sulphate of zinc or of copper; if fetid, it should be wrapped in a solution of Condry's Fluid, or in chlorinated lotions; and if sloughy, it should be covered with Peruvian balsam and a poultice of linseed meal, charcoal, or yeast. A warm poultice of one of these kinds, frequently changed, is usually the most soothing application. At the same time, nitrate of silver should be two or three times drawn along the red tender lines indicating the course of the lymphatics, after which the arm should be enveloped in cotton-wool; and perfect rest in a comfortable position enjoined. Due attention must at the same time be paid to the general condition of the system, and especially to the condition of the intestinal secretions.

ADENOCELE (Gr. *adēnā*, a gland, and *kēlē*, a tumour) is the term now employed in surgery to indicate a kind of new growth in the female breast, the tissue of which closely resembles the breast-tissue itself. It is synonymous with the terms 'Chronic Mammary Tumour,' 'Pancreatic Sarcoma,' 'Mammary Glandular Tumour,' 'Hydatid Disease of the Breast,' 'Serocystic Sarcoma,' &c. The diversity of names indicates the diversity of the outward forms seen in these growths. A full account of these tumours, and of the treatment to be adopted (which consists in excision), is given in Mr Birkett's article, 'On Diseases of the Breast,' in Holmes's *System of Surgery*.

ADERNO (ancient *Adranum*), a town of Sicily, 17 miles north-west from Catania. It is situated at the base of Mount Etna, close to the Simeto, on which are some remarkable cascades near the town. It is surrounded by walls, is a very clean town, and is full of convents and nunneries, mostly founded by the Normans, so that bare walls of lava and grated windows appear everywhere, and the sound of bells is almost incessantly heard. Pop. 13,000.

ADIPIC ACID ($C_{12}H_{20}O_6 \cdot 2HO$) is a dibasic acid of the oxalic series, having the general formula $C_{2n}H_{4n-2}O_6$; and is obtained in the form of white, opaque, hemispherical nodules (which are probably aggregations of small crystals), by the oxidising action of nitric acid on oleic acid, suet, spermaceti, and other fatty bodies. The name is derived from the Latin *adeps*, fat, and must not be confounded with that of a similar acid of the same group, known as *Sebacic Acid*.

ADJYURH, a town of British India, in the presidency of Bengal, and province of Allahabad, 69 miles west-north-west from Rewah. It has a fortress, situated on a very steep hill, and accessible only by well-defended paths. The hill, which is of granite, is isolated, and separated from the north-western edge of a plateau by a very deep and impassable ravine. Within the walls of the fort are two great masses of ruins of temples, resembling in architectural character those of Southern India, and covered with the most elaborate sculptures. A was for a short time the capital of a small Mahratta state, was taken by the British under Lieutenant-colonel Martindell, in 1809, after an obstinate resistance, and restored to its previous possessors, who were Rajpūts. The native line of rajahs became extinct in 1855. Except the summit of the hill,

occupied by the fort, which is healthy, A. is very subject to malaria. The fort is 860 feet above the town, which is 480 feet above the sea. Pop. about 5000.

ADOWA, a town of Abyssinia, the capital of Tigré, 145 miles north-east from Gondar. It is situated partly on the slope and partly at the base of a hill, on the left bank of the Hasam, a feeder of the Atbara, which is a large branch of the Nile. The houses are of the conical form common in Abyssinia, regularly disposed in streets, and mingled with gardens and trees. A. is the chief entrepôt of trade between the interior of Tigré and the coast. It has an extensive transit trade, in which gold, ivory, and slaves are articles of importance. It has also manufactures of cotton fabrics, and iron and brass wares. Pop. estimated at about 8000.

ADRA (ancient *Abdera*), a seaport town of Spain, in the province of Granada, and 49 miles south-east from Granada. It is situated on the shore of the Mediterranean, at the mouth of the Adra. The ancient Abdera, founded by the Phœnicians, was on a hill, at the base of which the modern town stands, in a situation unhealthy on account of swamps. The port is not good, being much exposed to the west. The houses are generally of one story. There is one tolerably wide street, the rest are narrow and ill paved. From the watch-tower of A., in former times, a tocsin sounded the alarm on the approach of African pirates. Lead mines in the neighbourhood give employment to many of the inhabitants, and trade to the port. Among the other exports are grapes, wheat, and sugar. Fishing and the distillation of brandy are carried on. Pop. 7400.

ADU'LLAMITES. An attempt, in the year 1866, by the government of Earl Russell and Mr Gladstone, to carry a measure which would have brought about a sweeping reduction of the elective franchise, gave occasion to a large number of the more moderate Liberals to secede from the Whig leaders, and vote with the Conservatives. The designation of *Adullamites* was fastened on the new party, in consequence of Mr Bright having, in the course of debate, likened them to the political outlaws who took refuge with David in the cave of Adullam (1 Samuel, xxii. 1, 2); a comparison taken up by Lord Elcho, who humorously replied, that the band congregated in the cave was hourly increasing, and would succeed in delivering the house from the tyranny of Saul (Mr Gladstone) and his armour-bearer (Mr Bright).

AFFRIQUE, SAINT, a town of the dep. of Aveyron, France, on the Sorgue, a tributary of the Tarn, 31 miles south-south-east from Rhodéz. It is situated in a beautiful valley, between two mountains, and is surrounded by meadows, orchards, and vineyards. The streets are broad, but the houses are mostly old and mean. It has woollen and cotton manufactories and tanneries. There is a considerable trade in wool; and a principal article of trade is the celebrated *Roquefort Cheese*, made from ewe-milk, chiefly in the mountain pastures around the neighbouring village of Roquefort. About 10,000 cheeses are made annually. They are kept in cellars by the cheesemongers to ripen. This kind of cheese was sent to ancient Rome, and is highly praised by Pliny. Pop. (1866) 5075.

AFIUM-KARA-HISSAR (*Opium Black Castle*), a city of Asia Minor, in the pashalic of Anatolia, 170 miles east-by-north from Smyrna. It stands near the Akar, partly on level ground, and partly on a rising ground among rocks. Above the city, towers an isolated rock of 300—400 feet in height, almost

precipitous on most sides, and very steep on that by which alone it is accessible. The summit has in former times been fortified. The streets of the city are very narrow. Most of the houses are of stone, and well built. A great trade is carried on, the city being an entrepôt between Smyrna and Europe on the one hand, and Armenia, the countries on the Euphrates, and Persia on the other. The products both of Europe and the East are to be found in its markets. A principal article of trade is opium, produced in the neighbourhood, and from it the city derives its name. There are here and in the neighbourhood manufactures of felts, carpets, arms, and saddlery. The saddlery of A. was formerly in request throughout the whole Turkish Empire, but the demand for it has greatly fallen off. The pop. is supposed to be about 60,000.

AGALA'CTIA (Gr. *α*, not, and *γαλακτέ*, milk), a want of the due secretion of milk. It may depend either on organic imperfection of the mammary gland, or upon constitutional causes. In the latter case, the secretion may often be excited by warmth and moisture, by the stimulus of the act of sucking, and if this fail, by the application of the leaves of the castor-oil plant to the breast.

AGATA DE GOTI, SANTA, a town of South Italy, in the province of Benevento, 14 miles east from Capua. It is situated on a hill of volcanic rock, surrounded by the Iaclero, an affluent of the Volturno. It is an episcopal seat, and has a cathedral, seven other churches, and an abbey. Pop. 7951.

AGHMA'T, or **AGHMET**, a fortified town of Morocco, the capital of a province, on the left bank of the Enfis, a tributary of the Tensift, on the north-western slope of Mount Atlas, 24 miles south from Morocco. Pop. 6000, of whom about 1000 are Jews. A. is said to have been at one time the residence of the Moorish emperor.

AGNO'NÉ, a town of South Italy, in the province of Molise, and 22 miles north-west from the town of Campobasso. It stands on a hill, and is said to occupy the site of the ancient *Aquilonia*. It is celebrated for its copper-works. Pop. in 1861, 10,230.

AGO'STA, or **AUGUSTA**, a fortified city of Sicily, in the province of Catania, 12 miles north from Syracuse. It stands on a peninsula projecting into the Mediterranean. It is said to occupy the site of the *Megara Hyblæa* of the ancients, but contains no ancient remains. The present city was founded by the Emperor Frederick II. in 1229. It was the last place in Sicily to hold out against Charles of Anjou, but was betrayed into the hands of William L'Estendard, one of his barons, in 1268, when it was sacked, and its inhabitants mercilessly butchered. It remained desolate for years, but having been re-peopled, and begun again to prosper, it was burned and razed to the ground in 1360 in another Sicilian war; and again was taken and burned by the Turks in 1551. Finally, in 1663, it was destroyed by an earthquake, when one-third of the inhabitants perished. It has three long parallel streets. The houses are generally of one story. The port is spacious, but of rather difficult access. Salt is the chief article of export. Oil, wine, cheese, fruit, honey, and sardines are also exported. Pop. 9735.

AGUILAR DE LA FRONTERA, a town of Andalusia, Spain, in the province of Cordova, occupying the summits and slopes of several low hills on the left bank of the Cabra, 26 miles south-south-east from Cordova. Many of the houses are of three stories, and the town is remarkable for the whiteness of its houses and the cleanness of its streets. It

has three fine squares, and a dismantled Moorish castle. The chief trade is in corn and wine. Many of the inhabitants are employed in agriculture, and in the breeding of oxen, horses, and mules. Pop. 11,836.

AGUR, a town of India, in the territory of Gwalior, the possessions of Scindia's family, on the route from Oojein to Kota, 41 miles north-east from Kota. It stands in an open plain, 1598 feet above the sea, is surrounded by a rampart of stone, and has on one side of it a large and fine tank. Pop. about 30,000.

AHMEDNU'GGUR, a Rajpoot district of Guzerat, in the division called Myhee Caunta, politically connected with the presidency of Bombay. It is under the rule of the Rajah of Edur, subject to British sovereignty. The amount of tribute from A. is £895 a year.—The principal town is Ahmednuggur, on the banks of the Haut Mati, a branch of the Sabarmati, in an extensive plain, 92 miles north-north-west from Baroda. It is surrounded by a fine old stone wall. Pop. 9000.

AHMEDPU'R, a town of India, in the native state of Bhawalpur, and 25 miles south-west from Bhawalpur. The houses are mostly built of mud; but there is a large and lofty mosque, with four tall minarets. There are manufactures of matchlocks, gunpowder, cotton, and silk. The pop. has been estimated at 30,000, but other estimates make it much less.

AIDAN, SAINT, one of those distinguished monks of the early Scoto-Irish Church, who were received into the calendar of saints by a sort of acclamation, and without the ceremony of canonisation. His period is the middle of the 7th century. He was the first efficient missionary who propagated Christianity in the north of England. Oswald, the celebrated king of Northumbria, requested the community of Iona to send to his court one of their brethren who would teach the Christian religion to his people. As the history has come down to us, the first person sent was a certain Cormac, who was too dogmatic and intolerant to be a successful missionary. On his returning after a failure, A., who possessed the patience, geniality, and popular manners fitted for the task, was successful. He left a great reputation, and, as the earliest promulgator of Christianity in the northern districts, is generally counted the first in the lists of the bishops of Durham.

AIDO'NÉ, a town of Sicily, in the province of Caltanissetta, 20 miles east-by-south from Caltanissetta. It crowns the summit of a lofty height, commanding a view of the great plain of Catania. It was one of the settlements of the Lombards, who accompanied Roger the Norman in his conquest of Sicily. The road which leads to the town is very rugged, bordered by luxuriant prickly pears. Pop. 5920.

AIN-TA'B, a town of Syria, near the source of the Kowek, an affluent of the Euphrates, 59 miles north-north-east from Aleppo. It is tolerably well built: the houses are mostly of stone. It is well supplied with water, pure streams of which flow constantly through the streets. It has a castle built upon a mound, resting on rock, and of very striking appearance. The chief trade is in hides and leather; but cotton, sheep's and goat's wool, wax, wheat, and rice are also of commercial importance, being chief articles of produce in the surrounding district. A. is supposed by some to be the ancient *Antiochia ad Taurum*. Pop. 20,000, composed of Turks, Greeks, and Armenians.

AIRE, or AIRE-SUR-L'ADOUR (anc. *Vicus Julius*), a town of the dep. of Landes, France, on

the left bank of the Adour, 76 miles south from Bordeaux. It is a bishop's seat; and its cathedral, which has been often destroyed and rebuilt, is one of the most ancient in France. A. has been a place of consequence from the days of the Roman conquest of Gaul, and was the capital of the Visigoths under Alaric, but is now much decayed, and diminishing in population. It has hat manufactories and tanneries. Pop. 2600 in 1866.

AIRE, or AIRE-SUR-LE-LYS, a town of the dep. of Pas-de-Calais, France, on the Lys, 30 miles south-east from Calais. It is a fortress of the third class; the town well built, but its situation low and marshy. The barracks are capable of containing 6000 men. There are manufactures of woollen stuffs, linen yarn, thread, hats, starch, Dutch tiles, and soap; also some trade in grain. Osier-work is carried on to some extent. Pop. (1866) 4727.

AJURUO'CA, a town of the province of Minas Geraes, Brazil, 100 miles north-west from Rio de Janeiro. It is situated in a fertile country, at the northern base of the Sierra Mantiqueira, on the river Ajuruoca, one of the head-waters of the Parana. The surrounding district once yielded much gold, which has apparently been exhausted; but it produces excellent crops of tobacco, millet, mandioc, sugar, and coffee. Swine are reared for the market of Rio de Janeiro. Pop. (including district) about 12,000.

AKBARPU'R, a town of India, in the British district of Cawnpore, 28 miles west from Cawnpore, on the route from Cawnpore to Etawa. It is the capital of a pergunnah of the same name. Pop. 6330.

AKHALZIKH, or AKI'SKA, a town of Russian Armenia, 90 miles west from Tiflis, on the left bank of the Dalka, an affluent of the Kur. It is situated in a valley of the Keldir Mountains, and at such an elevation above the sea, that the winter is severe, although the summer is very hot. A. was anciently called Keldir or Chaldir. It is without walls, but has a strong citadel, built on a rock. The mosque of Sultan Ahmed, built on the model of St Sophia, in Constantinople, has a library attached to it, which was accounted one of the most valuable in the East; but the Russians, after acquiring possession of A., carried off great part of its most valuable treasures to St Petersburg. Maize, wheat, barley, flax, cotton, silk, grapes, figs, and honey are produced in the surrounding district. Some manufactures are carried on in the town, and it maintains an active trade with various places on the Black Sea. Pop. 15,000, two-thirds of whom are Armenians.

AK-HISSA'R (anc. *Thyatira*), a town of Asia Minor, in Anatolia, 52 miles north-east from Smyrna, on somewhat elevated ground in the valley of the Hyllus. The streets are paved with carved stone, and other relics of antiquity abound; but there are no ruins of ancient buildings. Cotton goods are exported. Pop. estimated at 6000, of whom about 5000 are Turks, and the remainder mostly Greeks.

AKHLA'T, or ARDI'SH, a town of Asiatic Turkey, in the pashalic of Van, and 58 miles north-west from Van. It is situated on the north-west shore of Lake Van, and is surrounded by a double wall and moat, and further protected by towers and a citadel. Pop. estimated at 6000. The old city of A., at a little distance from the present town, in a ravine, was the residence of the kings of Armenia, and was the scene of many conflicts between the Greeks, Armenians, and Persians. It was taken

and devastated in 1228 by Jelal-ud-deen, and completely destroyed by an earthquake in 1246.

AKHYRKA, a town of European Russia, in the government of Kharkov, and 58 miles north-west from Kharkov. It is situated on a small river of the same name, an affluent of the Dnieper. It was founded by the Poles in 1641. It has manufactures of light textile fabrics, and a great annual fair. The neighbourhood is very fertile. Pop. 13,946.

A'KRON, a town of the state of Ohio, North America, the capital of Summit County. It is situated 36 miles south of Cleveland, on the Little Cuyahoga, which falls into Lake Erie, and at the junction of the Ohio and Erie Canal with the Pennsylvania and Ohio Canal, at the highest point in the course of the former canal, whence its name (Gr. a summit). It is also on the Cleveland and Zanesville Railway. It was first settled in 1825. It has woollen factories, flour-mills, a steam-engine factory, a stove-factory, &c. The machinery of all its public works is driven by water-power. It is a place of considerable trade. Pop. 6000.

AK-SHE'HB (*White City*, anc. *Philomelion*), a city of Asiatic Turkey, in the pashalic of Karaman, five miles south of the salt lake of Ak-shehr, at the entrance of an extensive mountain valley. The houses rise in successive terraces on the slope of a hill. There is here a celebrated carpet manufactory. Pop. estimated at 6000.

AK-SU', a town of Chinese Turkestan, 260 miles north-east from Yarkand, on an affluent of the Tarim, and on the southern base of the Thian-shan Mountains. It is the military head-quarters of this part of the Chinese Empire, and a large garrison is maintained in it. It was formerly the residence of the kings of Kashgar and Yarkand. In 1716, it was nearly destroyed by an earthquake, and in the beginning of the present century, suffered terribly from an inundation, in which 3000 persons perished. It is celebrated for its manufactures of cotton cloth and elaborately ornamented saddlery. It is much resorted to by caravans, as an entrepôt of commerce between Russia, Tartary, and China. The pop. is very variously estimated from 6000 to 20,000 and upwards. Sheep and cattle are extensively reared in the neighbourhood.

AKYAB, a town of Further India, the chief seaport of the district of Akyab or Aracan Proper, and the capital of the province of Aracan. It was formerly called *Twet-twe*, and sometimes still receives that name. It is situated on the eastern side of the island of Akyab, at the mouth of the Kuladyné or Coladyné. The houses are well built, the streets broad and regular. The town is rapidly rising in commercial importance. Light-houses have been erected for the benefit of the harbour. Pop. about 5000 in 1861.

ALABAMA, THE, an armed vessel of the Confederate States of America, which inflicted terrible injury upon the shipping of the Northern States of the American Union during the civil war which broke out in 1861. The career of the *A.* was in more than one respect unparalleled in the history of any previous naval war. She was, for a war-ship, a small vessel, built for speed, carrying a few guns, and intended not for fighting, but for preying upon defenceless merchant-ships. She was almost the only vessel the Confederate States had upon the open seas; but the destruction she wrought was so great, and in effect so alarming, as to produce a very marked diminution in the number of commercial vessels carrying the flag of the United States. She was built, too, in a British port, and never, at any time, entered a port of the state by which she was

commissioned: there was no port available for the disposal of her prizes, and, ship and cargo, they were usually burned. Her career demonstrated how completely, in the present state of commerce, under the conditions of navigation and naval warfare produced by steam and long-range artillery, belligerents fairly matched might ruin each other at sea; and it raised international questions between the United States and Great Britain, which are likely to be solved by a new definition of the duties of neutrals in time of war. Even the end of the *A.* was singular and instructive: perhaps it was too honourable an end for such a career as hers. She went down in an artillery duel, quixotically entered upon for a fancied point of honour, with a vessel protected by armour: illustrating the impotence, in modern naval warfare, of the gallantry of the most gallant of seamen against advantages derived from speed, armament, and armour.

At the beginning of the civil war in 1861, the Confederate States were without a navy, and apparently without the means of acquiring one. Their population was agricultural; they had neither ships nor seamen; and the Northern States promptly instituted an effective blockade of nearly all their ports. The able men who had planned the secession of the Southern States from the American Union had not overlooked the subject of a navy; but events had been against them. They had reckoned upon securing a part of the United States fleet; and before the war commenced, they had determined upon fitting out small and swift vessels, carrying a few heavy guns, to cruise against the Northern commerce. They had no lack of able naval officers; for a majority of the senior naval officers of the United States were Southern men, and were at their command. Early in 1861, while parleying was still going on between the North and the South, and hopes of a peaceable separation were not extinct, Captain Raphael Semmes had been empowered by the Southern leaders to purchase ships and stores for the South; but as regards ships, Captain Semmes appears to have been unsuccessful. It was not till several months after the war began, in June 1861, that the Confederate States were able to send their first armed cruiser to sea. This was the *Sumter*, a small steamer, which had previously traded between New Orleans and Havana. Captain Semmes, who was appointed her commander, was singularly qualified for the work expected of him. He was a native of Maryland, about 51 years of age; he had been a Commander in the United States navy, and now held the same rank in the service of the Southern States. Besides possessing high professional abilities and attainments, he was a man of acute intellect and of decided character; and he was thoroughly instructed in the principles and details of international law and etiquette. He seems to have united with the good qualities of a naval officer the qualifications of an able lawyer, diplomatist, and publicist. He could be trusted to secure for a war-vessel of the Confederacy, however small, every advantage to which she was entitled from neutral powers; to give to subjects of neutral powers, and of the other belligerent alike, nothing which was not strictly their due; to carry out without flinching, unmoved by taunts and abuse, the work of destruction which was expected at his hands. His career in the *Sumter* is a record of triumphs won over neutral governors and ministers, who were disinclined to admit the little *Sumter* to the position of a belligerent war-vessel; of clever avoidance of the enemy's cruisers, of which several were always on his track; and of the destruction of valuable ships and cargoes belonging to citizens of the United States. The *Sumter* and her captain

were soon known throughout the world. The enemy called Captain Semmes a pirate, and could they have caught him, would probably have treated him as a pirate. But he appears to have done nothing but what it was his right as a belligerent to do; at anyrate, he was scrupulous not to exceed the precedents of international law. It was upon his system of burning his captures, not upon the captures themselves, that the people of the Northern States founded their charge of piracy; but no Confederate port was open to him for the disposal of his prizes; and his treatment of them, though it greatly shocked an age which had seen scarcely anything of naval warfare, was warranted by precedents, and was probably, though not unquestionably, within his right. As an occasional resource, to be adopted upon an emergency, the burning of captures made at sea is undoubtedly lawful; it is not so certain that a belligerent is at liberty to carry out a system of burning captures, made without the hope of being able to bring them into port for adjudication before a prize court. The cruise of the *Sumter*, which began on the 30th June 1861, with her escape from New Orleans, then strictly blockaded, was over before the end of the year; but she had captured 18 vessels, had spread alarm through the Northern seaports, and had put shipowners and merchants to heavy charges for insurance; and by disinclining merchants to ship their goods in Northern vessels, had seriously injured the shipping-trade of the Northern States. Eventually, she was laid up at Gibraltar, and declared unfit for further service: had she been seaworthy, it would have been very difficult to carry her out of a port where she was diligently watched by Northern cruisers. She had, however, verified the anticipations of the Confederate government; and in 1862, this government found a successor for her, much better fitted for the work to be done, and destined to far greater celebrity. This was the *Alabama*.

This vessel was built for the Confederate government by Messrs Laird and Sons at Birkenhead. She was a screw steam-sloop of 1040 tons register, built of wood, and for speed rather than strength. She was barque-rigged, and was fitted with two engines of 350 horse-power each; she was pierced for 12 guns, and had the means of carrying two heavy pivot-guns amid-ships. She cost £47,500 without her equipment; including her equipment, £51,716. Semmes, now a captain in the Confederate service, was, in June 1862, appointed to superintend her equipment, and take command of her when ready for sea. Both Captain Semmes and Commander Bullock, who had superintended the building, were enjoined by the Confederate government to keep the destination of the vessel as secret as possible, and carefully to avoid any infringement of public law, or of the municipal law of Great Britain, which would give the British government a pretext for seizing her. These instructions were carefully acted upon. The destination of the 'No. 290,' as she was called from her number in the list of steamships constructed by the Messrs Laird, was so well concealed, that she was nearly finished before it was suspected by the emissaries of the United States. According to previous practice, there was no great difficulty in avoiding the infringement of the public and of the municipal law in such a case. It had been held lawful to build vessels for a belligerent in neutral ports, and lawful to purchase guns and stores in neutral ports, though they might be for the equipment of vessels thus built. What had been held unlawful was the equipment with guns and warlike stores of a vessel built for a belligerent in a neutral port previous to her leaving the neutral jurisdiction. Captain Semmes did not

intend to equip his vessel at Birkenhead, and therefore, supposing the rules of public law to have remained unchanged, he intended no infringement of the law. But the United States minister called upon the British government to detain the 'No. 290,' submitting some evidence that she was intended for a Confederate war-vessel. He maintained, or, at anyrate, it has since been maintained on the part of the United States, that her construction, being that of a war-vessel, was so different from that of vessels built for trade, as itself in some measure to constitute an equipment for war. The British government consulted the crown lawyers, who at first thought the evidence of destination insufficient. Afterwards, when further evidence was presented, a delay was caused by the illness of Sir John Harding, the Queen's Advocate. When an opinion favourable to the detention of the vessel was at length given, 'No. 290' was gone. The builders, made aware of the danger of a seizure, had made haste with their work; the vessel, though unfinished, was got ready for sea; under pretence of a trial trip, she made her way down the Mersey to Moelfra Bay, where the work remaining to be done was actively carried on; and on the morning of the 31st July 1862, warning having been given that she was to be seized that day, the 'No. 290' steamed away from the British coast. The ablest English lawyers were of opinion that there had been no infringement of the law, but that a case had been presented which the British government was bound to submit to a court of law. The detention of the vessel during a protracted lawsuit would have served the purposes of the United States almost as well as her condemnation; and as she must have been detained but for the delay caused by Sir J. Harding's illness, it is not without a show at least of reason that the United States government now claims from Great Britain indemnification for the losses consequent upon her escape.

'No. 290' made for Terceira, one of the Western Islands, where she arrived on the 13th of August—her speed and sea-going qualities being fully proved upon the voyage; and a few days after she was joined by the *Agrippina* of London, carrying her guns, stores, and supply of coal, and by the *Bahama*, with Captain Semmes and his officers on board. By the 24th of August, she had shipped her armament and stores, and was ready for sea; and now Captain Semmes produced his commission to the sailors, named the vessel the *A.*, and hoisted the Confederate flag. The sailors on board the *A.* and her consorts were Englishmen, all entered for a feigned voyage; but with few exceptions, they enlisted under Captain Semmes, though the terms upon which they insisted were exorbitant. The crew now consisted of 80 men all told; and the armament of eight 32-pounders. By the end of August, the vessel was got into good order; and she made her first capture on the 6th of September. Within eleven days of that date, she captured and burned property the value of which exceeded her own cost. The people of the United States were filled with indignation against Great Britain for permitting the escape of such a destroyer. Their indignation against 'the pirate Semmes' was only less than the alarm with which they regarded the depredations of the *A.* Several fast-sailing cruisers were sent in search of her.

Captain Semmes made for the American coast, which he had determined to make his first cruising-ground. He was ambitious of making a few captures within sight of New York; but running short of coal, he was obliged to give up this somewhat daring scheme, and make for a coaling-station. He afterwards lay on the track of the California

mail-steamers running between Aspinwall and New York; and after waiting for some time, he captured the *Ariel* mail-steamer, with 140 marines, several United States officers, and 500 other passengers on board. A heavy gun and a quantity of specie were all that he took by this capture, but it greatly raised the prestige of the A., and increased the alarm of American shipowners. The passengers and crew of the *Ariel* were too numerous to be taken on board the A.; and as Captain Semmes found yellow fever raging at Kingston in Jamaica, at which port he intended to have landed them, he was unable to destroy the vessel, and had to set her free, after taking a bond for a large sum to be paid on the conclusion of the war. Shortly after, on the 11th January 1863, an encounter occurred between the A. and a United States vessel, which still further augmented the reputation of the former. Cruising off Galveston in Texas, the A. gave battle to the United States gun-boat *Hatteras*, an old vessel, somewhat her inferior in armament, and sunk her after a few broadsides. The destruction of the *Hatteras* and the capture of the *Ariel* were the most remarkable events in the career of the A. until her closing scene arrived. Her history consists of a monotonous succession of captures made in different seas, her prizes being merchant-vessels incapable of resistance, which were burned, or, when there was convincing evidence of the neutral ownership of the cargo, which did not often happen, liberated upon bond. She captured in all 65 vessels; and the value of the property she destroyed has been estimated at 4,000,000 dollars. It was, however, by the heavy insurance for war-risks to which she subjected them, and still more by the difficulty she caused them in getting freights, that the A.'s career inflicted the greatest injury upon the shipowners of the United States. When the pursuit after her became too hot on the American coast, she sailed for the Cape of Good Hope, and cruised in the eastern seas. Returning to Europe, she arrived in the English Channel in June 1864, and on the 11th of June entered the French port of Cherbourg to refit and supply herself with stores. She had been nearly two years at sea, and had got into bad condition; her speed and sailing qualities were considerably impaired. Permission to make the necessary repairs was given by the authorities of the port of Cherbourg.

But within a few days, the United States steamer, *Kearsage*, commanded by Captain Winslow, a former shipmate of Captain Semmes, arrived at Cherbourg; and she made a demonstration which the officers and crew of the A.—writhing under the abuse that had been heaped upon them, and aware that their career had been inglorious—regarded and resented as a challenge. Captain Semmes knew, and probably shared their feelings, and determined to gratify them; he sent notice to the United States consul that he would sail out and fight the *Kearsage*. The two ships were, to appearance, not unequally matched, in reality the *Kearsage* had considerably the advantage in number of crew, armament, speed, and general condition; besides that, she was protected amid-ships by armour. The fact of her being thus protected, and the extent of her superiority, seem to have been unknown to Captain Semmes. The fight took place on Sunday, the 19th of June, outside the port of Cherbourg, all Cherbourg gazing at it from the neighbouring heights. The *Kearsage*, having the superiority in sailing, was able to keep at a distance of about 500 yards from her enemy; her armour in a great measure protected her from the enemy's shot; and, as might be expected, her guns were better served than those of the Alabama. Before the fight had lasted an hour, Captain Semmes found his ship was sinking, and gave orders to pull

down his flag. The boats were got out, and the wounded placed in them; but before the *Kearsage* could come to the rescue, the A. went to the bottom. The boats of the *Kearsage* saved many of the crew. Others, including Captain Semmes, were picked up by an English yacht, belonging to a Mr Lancaster, the *Deerhound*, which had been near during the fight, and had been allowed by Captain Winslow to help in rescuing the A.'s crew. These the *Deerhound* immediately carried within the neutral jurisdiction. The American captain was very angry at being deprived of his most important prisoner by the *Deerhound*; and Semmes and the others saved by this vessel were afterwards charged with having broken their faith as prisoners who had asked for quarter from the *Kearsage*. But as regards the *Deerhound* at least, there was no room for any charge; the seamen of the A., once upon its deck, were entitled to the protection of Great Britain, and no previous compact could have deprived them of it. The charge against Captain Semmes and his companions, too, appears unreasonable; and it need cause no reflection upon the courage of the commander of the A. that he embraced the chance of escaping from a captor whose government would have tried, and perhaps punished him as a pirate.

It is to be hoped that as a result of the negotiations now pending between Great Britain and the United States, any such international complication as that arising out of the case of the A. will be rendered easily avoidable. A full account of the Alabama's career will be found in a work published at London in 1864—*The Cruise of the Alabama and the Sumter*, compiled from the papers of Captain Raphael Semmes.

ALAIS, a town of the dep. of Gard, France, situated in a fertile plain, on the right bank of the Gardon, at the base of the Cevennes Mountains, 23 miles north-west from Nîmes, with which it is connected by railway. It embraced the Protestant cause in the religious wars of France; and Louis XIII. in person, accompanied by the Cardinal de Richelieu, besieged it, and having taken it in 1629, demolished its walls. Three years later, the Baron of Alais having taken part in the rebellion of Montmorency, the castle was destroyed. Protestantism still prevails to a considerable extent. A. is a very flourishing town, and owes its prosperity chiefly to the mineral wealth of the surrounding district, which produces coal, iron, lead, zinc, and manganese. The coal and iron mines are of chief importance. There are large iron-foundries in the town and neighbourhood. There are also manufactures of ribbons, stockings, gloves, vitriol, and earthenware. A. is an episcopal seat. Pop. (1866) 12,392.

ALAJUE'LA, a city of the state of Costa Rica, Central America, 23 miles west-north-west from Cartago, and a little on the western side of the water-shed between the Atlantic and the Pacific. It contains many good houses, and has extensive suburbs of detached houses, embowered among trees and flowering shrubs. The neighbourhood is chiefly devoted to the culture of the sugar-cane. Pop., including suburbs, 12,575.

ALAMOS, Los (i. e., *The Poplars*), a town of Mexico, in the state of Sonora, and department of Sinaloa, 110 miles north-north-west from Sinaloa. It is situated in a barren plain, but in a region famous for its silver mines. The houses are mostly of stone or brick, covered with stucco. Provisions are dear, being brought from a distance, and the town is very insufficiently supplied with water. Pop. 10,000.

ALA-SHEHR (i. e., *The Exalted City*, ancient

Philadelphia), a city of Asia Minor, in the pashalic of Anatolia, 75 miles east-by-south from Smyrna, at the north-east base of Mount Tmolus. It was founded by Attalus Philadelphus, king of Pergamos, about 200 B.C., and is famous as the seat of one of the 'Seven Churches of Asia.' It is still a place of considerable importance, and carries on a thriving trade by caravans, chiefly with Smyrna. It is surrounded by a wall, and is of large extent; but the streets are narrow and dirty, and the houses generally mean. There are many interesting remains of antiquity. Pop. supposed to be about 15,000.

ALAU'SI, a town of the republic of Ecuador, South America, in the province of Chimborazo, 70 miles east from Guayaquil, at an elevation of 7980 feet above the sea, in a valley of the Andes, on the river Alausi, which flows into the Gulf of Guayaquil. The valley of the Alausi is extremely fertile, producing sugar, grain, and fruits. There are manufactures of woollen and cotton cloth in the town. Pop. 6000.

A'LBA (ancient *Alba Pompeia*), a very ancient city of North Italy, in the province of Cuneo, on the right bank of the Tanaro, 31 miles south-east from Turin. It is situated in a plain surrounded by hills. The neighbourhood produces much wine and silk, besides corn, oil, and fruits. The town has an extensive trade in cattle. It is an episcopal seat; the cathedral was founded in 1486. Pop. 9677.

ALBACETE, a town of Spain, capital of the province of the same name, in Murcia, 138 miles south-east from Madrid, and a station on the railway from Madrid to Alicante. It stands in a fertile but treeless plain, is built with some degree of regularity, and contains a number of squares and many good houses. It is a place of considerable trade, and has great cattle-fairs in September. It is noted in Spain for the manufacture of knives and other steel goods, which, however, are very inferior to those of Sheffield. Pop. 11,000.—The province of Albacete is partly formed from the former kingdom of Murcia, and partly from New Castile. It is generally hilly, and in some parts mountainous, some of its mountains attaining an altitude of 5000 feet; but it contains also rich plains and fertile valleys. Agriculture is in a more advanced state than in most parts of Spain; corn and wine are largely produced, as also oil, hemp, tobacco, saffron, fruits of various kinds, and honey. Great numbers of sheep, goats, oxen, horses, mules, and asses are reared. The mineral wealth of the province appears to be considerable, but is not turned to much account. The area of the province is 5966 sq. m.; pop. 201,118.

ALBAY', a town of the island of Luzon, Philippine Islands, the capital of a province of the same name, in the south end of the island. It is situated about two miles from the Bay of Albay, which is an excellent harbour, and very near a volcano also called Albay, which is in a state of constant activity. Earthquakes are frequent, but the province is very fertile. The town is regularly built, contains some good houses, and is a place of considerable trade. Pop. 13,115.

A'LBERT N'YANZA (the Little Luta Nzige of Speke), a large lake of East Central Africa, one of the reservoirs of the Nile, situated in a deep rock-basin, distant, at the nearest point, 80 miles west of the Victoria N'yanza. So far as yet known, the A. N. is of an oblong shape, and extends from lat. 2° 45' N. to 2° S.—upwards of 300 miles. Where crossed by the equator, it is 92 English miles in breadth. On the east, it is fringed by precipitous cliffs, having a mean altitude of 1500 feet, with isolated peaks, rising from 5000 to 10,000 feet. The surface of the lake is 2720 feet above the sea, and

1470 feet below the general level of the country; its water is fresh and sweet, and it is of great depth towards the centre. The north and west shores of the lake are bordered by a massive range of hills, called the Blue Mountains, which have an elevation of about 7000 feet. The existence of this vast lake first became known to Europeans through Speke and Grant, who, in 1862, heard of the Luta Nzige as a narrow reservoir forming a shallow back-water of the Nile. See map to article NILE. When Speke and Grant, after the discovery of the Victoria N'yanza, were, in 1863, descending the Nile on their return to Europe, they met, at Gondokoro, Mr (now Sir) Samuel White Baker (q. v.), who was ascending the river in the hope of meeting with and aiding these travellers. As soon as they informed him of the reputed great lake, Baker agreed to undertake its exploration. Joining a trading party, he travelled south-eastwards to Latooka, which he describes as the finest country he had seen in Africa. His course was now south and south-west, through the countries of Obbo and Madi, crossing the Asua, a tributary of the Nile, on 9th January 1864. Journeying next in a south and south-eastward direction over uninhabited prairies and swampy hollows, he came upon the Nile at the Karuma Falls, lat. 2° 17' N., at the identical spot where it had been crossed by Speke and Grant. Being prevented, by the jealousy of King Kamrasi, from following the course of the stream to the westward, he was forced to proceed, by slow marches southward on the west side of the Somerset or Nile, to M'rooli, leaving which, his course lay south-west on the south side of the Kafoor River. After a toilsome march of eighteen days from M'rooli, the party came in sight of the glorious expanse of water. Baker says: 'Weak and exhausted with more than twelve months' anxiety, toil, and sickness, I tottered down the steep and zigzag path, and in about two hours reached the shore. The waves were rolling upon a bank of sand; and as I drank the water, and bathed my face in the welcome flood with a feeling of true gratitude for success, I named this great basin the Albert N'yanza, in memory of a great man who had passed away.'

The spot where the party first reached the lake, Vacovia, is in lat. 1° 14' N., 30° 40' E. Embarking thence in canoes, the party coasted north-eastward, and in 13 days arrived at Magungo, lat. 2° 16' N., near the mouth of the Somerset River. At this part, the lake was under 20 miles in width, and appeared to stretch away in a north-west direction. From Magungo, 250 feet above the lake, the travellers had a view of the Nile Valley for 15 or 20 miles northwards. Ascending the Somerset, at a distance of 25 miles from its mouth, the canoe-voyage was interrupted by a grand cataract 120 feet high, which was named the Murchison Falls. The explorers proceeded south-eastwards for about 30 miles to Kisoona, and then a march north-east for about the same distance brought them to the Karuma Falls, where they first entered the lake-region. The name Somerset is adopted from Speke's first map, in order to distinguish that river from the Nile proper. It issues from the Victoria N'yanza at the Ripon Falls, and flowing north-west and west for about 230 miles, it enters the A. N. within 30 miles of its northern extremity, and soon quits it to form the true Nile. From the Ripon Falls for 30 miles north, and from the Karuma to the Murchison Falls, 45 miles, the Somerset forms a series of rapids. The A. N. receives the drainage of a great equatorial mountain range, where rain falls during ten months of the year. The scenery of the lake is described as extremely beautiful. Salt, which is very abundant in the soil on the

eastern shores of the lake, is now the only article of trade to the inhabitants. Formerly, Magungo was a large town, when the trade from Karague, in lat. 2° S., was conducted in large boats sent by Rumanika, the king of the country, with cowrie shells and brass bracelets from Zanguebar, to be exchanged for ivory.

ALBOSTA'N, a town of Asiatic Turkey, in the pashalic of Marash, and 39 miles north-east-by-north from Marash. Pop. estimated at 9000.

ALBO'X, a town of Andalusia, Spain, in the province of Almeria, 42 miles north-east from Almeria, on a small affluent of the Almanzora, which divides the town into two parts. It has some good streets and buildings, and a fine square. Blankets, coarse linen and hempen fabrics, and earthenware are manufactured. There are also corn and oil mills. There is a great annual fair in November, lasting for a fortnight. Pop. 7430.

ALBU'GO is a term employed in Surgery to designate the white opacity that often follows ulceration of the cornea of the eye. In infancy, the comparatively rapid interchange of materials will often diminish to a great extent both the extent and density of these spots; but in after-life, they do not undergo similar absorption, nor are they amenable to surgical relief.

ALBUÑOL, a town of Spain, in the province of Granada, 41 miles south-east from Granada, and about 3 miles from the coast of the Mediterranean. It is a well-built town, with clean paved streets. The surrounding district abounds in vineyards, and is also very productive of figs and almonds. The making of wine and brandy, and the drying of raisins, are the chief occupations of the inhabitants of the town itself. Pop. 6764. The port of A. is a small place called La Rabitá.

ALBUQUERQUE, a town of Estremadura, Spain, in the province of Badajoz, and 24 miles north from Badajoz. It is a decaying place. Cotton and woollen fabrics are manufactured, also earthenware, soap, and chocolate. The neighbourhood is fruitful, producing corn, wine, oil, flax, honey, and fruits. Pop. 5470.

ALBUQUERQUE, a town of Bernalillo County, New Mexico, U. S., on the left bank of the Rio Bravo del Norte, 41 miles south-south-west from Santa Fé. Pop. 6000.

ALCALA' DE GUADAI'RA (*The Castle of the Guadaira*), the ancient Carthaginian *Hienippa* ('place of many springs'), a town of Andalusia, Spain, in the province of Seville, and 7 miles east-by-south from Seville. It stands near the Guadaira, partly on a hill, so that some of the streets are very steep, and is overlooked by the ruins of an ancient Moorish castle, once one of the most important, as its ruins are still among the finest, in Spain. This town is beautifully situated, and on account of the salubrity of its climate, is much resorted to as a summer residence by the inhabitants of Seville. It is celebrated for producing the finest bread in Spain; there are more than fifty bakeries in the town, and Seville is chiefly supplied from it. The water-mills and mule-mills for making flour are more than 200 in number, and with the bakeries, give employment to great part of the population. Every process connected with the making of bread is conducted with the greatest care. Seville is also supplied with water from the hill above A., which is perforated by tunnels, some of them 6 miles in length, forming underground canals. Some of the tunnels are believed to be Roman works, but most of them are known to have been made by the Moors. The water flowing through the subterranean canals is

as clear as crystal. The neighbourhood of A. is fertile, producing corn, wine, oil, silk, honey, and fruits, also sheep and oxen. Pop. 6702.

ALCALA' LA REAL (*The Royal Castle*), a city of Andalusia, Spain, in the province of Jaen, and 26 miles north-west from Granada. It is situated on a conical hill, in a narrow valley, on the north side of the mountains which separate the province of Jaen from that of Granada, at an elevation of nearly 3000 feet above the sea. It is a very picturesque town, irregularly built, with steep and narrow streets and bold towers. It was the stronghold of the Alcaide Ibn Zaidé; and being taken in 1340, by Alonso XI. in person, it obtained the name *Real*. It has a hospital, formerly an abbey, a very fine building. The neighbourhood produces grain and fruits of the finest quality, and the inhabitants of the town are mostly engaged in agriculture. There is some trade in wine and wool. Pop. 11,521.

ALCAMO, a town of Sicily, in the province of Trapani, and 23 miles east from Trapani, in the Val di Mazzara, on the high-road between Palermo and Trapani. It is said to have been founded by the Arabs, on their first invasion of Sicily in 827. The original town stood on a hill, and long retained a Moslem population, who were driven out by the Emperor Frederick II. in 1233, and the new town was built at the foot of the hill. A. is surrounded by a battlemented wall of the 14th century. The houses are mostly mean, and the streets irregular and dirty; the whole place having an air of poverty and decay. It contains, however, some fine old churches and palaces. Pop. (1861) 19,518.

ALCAÑIZ, a town of Aragon, Spain, in the province of Teruel, 63 miles south-east from Saragossa. It is situated on a rising ground on the right bank of the Guadalupe, which is here crossed by a bridge of nine arches. It is a well-built town, with wide paved streets, and a number of squares. It has a magnificent collegiate church, in which are many fine tombs and pictures. There are manufactures of silk, woollen, and coarse linen fabrics, hats, and soap; there are also flour and oil mills, and some trade in grain, cattle, and the manufactures of the town. Pop. 6400.

ALCA'NTARA, a seaport town of Brazil, in the province of Maranhão, 17 miles north-west from Maranhão, near the mouth of the Bay of St. Marcos. Most of the houses are only of one story. The more wealthy residents are mostly cotton-planters; the poorer classes live chiefly by fishing, and by making hammocks of some of the peculiar fibres of the country. There are salt-pits not far from the town. Cotton, rice, and salt are exported. Pop. 10,000.

ALCARAZ, a town of La Mancha, Spain, in the province of Albacete, and 36 miles west-south-west from Albacete. It stands on the slope of an isolated hill, on the left bank of the Guadarmena, a feeder of the Guadalquivir. A ruined castle crowns the summit of the hill; and there are also the remains of a fine Roman aqueduct. Some of the streets are very steep. The inhabitants are partly employed in weaving and iron-working, partly in agriculture. Pop. 7325.

ALCAUDE'TE (anc. *Uditumum*), a town of Andalusia, Spain, in the province of Jaen, and 22 miles south-west from Jaen. It is situated in a hollow, enclosed by three hills, on an affluent of the Guadalquivir, is overlooked by the ruins of an ancient castle, and is tolerably well built. There are fine pictures in some of the churches. Oil and rope making, weaving, and agriculture are the chief employments of the inhabitants. Grain, silk, oxen, sheep, goats, pigs, mules, and asses are produced in the neighbourhood. Pop. 6242.

ALCA'ZAR DE SAN JUA'N (anc. *Alce*), a town of New Castile, Spain, in the province of Ciudad Real, and 49 miles north-east from Ciudad Real, on the Madrid and Alicante Railway. It is regularly built, and has two good squares. There are manufactures of soap, nitre, and gunpowder. Pop. 7540.

ALCIRA (anc. *Sebaticula*), a town of Spain, in the province of Valencia, 20 miles south-by-west from Valencia, on an island in the river Xucar, the two branches of which are here crossed by stone bridges. It is surrounded by old walls, with strong towers. The principal streets are wide, but the town is ill built. The inhabitants are chiefly employed in the manufacture of earthenware, the production of silk, and agriculture. The surrounding country is much intersected by canals, exhibiting an admirable specimen of the system of irrigation introduced by the Moors. Pop. 9250.

ALCOHOL, PHYSIOLOGICAL AND POISONOUS ACTION OF. Alcohol, in a concentrated form, exerts a local irritant action on the membranes and tissues of the animal body. According to various circumstances, as, for example, its greater or less dilution, the quantity in which it is administered, the emptiness or fulness of the stomach, and the nature of the animal on which the experiment is made, alcohol may either act as a gentle stimulus, which assists the digestive process, or it may excite such a degree of irritation as may lead to the disorganisation of the mucous membrane. It is well known that dilute alcohol, in contact with animal matter, at a temperature of from 60° to 90°, undergoes acetic fermentation, and it was maintained by Leuret and Lassaigue that a similar change took place in the stomach. It appears, however, that only a small part of the alcohol undergoes this change; and it is the small part thus changed which produces the penetrating and disagreeable acidity which characterises the eructations and vomited matters of drunkards. Alcohol is, however, for the most part, rapidly absorbed in an unchanged state, either in the form of liquid or vapour; and this absorption may take place through the cellular (or connective) tissue, the serous cavities, the lungs, or the digestive canal. This is shewn by the experiments of Orfila, who fatally intoxicated dogs by injecting alcohol into the subcutaneous cellular tissue, or by making them breathe an atmosphere charged with alcoholic vapour; and by Rayer, who injected about half an ounce of proof-spirit into the peritoneum of rabbits, which almost immediately became comatose, and died in a few hours. It is, however, only with absorption from the intestinal canal that we have to deal, in relation to man. Almost the whole of this absorption is effected in the stomach, and it is only when alcohol is taken in great excess, or is mixed with a good deal of sugar, that any absorption beyond the stomach occurs. The rapidity of the absorption varies according to circumstances. The absorption is most rapid when the stomach is empty and the drinker is fatigued; while the action is delayed by a full stomach, and especially by the presence of acids, tannin, or the mucilaginous and saccharine ingredients of many wines. Fatty matters have a similar action, and hence it is that (as we learn from Dr Ferrin's elaborate article on 'The Physiology of Alcohol,' in the *Dictionnaire Encyclopédique des Sciences Médicales*, vol. ii. p. 577, 1865) 'we must account for the English habit of taking a very fat soup, or even a glass of oil, before proceeding *aux libations*.' The mode of action of alcohol on the system, and the various phenomena of drunkenness, are sufficiently described in the article INTOXICATION. Previously to the year 1860, the actual presence of alcohol in the blood had been

attempted to be proved by many chemists, but no satisfactory evidence upon this point had been adduced; and its presence had also been sought for in the expired air and in the secretions, but the results were equally doubtful; and Liebig's view, that alcohol was oxidised in the blood, and after passing through various stages of oxidation, was finally converted into, and eliminated from, the system as carbonic acid and water, was almost generally accepted. In that year, however, an elaborate work, abounding in well-devised experiments, and entitled, *Du Rôle de l'Alcool et des Anesthésiques dans l'Organisme*, was published by three well-known physiological inquirers, MM. Lallemand, Perrin, and Duroy, and received a prize, with high commendation, from the Academy of Sciences. In this work, it seems to be proved beyond all doubt that 'alcohol stays for a time in the blood, that it exercises a direct and primary action on the nervous centres, whose functions it modifies, perverts, or abolishes, according to the dose; that neither in the blood nor in the expired air are any traces to be found of its transformation or destruction; that it accumulates in the nervous centres, and in the liver; and that it is finally discharged from the system by the ordinary channels of elimination.'—Perrin, *op. cit.*, p. 580. So far from carbonic acid being one of its final products, it is now ascertained that alcohol causes a diminished exhalation of that gas. The alcohol, when it has entered the blood, is diffused over the whole organism, remains during, apparently, different periods in different organs, and almost immediately begins to escape; and if as much wine or spirit is taken as contains 80 grammes, or rather more than 2½ ounces of alcohol, the urine passed some hours afterwards yields, by distillation, an amount of alcohol capable of burning; and the elimination by this channel continues for 16 hours or more. The elimination by the lungs continues for about 8 hours. The authors believe that in man the chief excreting channel is the skin, but they have no *data* to shew how long this elimination is continued. They further shew that, when a quantity of *vis ordinaire*, equivalent to half an ounce of alcohol, has been taken by a healthy man, the presence of alcohol may be readily detected in the blood, the expired air, the urine, and the cutaneous exhalation in the course of half an hour after the wine has been taken. In animals destroyed when intoxicated, the portions of the brain and of the liver are found to yield, weight for weight, considerably more alcohol than the blood. The fact of the retention and accumulation of alcohol in the nervous centres and liver, tends to throw much light on the special diseases of drunkards.

The action of any kind of alcoholic drink in moderate doses, is that of a somewhat rapid stimulant. The bodily and mental powers are for a time excited beyond their ordinary strength, after which there is a corresponding depression. Although the alcohol which is introduced into the system cannot act as a true food (for in that case it would not pass through the system unchanged), it indirectly takes the place of food, by diminishing the wear and tear of the system, and thus rendering less food sufficient: a fact which is proved by chemical experiments, shewing that less carbonic acid and urea (which are the ultimate products of the carbonaceous and nitrogenous tissues) are given off when alcohol is administered in moderation, than when it is totally withheld.

The influence of an excessive dose of alcohol has been demonstrated by various series of experiments on animals, and unfortunately by many observed cases in man. If a poisonous dose of alcohol is

given to an animal (a dog, for example), its action on the nervous system is the first point that is noticed. The dog ceases to exhibit the ordinary control over its muscular movements, which seem to be no longer under the influence of the will. It walks with uncertain and doubtful steps, till the hind-legs lose their power, the fore-legs still preserving some activity. The general sensibility becomes more or less abolished, and the animal can no longer see or feel. Soon afterwards, the respiration fails; and finally, the circulation is arrested, and life ceases with the last beat of the heart.

As cases are of frequent occurrence in which it is almost impossible for non-professional persons (the police, for example) to distinguish between extreme drunkenness and certain other morbid conditions, as apoplexy, concussion of the brain, and opium-poisoning, it may be practically useful if we lay down a few rules on this subject. In concussion and in very extreme intoxication, there is profound coma or sleepiness; but in the latter case, the odour of the breath removes all difficulty of diagnosis. The most difficult cases are those in which the symptoms of concussion or apoplexy are associated with an alcoholic odour of the breath; in such cases, the head should be most carefully examined for marks of violence, and every effort should be made to obtain a history of the case from those who had previously seen the patient. In poisoning by opium or laudanum, the peculiar smell of the drug may generally be detected in the breath (a test which, however, fails if morphia has been taken). In poisoning by opium, the face is pale, and the pupils of the eyes are contracted; while in drunkenness, the face is flushed, and the pupils are generally dilated. Another difference (to which Dr A. S. Taylor calls attention) is this—that while perfect remissions are rare in poisoning by opium, in poisoning with alcohol the patient often recovers his senses, and subsequently dies. In either kind of poison, the stomach-pump should be used, and the ejected contents of the stomach may facilitate our diagnosis. A sulphate of zinc emetic should be prescribed, if there is no stomach-pump at hand; and after the stomach has been well cleared out, coffee and other strong stimulants should be given.

ALCOHOLS. During the last few years, our knowledge of the properties of ordinary alcohol and of the general class of bodies to which the term *Alcohols* is applied, in consequence of their resemblance, in certain chemical reactions, to ordinary alcohol, has been very much enlarged. We shall first make a few supplementary additions to the article **ALCOHOL**, and shall then proceed to notice the class of *Alcohols*.

In the article **SYNTHESIS**, a method is described by which Berthelot artificially formed alcohol from inorganic compounds. He has since devised another method, which throws much light on the nature of the composition of this substance. On combining the hydro-carbon ethylene, or olefiant gas (C_2H_4), with hydriodic acid (HI), we obtain iodide of ethyl (C_2H_5I); and by prolonged boiling with caustic potash, the former compound may be converted into alcohol, as is shewn in the equation,*

Here it is seen that the iodine of the iodide of

* We have expressed the substances in the following equation in accordance with the theory of types, because the substitution of the ethyl for the potassium is thus more clearly seen than in the corresponding equation, $C_2H_5I + 2KO = C_2H_5O_2 + KI$.

ethyl abstracts the potassium from the hydrate; while the group C_2H_5 , which constitutes ethyl, is substituted for the metal. Alcohol may thus be regarded as a hydrate analogous to hydrate of potash; and if the latter is regarded as water in which one atom of hydrogen has been replaced by one of potassium, so alcohol may be regarded as water in which one atom of hydrogen has been replaced by the monatomic radical ethyl. Hence, while alcohol was regarded, according to the compound radical theory, as hydrated oxide of ethyl, $C_2H_5O_2HO$, it is now regarded, according to the old theory of Types (q. v.), as water in which one atom of hydrogen is replaced by one atom of ethyl, C_2H_5 , and is expressed by the formula $\begin{array}{c} C_2H_5 \\ \text{H} \end{array} \text{O}_2$.

The action of oxygen on alcohol requires a brief notice. In a nearly anhydrous state, alcohol has little tendency to oxidation, but when freely diluted, and exposed to the air, it rapidly becomes oxidized into acetic acid, a result shewn by the equation,

This conversion is, however, not a direct one, an intermediate compound, termed Aldehyde (q. v.), being first formed, which is rapidly oxidized into acetic acid. The oxidation of alcohol into aldehyde is represented by the equation,

while the further oxidation of aldehyde into acetic acid is represented by

Chlorine and alcohol react singularly on each other—the final products being hydrochloric acid, and a very remarkable colourless oily fluid of a peculiar penetrating and irritating odour, called chloral, which is represented by the formula, C_2Cl_2HO . Dilute alcohol distilled with chloride of lime (bleaching-powder), yields chloroform; and this is the most economical process for obtaining this invaluable compound. Heated with an excess of sulphuric acid, alcohol loses all its oxygen in the form of water, and is converted into ethylene, the result being shewn by the equation,

A less complete dehydration, under the action of sulphuric acid, converts alcohol into ether. The process is a complicated one, but the final result is expressed by the equation,

The best tests for discovering the presence of alcohol are—1. Its hot pungent taste, its odour, and its great volatility. 2. Absorbed in asbestos, it burns with a pale blue flame, which deposits no carbon on white porcelain; and when burned in the mouth of an inverted test-tube, containing a few drops of solution of baryta, it produces a well-marked deposit of carbonate of baryta—carbonic acid and water being the products of its combustion. 3. It dissolves camphor. 4. It sets free green oxide of chromium when boiled with a few drops of a saturated solution of bichromate of potash, mixed with sulphuric acid. The chromium test, originally discovered by Dr Thomson in 1846, is that on which

the French physiologists Lallemand, Perrin, and Duroy relied in their investigations regarding the presence of alcohol in the blood, urine, expired air, &c.—See ALCOHOL, PHYSIOLOGICAL ACTION OF.

Alcohol is of a double use to the chemist, inasmuch as it furnishes a cleanly and valuable fuel when used in the spirit-lamp, and possesses remarkable solvent powers without in general exerting chemical action on the dissolved substances. It dissolves many of the gases more freely than water, as, for example, nitrous oxide, carbonic acid, phosphuretted hydrogen, cyanogen, and the hydrocarbons, as, for instance, ethylene. Amongst the mineral substances which it dissolves may be mentioned iodine, bromine, boracic acid, the hydrates of potash and soda, the chlorides of calcium, strontium, magnesium, zinc, platinum, and gold, the perchloride of iron, corrosive sublimate, the nitrates of lime, magnesia, &c.; whilst amongst organic matters, it dissolves many organic acids, bases, and neutral bodies, the resins, the soaps, and the fats, which latter, however, dissolve more freely in ether than in alcohol. The alcoholic solutions of substances used in medicine are called *Tinctures*.

In the article POLYATOMIC ALCOHOLS (q. v.), the general characteristics of the class of bodies now known as alcohols are briefly given. The term *alcohol* is now so far extended as to include all neutral compounds of carbon, hydrogen, and oxygen, which react upon acids in such a way that water is eliminated while ethers are produced. We shall endeavour to elucidate the nature of the different classes of alcohols by giving one example of each principal kind. In a *monatomic alcohol* (see POLYATOMIC ALCOHOLS), half the hydrogen in the primary type for

water, $\frac{H}{H} \left\{ O_2 \right.$, is replaced by an organic radical; thus, in methyl-alcohol, or wood-spirit, one equivalent of hydrogen, H, is replaced by one equivalent of the organic radical methyl, C_2H_5 —the formula for methyl-alcohol being $\frac{C_2H_5}{H} \left\{ O_2 \right.$, or $C_2H_5O_2$; while in ordinary vinic or ethyl-alcohol, there is a similar replacement by the radical ethyl, C_4H_9 —the formula for this (the ordinary) alcohol being $\frac{C_4H_9}{H} \left\{ O_2 \right.$, or $C_4H_9O_2$.

The *monatomic alcohols* are more abundant than all the polyatomic alcohols together. There are several series of them, of which the most important are alcohols whose radical is of the form $C_{2n}H_{2n+1}$ (as $C_2H_5, C_4H_9, C_6H_{13}$), and which are represented by the formula $\frac{C_{2n}H_{2n+1}}{H} \left\{ O_2 \right.$. Of these,

twelve are at present known. They are intimately related to the fatty acids, whose general formula is $C_{2n}H_{2n}O_2$, which may be formed from the alcohol by oxidation—O, being substituted for H. Thus, alcohol, represented generally by $\frac{C_{2n}H_{2n+1}}{H} \left\{ O_2 \right.$, yields the fatty acid represented by $C_{2n}H_{2n}O_2$; for example, methyl-alcohol, $\frac{C_2H_5}{H} \left\{ O_2 \right.$, yields formic acid, $C_2H_4O_2$; ethyl-alcohol, $\frac{C_4H_9}{H} \left\{ O_2 \right.$, yields acetic acid, $C_4H_8O_2$, and so on. The three highest alcohols of this set, whose formulæ are $\frac{C_{28}H_{57}}{H} \left\{ O_2 \right.$, $\frac{C_{30}H_{61}}{H} \left\{ O_2 \right.$, and $\frac{C_{32}H_{65}}{H} \left\{ O_2 \right.$, known as cetyllic, cerotyllic, and melissyllic alcohols, are solid waxy or fatty matters. There is one alcohol whose radical is $C_{10}H_{17}$, and whose formula is $\frac{C_{10}H_{17}}{H} \left\{ O_2 \right.$ —viz., the solid substance known as Borneo Camphor (see RESINS); and in cholesterin (an ingredient of the bile), whose formula is $\frac{C_{25}H_{41}}{H} \left\{ O_2 \right.$, the radical is $C_{25}H_{41}$. *Diatomic alcohols* belong to the

secondary water type, $\frac{H_2}{H_2} \left\{ O_4 \right.$, in which, as before, half the hydrogen, H₂ (which, in this case, is two atoms), is replaced by one atom of a compound radical. The radical is often marked with two

daashes in such cases as these, to indicate that one of its atoms replaces two of hydrogen. Thus, the most important diatomic alcohol, glycol, is represented, according to the theory of types, by the formula $\left(\frac{C_2H_4}{H_2} \right)'' \left\{ O_4 \right.$, its radical being C_2H_4 . In the *triatomic*

alcohols, we take $\frac{H_3}{H_3} \left\{ O_6 \right.$, or the tertiary type of water, and replace half the hydrogen—viz., three atoms, by one atom of an organic radical, which we consequently mark with three daashes. The well-known substance glycerine is the only example of the triatomic alcohols. Its radical is C_3H_5 ; and as this replaces three atoms of hydrogen, its typical formula is $\left(\frac{C_3H_5}{H_3} \right)''' \left\{ O_6 \right.$; its ordinary formula being

$C_3H_5O_6$, which throws no light on its internal constitution. One *tetratomic* and one *hexatomic* alcohol have been discovered.* The former is erythrite, a substance obtained from the litmus lichen; one atom of its radical, C_4H_9 , replaces four atoms of hydrogen, and its typical formula is written $\left(\frac{C_4H_9}{H_4} \right)'''' \left\{ O_8 \right.$;

while the latter is mannite (the chief ingredient of the well-known substance Manna, described in the article SUGAR), in which one atom of the radical, $C_{12}H_{25}$, replaces six atoms of hydrogen, its typical formula being $\left(\frac{C_{12}H_{25}}{H_6} \right)'''''' \left\{ O_{12} \right.$, while its ordinary formula is $C_{12}H_{25}O_{12}$.

We have entered somewhat fully into the consideration of this somewhat difficult subject, because it is one of great general interest, as shewing the close chemical connection between various groups of bodies of apparently totally different natures. No one could have anticipated, ten years ago, that such very different substances as cholesterin and mannite were allied to ordinary alcohol.†

ALCORA, a town of Valencia, Spain, in the province of Castellon, 43 miles north-north-east from Valencia. It is tolerably well built. Many of the inhabitants are employed in the manufacture of earthenware and the distilling of brandy. Corn, grapes, silk, and hemp are among the principal productions of the neighbourhood. Fruits are a chief article of export. Pop. 5600.

ALDEHYDE ($C_2H_2O_2$) is a volatile fluid produced by the oxidation and destructive distillation of alcohol and other organic compounds. Its discoverer, Döbereiner, called it *light oxygen ether*; its present term is an abbreviation of *alcohol dehydrogenitum*, its composition being represented by that of alcohol from which two atoms of hydrogen have been abstracted. In the article on this subject in Watts's *Dictionary of Chemistry*, ten different modes of obtaining this substance are given. It is sufficient here to state that the best modes of preparing it may be found in that work, or any recent treatise on organic chemistry. It is a thin, transparent, colourless liquid, very inflammable, burning with a blue flame, and having a spec. gr. of 0.8, a boiling-

* A second tetratomic alcohol, propylphycite, $C_6H_8O_8$, has been lately artificially formed by Carius; and dulcitol, which is isomeric with mannite, is now regarded as a second hexatomic alcohol. We mention these facts to shew what constant additions are being made to this class of bodies.

† There can be no doubt that the sugars will soon be universally admitted to be alcohols, as Berthelot suggested a few years ago. In one of our best and latest works on chemistry, Naquet's *Principes de Chimie, fondée sur les Théories Modernes* (2d ed., 1867), cane-sugar, melitose, trehalose, mycose, mélizitose, lactose, and parasaccharose (most of which are described in the article SUGAR, q. v.), are placed under the head of 'Alcohols Polyglucosides.'

point of about 71°, and a pungent, suffocating odour. It mixes in all proportions with water, alcohol, and ether, and dissolves sulphur, phosphorus, and iodine. As is shewn in the article ALCOHOLS, it constitutes an intermediate stage in the oxidation of alcohol into acetic acid. Aldehyde must be regarded as a monobasic acid, inasmuch as it contains one atom of hydrogen replaceable by a metal. Thus, when potassium is gently heated with aldehyde, one atom of H is replaced by one of K, the resulting compound being aldehydate of potash, $C_nH_{2n}KO_2$. Various salts of this kind may be formed, of which the most important is aldehydate of ammonia, or aldehyde-ammonia, $C_nH_{2n}(NH_3)_O_2$, which is obtained in transparent shining crystals, and is a compound that has led chemists to the discovery of a large number of very remarkable derivatives.

ALDEHYDES are a class of organic compounds, intermediate between alcohols and acids; the ordinary aldehyde, described in the preceding article, being, as we have seen, intermediate between ordinary alcohol and its corresponding acid—viz., acetic acid. It has been shewn in the article ALCOHOLS that the compounds of this class related to the fatty acids are represented by the general formula, $C_nH_{2n+2}O_2$, while the corresponding acids have the formula, $C_nH_{2n}O_4$. Each aldehyde is derived from the corresponding alcohol by the abstraction of two atoms of hydrogen, and each aldehyde is converted into its corresponding acid by the addition of two atoms of oxygen. These essential facts are shewn in the equation,

and

Nine aldehydes of the form $C_nH_{2n}O_2$, corresponding to $n = 2, 3, 4, 5, 7, 8, 11, 12,$ and 16 , are at present known, the simplest being ordinary or acetic acid, $C_2H_4O_2$, and the highest being palmitic aldehyde, $C_{16}H_{32}O_2$. It is obvious that, as far as is yet known, there is not of necessity always an aldehyde intervening between the alcohol and corresponding acid; for example, methylic and caproic alcohols have not yet yielded an aldehyde.

Amongst aldehydes not connected with the preceding group may be mentioned various organic compounds which have been recently shewn to belong to this class—thus, acrolein, $C_3H_4O_2$, is acrylic aldehyde; camphor, $C_{15}H_{16}O_2$, is campholic aldehyde; bitter-almond oil, $C_{11}H_{16}O_2$, is benzoic aldehyde; oil of cumin, $C_{11}H_{16}O_2$, is cuminic aldehyde; oil of cinnamon, $C_{12}H_{16}O_2$, is cinnamic aldehyde; salicylic acid, $C_7H_6O_4$, is salicylic aldehyde; and anisylous acid, $C_{10}H_8O_4$, is anisylaldehyde. Most of these aldehydes are obtained directly from plants, and either exist in them ready formed, or are given off as volatile oils on distillation with water.

For the best account of the aldehydes with which we are acquainted, we must refer to the chapter on that subject in the second edition (1867) of Naquet's *Principes de Chimie, fondée sur les Théories Modernes*, vol. ii. pp. 384—405, in which will be found a full account of the aldehydes derived from the monatomic alcohols, of the modes of preparing them, of the properties common to all aldehydes, and those specially belonging to different series, the rational formulæ and constitution of aldehydes, and the aldehydes derived from diatomic alcohols or glycols, in which this chemist includes not only salicylic, salicylic, and glycolic aldehydes, but that remarkable synthetic product, Furfural (q. v.).

ALDROVANDI, ULYSSES, one of the most distinguished naturalists of the 16th c., was born at Bologna, probably about the year 1522. He was descended of a noble family, and received an excellent education, partly in his native city and partly at Padua. Some of his religious opinions having been called in question, he travelled to Rome in 1550, to vindicate himself; and whilst there, studied Roman antiquities, and wrote a treatise on ancient statuary. At Rome, he formed the acquaintance of Rondelet. On his return home, he devoted himself to the study of botany, and having taken his degree in medicine at the University of Bologna in 1563, he was in the following year appointed to the chairs of Philosophy and Logic, and also to the lectureship on Botany. He practised medicine for some time in Bologna, and appears after a short time to have exchanged some of the chairs which he held in the university for that of Natural History, to the study of which science he applied himself with great devotedness. He established the Botanical Garden at Bologna in 1567. He was much employed, during many years, in forming a museum of natural history, collecting specimens with great assiduity, and employing draughtsmen to make figures of them for the great work on natural history which he contemplated. In the pursuit of his favourite science, he travelled into different countries, but no particular record of his travels remains. Inspiring others with a zeal similar to his own, he had the pleasure of seeing his museum rapidly increase. He finally bequeathed it to the Senate of Bologna, and it became the foundation of the splendid public museum of that city, where many of A.'s specimens remain to this day. He left behind him, also, at his death, a prodigious mass of valuable manuscripts, which still remain in the public library of Bologna, a store of which proper use has never yet been made, and in which there is probably much correspondence of eminent men, interesting as shewing the first steps of progress of the science of natural history, after the long dormancy of the middle ages. All his studies and collections were made subservient to his work on Natural History, the first volume of which—on Birds—appeared in 1599. Six volumes appeared during A.'s life; other seven were published under the direction of his colleagues and pupils after his death, which took place in 1605. It has been stated in many notices of his life, and was long commonly believed, that, by his scientific pursuits, A. reduced himself to circumstances of great poverty, and that he died in a public hospital at Bologna; but the story, although Bayle has adopted it in his Dictionary, rests on no sufficient evidence, and there is reason to think that it is not true. It is difficult to procure a complete edition of the works of A., and the volume on Minerals is especially rare. A. has been censured for excessive copiousness in things of little importance, and at best merely serving to illustrate his subject and render it interesting. He shews, however, great anxiety to set forth all that is known on every subject of which he treats; he writes of natural history in a way which shews that he greatly loves the science, and at the same time with a devout and reverent spirit, always beholding in the works of creation the traces of the Creator's hand.

ALDSTONE, or ALSTON, sometimes called ALSTON MOOR, a market-town of the county of Cumberland, England, 30 miles east-south-east from Carlisle. The parish of A. contains extensive and very productive lead mines, formerly belonging to the Earls of Derwentwater, and now to the Lords Commissioners of the Admiralty. The town has manufactures of worsted yarns and flannel. It is situated in a mountainous district, on the declivity

of a steep hill, near the confluence of the Nent and South Tyne. It is connected by a branch with the Newcastle and Carlisle Railway. Pop. in 1861, 2918; in 1867, about 2700.

ALESSANDRIA DELLA ROCCA, a town of Sicily, in the province of Girgenti, and 17 miles north-by-west from Girgenti, picturesquely situated in a mountainous district. Pop. of commune, 5214.

ALEWIFE (*Alosa tyrannus*), a fish of the same genus with the Shad (q. v.), which, in the end of spring and beginning of summer, appears in great numbers on the eastern coast of North America, and enters the mouths of rivers to spawn. It appears in Chesapeake Bay in March, on the coasts of New York and New England in April, and on those of the British provinces about the 1st of May. It abounds in the Bay of Fundy, but is more rare in the Gulf of St Lawrence; and the Bay of Miramichi appears to be its northern limit. It ascends rivers only as far as the tide extends, and after spawning, returns to the sea in the middle of summer. It prefers a soft, muddy bottom. Its length is not more than 12 inches. The A. is called *Spring Herring* in some places, and *gasperow* by the French Canadians. It is inferior to the herring, yet it is a valuable fish. The fishery is prosecuted in the rivers, by small-meshed seine-nets, set across the stream. Large quantities are taken in the rivers of New England, New Brunswick, and Nova Scotia. The harbour of St John's, New Brunswick, alone produces from 12,000 to 20,000 barrels annually. This fish, in a salted state, forms a considerable article of export from the northern parts of America to the West Indies.

ALEXANDRI, or **ALEKSANDRI**, **VASILIO** (Basil), a Rouman poet and *littérateur*, was born at Jassy, the chief city of Moldavia, in 1821. His family was of Venetian origin. After spending several years at a French boarding-school at Jassy, he was sent, in his fourteenth year, with a tutor to Paris; and in due course he obtained from the University of Paris the degree of Bachelor of Letters. He is said to have thereafter made trial in succession of the study of medicine and the study of law, and to have found neither of them to his liking; he certainly followed up neither, but without qualifying himself for any profession, went back to Jassy in 1839. He found at Jassy a band of young men educated, as he himself had been, in France, whose minds had been formed upon the literature and the political ideas of France; who, besides being ambitious of literary distinction, were zealous for political equality and for Rouman nationality and independence. He naturally became the associate of these men; and soon after his return, made his *début* in literature by contributing a story, *The Flower-girl of Florence*, to a periodical conducted by them under the editorship of Cogalniceano. He became a frequent contributor to this periodical. Unfortunately, it was not destined to live long, being suppressed by order of Prince Stourdza. It was in 1842, after a long excursion among the mountains of his native province, that he first made his appearance as a poet, publishing several pieces, most of them strongly tinged with national feeling. At this time, too, it was that he began to write the songs and ballads upon which his chief claim to literary reputation at present rests. In 1844, he suddenly attained to an almost unbounded local popularity as a play-writer. Having become concerned in the management of two theatres at Jassy, the one French, the other Moldavian, he produced a series of pieces, some in French, others in Rouman, which, though mostly slight and hasty performances, had merit enough to excite the

enthusiasm of his countrymen. *Georges de Sadagoura*, *Jassy en Carnaval*, *La Pierre de la Maison*, *La Noce Villageoise*, are the titles of the most important of them. In 1844, he had also, in conjunction with Cogalniceano and Prince John Ghika, set on foot a new periodical, devoted to literature and science; but this, like the one already mentioned, was not suffered to live long—it was suppressed by the government, after a career of only nine months.

A. was engaged in the revolutionary movement which took place at Jassy in the year of revolutions, 1848, and on its failure, had to betake himself for a time to Paris. There, through the press, during the short period of his exile, he laboured to arouse public opinion in favour of the independence of the Roumans; and his efforts, though they were unsuccessful at the time, helped, with those of others, to prepare the way for what took place several years after. It was to the Russian war that Moldavia and Walachia were destined to owe their virtual emancipation from the yoke of Turkey, and the chance of obtaining self-government and union. The union of the two principalities was carried by the resolution of their inhabitants, backed by the support of France, in spite of political obstacles that seemed almost insurmountable; and A. did not a little to inspire the resolution of his countrymen. A song which he wrote at the critical moment in 1856, *The Hour of Union*, became exceedingly popular, and, by its stirring appeals to the feeling of Rouman nationality, helped to allay the jealousies which divided the two principalities, and to make them work together for the union. A. took a prominent part in all the political transactions which culminated in this result. It should be stated, that two years earlier, when the death of his father had put him into possession of the family estate, he had emancipated the serfs who lived upon it; and that this example found so many imitators that the government found itself almost immediately compelled to decree a general measure of enfranchisement.

A.'s *Popular Ballads of Roumania*, which he had begun to compose in 1842, appeared at Jassy in two parts in 1852 and 1853. One of the parts, translated into French by himself, was afterwards published at Paris under the title of *Ballades et Chantes Populaires de la Roumanie*. His collected dramatic works were published at Jassy in 1852. Another volume of poems appeared at Paris in 1853; and of this volume a French translation, with the title, *Les Doïnas, Poésies Moldaves*, was soon afterwards produced by M. Vanesco. *Le Collier Littéraire*, a miscellaneous collection of pieces in prose and verse, many of which had previously appeared in periodicals, he published in 1857. A., as may be inferred from facts already stated, has written largely in periodicals, but mostly upon subjects of passing interest. All his works, besides their intrinsic merits, which are very considerable, are interesting from the connection they have with the growth of a national feeling among the Roumans.

ALEXANDRIA, a town of Dumbartonshire, Scotland, on the west bank of the Leven, opposite to Bonhill, three miles from Dumbarton, on the Glasgow, Dumbarton, and Vale of Leven Railway. It is a town of recent growth, of a neat and pleasing appearance, in the midst of beautiful scenery. It has extensive cotton-printing works, and other public works. Pop. in 1861, 4242.

ALFONSINÉ, a town of Italy, in the province of Ravenna, nearly four miles north-west from Ravenna, in a level, irrigated, and fertile district. Pop. of commune, 6741.

ALFRETON, a market-town of Derbyshire, England, 12 miles north-north-east from Derby, and one mile and a half east from the Derby and Leeds Railway. It has manufactures of hats, stockings, and brown earthenware. There are collieries and iron-works in the vicinity. The town is irregularly built, and contains many very old houses, but has of late rapidly increased. It is said to derive its name from Alfred the Great. Pop. (1861) 4090.

ALHAMA (Arab. *The Bath*; the Roman *Astigia Juliensis*), a town of Andalusia, Spain, in the province of Granada, 25 miles south-west from Granada. Its situation is extremely picturesque, on the edge of a projecting rock, overhanging a deep chasm of limestone hills, through which the river Marchan foams, and with mountains in the background rising to the height of 8000 feet. Vineyards and gardens mingled with the houses on the steep slopes add to the interest of the scene. A. is a decayed town, although its warm sulphureous baths are still frequented by visitors in the beginning and end of summer. The Moors derived a large revenue from its baths. It was a famous fortress of the Moors; and its capture, in 1482, prepared the way for that of Granada. There are still remains of the Moorish castle and town wall. There are ruins also of a Roman aqueduct: the principal bath still in use is a Moorish edifice; and a smaller one is supposed to be Roman. Pop. 6284.

ALHAMA, a town of Murcia, Spain, 17 miles south-west from Murcia. It is celebrated for its warm mineral waters, and is resorted to for bathing. It has a ruined castle. Pop. 6935.

ALHAURIN EL GRANDE, a town of Granada, Spain, in the province of Malaga, and 19 miles west from Malaga, on the north side of the Sierra de Mijas, and near the Faala, an affluent of the Guadalherce. It is a well-built town, with a number of squares, wide well-paved streets, and many fountains. There are remains of a Roman aqueduct and of an Arab fortification. Many of the inhabitants are employed in working the marble, freestone, and granite quarries of the vicinity, and its lead and antimony mines. Pop. 5514.

ALIA, a town of Sicily, in the province of Palermo, 30 miles south-east from Palermo, picturesquely situated on the crest of a hill, in a mountainous and craggy district, near a torrent called the Fiume Torto. Pop. 5425.

ALICATA, or **LICATA**, a town of Sicily, in the province of Girgenti, and 26 miles south-east from Girgenti. It is most beautifully situated on the sea-coast, at the mouth of the Salsa (anc. *Himera Meridionalis*), one of the largest rivers, if not the largest, in Sicily; its buildings stretch along the shore, and occupy the steep slope of the hill, which is crested by the great old fortress, now indeed of little strength, but of imposing appearance. On the brow of a hill to the west of the town, is the dismantled castle of St Angelo, said to occupy the site of that in which the tyrant Phalaris kept the brazen bull, his celebrated instrument of torture. A. itself is generally believed to stand on the spot where the ancient *Phintias* was built (280 B.C.) by Phintias, tyrant of Agrigentum, after he had destroyed Gela, the inhabitants of which he transferred hither. The place and immediate neighbourhood were the scene of some memorable battles in the wars between the Carthaginians and Sicilians, and between the Carthaginians and Romans. In the middle ages, A. suffered severely from the depredations of Barbary corsairs. It has a very bad port, the sea being so shallow that only vessels of small size can approach the town; larger vessels

are compelled to anchor about a mile from the town, and are loaded and unloaded by the aid of small craft. Yet A. has a considerable trade, exporting corn, macaroni, fruit, almonds, pistachio-nuts, sulphur, soda, and wines. Pop. 14,338.

ALL SOULS' COLLEGE, Oxford, was founded in 1437 by Henry Chichele, sometime Fellow of New College, and successively Bishop of St David and Archbishop of Canterbury, for a warden, 40 fellows, 2 chaplains, and clerks. However, by an ordinance framed by the commissioners appointed under the statute 17 and 18 Vict. c. 81, ten of the fellowships have been suppressed in order to the endowment of two professorships, to be called 'the Chichele Professorship of International Law and Diplomacy,' and 'the Chichele Professorship of Modern History.' The remaining fellowships are open to all, irrespective of birth (date or place), position, or profession, provided only the candidates have passed all the examinations required for B.A., and have obtained either some prize or scholarship open to general competition, or a 'first-class' place in one of the public examinations of the university. The candidates also must be examined in Jurisprudence and Modern History. The patronage includes 19 benefices, situated in Kent, Oxford, Essex, Gloucester, Berks, Bucks, Herts, Northampton, Salop, Surrey, and Wilts, of an annual value of £7925. In 1866, this college had 101 members of convocation, and 117 on the books.

ALLYL (Lat. *allium*, garlic) is an organical radical, represented when in combination by C_3H_5 , and when in the free state by C_3H_7 . The first compound discovered was iodide of allyl, which was obtained by Berthelot and De Luca in 1854; two years later, they isolated allyl; and shortly afterwards, Wurtz demonstrated its existence in the oils of mustard and garlic. Its properties, and those of some of its most important compounds, are described in the article **GARLIC**, **OIL OF**.

ALMADA, a town of Portugal, in the province of Estremadura, on the south bank of the Tagus, opposite to Lisbon, and distant from it less than two miles. There is frequent steam-communication with Lisbon. A. is built upon a height, from the summit of which, above the town, there is a magnificent view of Lisbon and the Tagus. A. has a strong castle on a rock. The surrounding country is well cultivated. A. has long been celebrated for its figs. Near it is the gold mine of Adissa. Pop. 5500.

ALMAGRO, a town of New Castile, Spain, in the province of Ciudad Real, and 13 miles east-south-east from Ciudad Real. It is situated in a high arid plain, but is very well built, with wide paved streets, a fine square, and a public walk lined with trees. Its most noteworthy building is an old church of beautiful architecture. It is a place of greater activity than most Spanish towns, and its whole appearance indicates prosperity. Brandy, soap, and earthenware are manufactured, and lace-making gives employment to about 8000 women in A. and the neighbouring villages. The surrounding country is celebrated for its mules. There are two great annual fairs, at which mules and lace are sold. Pop. 12,605.

ALMANSA, a town of Murcia, Spain, in the province of Albacete, and 43 miles east-by-south from Albacete, on the Madrid and Alicante Railway. It is situated in a wide plain, and is tolerably well built, and rather flourishing. The *vega*, or plain around the town is irrigated by water from a large reservoir called the *Pantano of Albufera*, and is very fertile. Many of its ague-breeding swamps have been drained and brought under cultivation.

A. carries on manufactures of linen, hempen, and cotton fabrics, the materials of which are supplied from the neighbourhood, also of brandy, leather, and soap. Pop. 8736.—Near A. the French, under the Duke of Berwick, natural son of James II. of England, gained a victory, on 25th April 1707, over an army of Spanish and English troops, commanded by Henry de Ruvigny, Earl of Galway. The French were more than twice the number of their opponents. Ruvigny fought under orders from home, contrary to his own judgment, and was deserted by the Spaniards almost as soon as the battle began. The battle of A. was, in its results, one of the most important in the War of the Spanish Succession. See SUCCESSION WARS.

ALMAS, a town of the Austrian Empire, in the Woiwodina, 16 miles west from Maria Theresiopol. The inhabitants are almost all Roman Catholics. Pop. 8000.—Almas is the name of many small towns and villages in Hungary.

ALMAZORRA, a town of Valencia, Spain, in the province of Castellon, four miles south-by-east from Castellon de la Plana, in a plain on the left bank of the Mijares, three miles from its mouth. It has some wide and well-paved streets and squares. Linen and woollen fabrics and paper are manufactured. The surrounding country is fertile, producing wheat, barley, maize, oil, oranges, &c. Pop. 5150.

ALMODOVAR DEL CAMPO, a town of New Castile, Spain, in the province of Ciudad Real, 22 miles south-west from Ciudad Real. It stands on the summit of a ridge, near the Vega, a branch of the Guadiana. The streets are tolerably clean, but ill paved. There are ruins of an ancient castle. The inhabitants are chiefly employed in agriculture, and the only manufactures are domestic. Pop. 5620.

ALMORA, the principal town of the British district of Kumaon (q. v.), India, 87 miles north from Bareilly, on the crest of a mountain ridge, 5337 feet above the sea, on the head-waters of the Kosila, a branch of the Ramgunga. It consists chiefly of one street, three-quarters of a mile long. The houses have a ground story of stone; the upper stories are of wood, covered with a sloping roof of heavy gray slate, on which small stacks of hay are sometimes erected. The ground story is generally white-washed and tricked out with grotesque paintings. Detached houses, both of Europeans and Brahmans, are scattered along the face of the mountain below the town. A. is a British military station, the lines of the regular troops and Fort Moira being close to the town. Since it came under British sway, it has been rapidly increasing in prosperity.

ALMORAVIDES ('The *Moravides*'), or MORABETHUN, the name of an Arab dynasty that ruled in Africa and Spain in the 11th and 12th centuries of the Christian era. The name A., which is commonly given to this dynasty by Western writers, is a corruption of the Arabic word *Al-morabeth*, 'the champion of religion.' This sect took its rise about 1050 among the Arab and Berber tribes which dwelt on the slopes of the Atlas range facing the Atlantic, and was founded by a Moslem teacher called Abdalla-ben-Yasim, who undertook to rescue these tribes from the gross ignorance in which they were plunged, and instructed them in the doctrines of the Mohammedan faith. The new proselytes soon exhibited the fruits of this teaching by descending from their hills, under the leadership of a chief named Abu-bekr, and conquering the kingdom of Fez. The adjoining kingdom of Morocco shared the same fate; and the victorious enthusiasts, under the famous Yussuf-ben-Taxfin, the cousin of

Abu-bekr, next crossed the Strait of Gibraltar, and subdued Spain to the Tagus on one side, and to the Ebro on the other. But this extensive and powerful dominion was of too rapid growth to possess much stability; and during the reign of Ali, the son of Yussuf, arose the sect of the Almohades (q. v.), which after a time expelled the A. from Africa, and in 1144 subdued their power in Spain. It was the Almoravide princes who introduced the *Maravedi* (q. v.) into Spain, and in that and the word *Marabuts* (q. v.) their name is still preserved.

ALMUÑECA'R (Arab. *Al Munneca'b*, the gorge), a seaport town of Andalusia, Spain, in the province of Granada, 31 miles south of Granada. The port is somewhat exposed. The town is generally well built. It was a place of importance in Moorish times, when the coast of Granada was highly cultivated and extremely productive, particularly in sugar and cotton. Efforts have recently again been made to extend the culture of both. The inhabitants of A. are chiefly engaged in agriculture and sugar-refining. There is a considerable trade in cotton, sugar, and fruit. Pop. 5000.

ALORA, a town of Andalusia, Spain, in the province of Malaga, 18 miles north-west of Malaga, on an elevated site near the right bank of the Guadalherca. Some of the streets are well built and well paved; some are very steep and irregular. There are ruins of an ancient Gothic castle. The inhabitants are mostly employed in agriculture. Soap and sulphate of soda are manufactured. The neighbourhood produces much oil and excellent wine. Pop. 6794.

ALPES MARITIMES, a dep. of France, in the extreme south-east, on the shores of the Mediterranean and confines of Italy, formed in 1860, of the ancient county of Nice, then ceded to France, and formerly belonging to the kingdom of Sardinia, and of the arrondissement of Grasse, detached from the department of Var. The chain of the A. M. forms the northern boundary of the department, and from it numerous spurs run seaward, among which are lovely and fertile valleys. The chief rivers of the department are the Loup, the Var, and the Pailon, at the mouth of which Nice is situated. The climate is mild and pleasant in the vicinity of the sea, and in the lower valleys, although the higher mountains reach to altitudes where winter always reigns. The vine and olive are much cultivated in the more favoured localities; oranges, lemons, and figs are produced in abundance and of excellent quality; a considerable extent of land is devoted to tobacco, and not a little to the cultivation of herbs and flowers for the preparation of essences and perfumes. Grasse is particularly famous for the manufacture of perfumery. In many parts of the department, there are noble forests. In the more elevated parts, much land is used for the pasture of sheep, and also of goats, of which these regions possess a highly esteemed breed. The silk-worm is reared to a considerable extent, and the keeping of bees is a source of no little wealth, honey being largely produced and exported. The mineral riches are not great. There are some quarries of white marble, and some mineral springs. Among the chief branches of industry, besides those which are strictly rural, are brass-founding and the making of bijouterie. The tunny, anchovy, and sardine fisheries give employment to many people on the shores of the Mediterranean, and great quantities of anchovies and sardines are exported from the port of Cannes. The department is divided into three arrondissements—Nice, Puget-Theniers, and Grasse. The capital is Nice (q. v.), and the other

principal towns are Antibes (q. v.), Villefranche, Cannes (q. v.), Grasse (q. v.), and Menton, or Mentone (q. v.), on the eastern frontier.—The county of Nice was bestowed in 1388 on Amadeus VII, Duke of Savoy, and latterly formed part of the kingdom of Sardinia till 1860, except that it was seized by France in 1792, and for a time formed into the department of Alpes Maritimes. It was restored to Sardinia in 1815. After the treaty of 1860 was concluded, it was apprehended that the people of this region, on account of their race, customs, and language, would not shew the same willingness to be transferred to France as the people of Savoy; but no transference of territory was ever more easily accomplished, or with less apparent dissatisfaction of those most nearly concerned. The pop. of the department in 1866 was 198,818.

ALTAI MOUNTAINS. Since the article **ALTAI** was written, the explorations of Russian surveyors have led to a more definite knowledge of the form and limits of this important range, which is now described as a separate system, one of the four parallel chains which constitute the skeleton of Eastern High Asia, covering the great tableland. The A. forms an alpine girdle, intersected by wide valleys traversed by many streams, among which are the Tez river, flowing west to the Ubsa Nor (lake); and the Kobdo, flowing south to the Tke Aral Lake. The general direction of the range is from west to east, about the parallel of 50° north. It extends between the meridians of 84° and 100° east. On the east, the A. is separated from the Daurian mountain-system by lakes Kosgol and Baikal; on the west, it terminates in the Katunsk Mountains, a small isolated group, in which Mount Beluka rises to 12,790 feet, far above the line of perennial snow, with extensive glaciers on its western flanks. The climate of the A. is not so severe as might be inferred from its position. The winters are frequently mild, and comparatively little snow falls. The mountain slopes are covered with rich grass, and their flanks are in many parts adorned by magnificent cedar forests. Stags, hares, and wolves abound in the lower, and bears in the higher portions of the range. The A. is celebrated for its gold, silver, and lead mines. Barnaul, on the northern slope of the range, is the chief mining town; and the village of Zeminogorski, south of Barnaul, is in the centre of the richest silver mines in the Russian Empire. North of the Ubsa Nor (lake), the Tangu Ula Mountains, connected with the A. on the north, rise to upwards of 11,000 feet. They furnish abundance of white marble of an excellent quality.

ALTAMURA, a town of South Italy, in the province of Bari, and 28 miles south-west from Bari, at the eastern base of the Apennines. It is a well-built and beautiful town, surrounded with walls, and having a magnificent cathedral. The surrounding country is fertile, produces much oil and wine, and abounds in rich pastures. A. is supposed to occupy the site of the ancient *Lupazia*. Many fine Grecian antiquities have been dug up. Pop. (1861) 17,198.

ALTEA, a seaport town of Valencia, Spain, in the province of Alicante, and 25 miles north-east from Alicante. It stands on a rising ground, on the right bank of a small river called the Alga, and at the head of a bay. It has wide streets, but many of them are steep. The inhabitants are mostly engaged in agriculture; some of them are fishers and sailors. Linen fabrics, ropes, and soap are manufactured. Pop. 5502.

ALTENA, a town of Westphalia, Prussia, in the government of Arnberg, 40 miles north-east from Cologne. It stands on the right bank of the Lenne,

in a deep and picturesque valley. It has large public works, the machinery of which is moved by water-power, and manufactures great quantities of needles, pins, and other small articles of hardware. There are also stocking manufactories and tanneries. Pop. 6154.

ALT-OFEN, a town of Hungary, on the right bank of the Danube, about two miles above Ofen or Buda, of which indeed it may be considered a suburb. The towns are almost united. A. is a decayed place, but of great antiquity, and is believed to occupy the site of a Roman town, *Sicambria* or *Aquincum*. Remains exist of a Roman aqueduct, a bath, and an amphitheatre. Attila made this his capital. Pop. 11,730.

ALTON, a town of Hampshire, England, of considerable antiquity, near the Wey, 16 miles north-east from Winchester. It is pleasantly situated among picturesque hills and woods. Most of the houses are of brick, but some are of stone. The principal street forms part of the main road from London to Winchester. The church was erected in the reign of Henry VII., and is in the Perpendicular style. Its tower, older than the rest of the edifice, has massive Norman arches. A branch railway connects A. with the South-western Railway. Bombazines were formerly manufactured here. Good hops are grown in the neighbourhood, and there are large breweries in the town, the ale of which is much esteemed. Pop. (1861) 3769.

ALTON, a city and port of entry of Illinois, U. S., on the left bank of the Mississippi River, 21 miles above St Louis, 3 miles above the mouth of the Missouri River, the terminus of the Chicago and Alton Railway, and centre of a large commerce. The city contains a Roman Catholic cathedral, 10 churches, 2 daily and 2 weekly newspapers, state penitentiary, and numerous mills and manufactories, with an abundant supply of coal and limestone. Pop. (1860) 6333.

ALTOONA, a village of Pennsylvania, U. S., on the Central Railway, at the eastern base of the Alleghanies, 244 miles west of Philadelphia; contains 11 churches, 2 banks, 6 hotels, and large locomotive works and machine-shops. Laid out in 1849. Pop. (1865) 5500.

ALTRINCHAM, a market-town of Cheshire, England, on Bowden Downs, eight miles south-west from Manchester. It is situated on the Cheshire Midland Railway, and near the Duke of Bridgewater's Canal, which has contributed greatly to its prosperity. It is a very neat and clean town, and on account of the salubrity of the air, is much resorted to by invalids from Manchester. It has manufactures of cotton yarns, cloths, and bobbins, but a chief employment of its inhabitants is the raising of fruits and vegetables for the market of Manchester. Pop. (1861) 6628.

ALVA, a village of Stirlingshire, Scotland, pleasantly situated on nearly level ground at the mouth of a romantic glen of the Ochil Hills, 7 miles north-east from Stirling. The part of Stirlingshire in which A. is situated is detached from the rest of the county, and enclosed between the counties of Clackmannan and Perth. A. is a place of great industrial activity, having extensive woollen factories. Formerly the prevailing branch of industry was the blanket trade. In later years this has been entirely superseded by the manufacture of shawls. Tweeds are also being introduced. The number of looms employed is about 1100, the steam-looms having been introduced during the present summer (1867). To the east of the village is a glen, named the Silver Glen, where two pits are still to be seen, marking the site of old silver mines.

The communion cups still in use in the parish church are made of silver derived from these mines.

Immediately behind the town is Alva Glen, noted for its picturesque beauty and magnificent waterfall. About a mile to the west of the village is Balqubarn Glen, also a very romantic spot. Pop. (1861) 3147; at present (1867) above 3500.

ALVARADO, a town of Mexico, in the department of Vera Cruz, on the Gulf of Mexico, at the mouth of the river Alvarado, 50 miles south-east from Vera Cruz. The situation, close to a lagoon, is unhealthy. A bar at the mouth of the river prevents the entrance of vessels of more than 12 or 13 feet draught, but within the bar, the harbour is sheltered from every wind. Great part of the town consists of cane-built cottages, roofed with palm-leaves. The river has a course of not much more than 100 miles, but collects the waters of an extensive swampy district. Much rice and cacao are produced in the country around Alvarado. Pop. 6000.

ALWUR, or MACHERY, a Rajpoot state of India, under the control of the governor-general's agent for the states of Rajpootana, but having a considerable measure of independence. It lies between N. lat. $27^{\circ} 4' - 28^{\circ} 13'$, and between E. long. $76^{\circ} 7' - 77^{\circ} 14'$. Its area is about 3570 sq. miles; its pop. estimated at 280,000. The capital, Alwur, is a small ill-built town, surrounded by a wretched mud wall, situated at the base of a rocky range of quartz and slate, 1200 feet above the adjacent country, and at least 2100 feet above the sea, 94 miles west-north-west from Agra. The palace of the Rao Rajah is a curious square building, having its walls pierced with a great number of small windows, and covered with glaring and grotesque paintings. The revenue of the Rao Rajah is estimated at about £180,000. The military force of the state amounts to about 3000 infantry and 4000 cavalry. The inhabitants, who are called Mewattis, are a rude and savage race. In former times, the Mewattis were a predatory tribe, and from the 13th to the 15th c., carried their raids even to the gates of Delhi.

AMARA'NTÉ (anc. *Ante Moranam*), a town of Portugal, in the province of Minho, on the Tamega, a branch of the Douro, 32 miles north-east from Oporto. The Tamega is crossed by a handsome stone bridge. The town is well built, but dull and decayed. A church, erected in the 16th c., is an interesting specimen of the Flamboyant style. A. was the scene of a fierce conflict between the French and the Portuguese in 1809, when the bridge was defended by the Portuguese for several days, and the French committed great barbarities. Pop. 5500.

AMA'SIA, AMASIEH, or AMASIA YAH (anc. *Amasia*), a town of Asia Minor, the principal town of the pashalic of Sivas, on the right bank of the Yeshil-Irmak, about 80 miles from the mouth of the river, and 200 miles south-west from Trebizond. It stands in a deep and narrow valley, and the river flows through a narrow channel, between precipitous rocky banks. The streets are narrow and crooked; the houses mostly of wood, although some are of stone, all covered with tiles. The river is crossed by three stone bridges, and one wooden bridge. One of the stone bridges is supposed to be Roman. The ancient town, the birthplace of Strabo, occupied both banks of the river, and the remains of the Acropolis crown a lofty rock on the side of the river opposite to the present town. There are numerous other interesting remains of antiquity, particularly the tombs of the kings of Pontus, whose capital A. was, excavated in the

face of a steep rock, and some Saracenic buildings. Water is raised from the river by means of wheels driven by the river itself, for irrigation of the gardens and mulberry plantations. Much silk is produced in and around A.; also wine, cotton, corn, and madder. Silver, copper, and salt mines are wrought in the neighbourhood. Silk and salt are the chief articles of export. A. is the seat of an Armenian bishop. Pop. 25,000, of whom about 3000 are Armenians.

AMATRICÈ, a town of South Italy, in the province of Aquila or Abruzzo Ulteriore II, on the right bank of the Tronto, 21 miles north-by-west from Aquila. It was formerly a place of much greater importance than it is at present. It has five churches. The inhabitants are chiefly employed in agriculture and the manufacture of blankets. Pop. 2242.

AMBA'TO, or ASIEN TO D'AMBATO, a town of Ecuador, on the north-eastern slope of Chimborazo, 66 miles south from Quito, 8859 feet above the sea. It was destroyed in 1698 by an eruption of Cotopaxi, but was soon rebuilt, and became more flourishing than before. It carries on an active trade in grain, sugar, and cochineal, the products of the surrounding country. Pop. 12,000.

A'MBER, a decayed city in the Rajpoot state of Jeypoor, India, four miles north-by-east from Jeypoor, in $26^{\circ} 59'$ N. lat., and $75^{\circ} 58'$ E. long. It is situated on the margin of a small lake, in a deep hollow among hills; and its temples, houses, and streets are scattered among numerous ravines opening on the lake. Comparatively few of its houses are now inhabited; but everywhere are to be seen ghastly Hindu ascetics, sitting amidst the tombs and ruined houses. On the slope of an adjacent hill is the vast and gorgeous palace of Amber, a building remarkable for its massiveness and solidity.

AME'LIA (anc. *America*), a town of Central Italy, in the province of Perugia, 21 miles south-west of Spoleto. It is picturesquely situated on the mountains between the Nera and the Tiber, about seven miles from the junction of the two rivers. It is the seat of a bishop, and has a cathedral. Pop. of commune, 7024.

A'MIDES are a group of organic compounds, derived, under certain conditions, from ammonia (NH_3 , or NHHH), by the exchange of one or more atoms of hydrogen for a corresponding number of atoms of a metal, or a compound radical. The first of these compounds that was discovered was that in which one atom of hydrogen was replaced by one of potassium (NHHK , or NH_2K), the resulting product being regarded as a compound of NH_2 (*amidogen*) with potassium, and being termed amide of potassium. At present, the term *amide* is restricted to the case in which one or more atoms of hydrogen are replaced by an *acid* radical, and the amides are called primary, secondary, or tertiary, according as one, two, or all three of the atoms of hydrogen are replaced by the acid radical. The primary amides may be obtained in various ways, of which we shall mention two: (1.) If we heat an ammoniacal salt, two atoms of water are given off, and the amide corresponding to the acid is left; thus, acetate of ammonia ($\text{NH}_4\text{O}-\text{C}_2\text{H}_3\text{O}_2$) - water (H_2O) = acetamide $\{\text{C}_2\text{H}_5(\text{NH}_2)\text{O}_2\}$, which, expressed typically, is $\text{C}_2\text{H}_5\text{O}_2$ $\left\{ \begin{array}{l} \text{H} \\ \text{N} \\ \text{H} \end{array} \right.$, where $\text{C}_2\text{H}_5\text{O}_2$ is the radical of acetic acid. (2.) If an anhydride is submitted to the action of ammonia, there are simultaneously formed an amide and an ammoniacal salt. Thus, valerianic or valeric anhydride ($\text{C}_{10}\text{H}_{16}\text{O}_2$) + ammonia (NH_3) = valerate of ammonia ($\text{NH}_4\text{O}-\text{C}_{10}\text{H}_{15}\text{O}_2$) + valeramide

$\{C_{10}H_9(NH_2)O_2\}$, which, expressed typically, is $\left\{ \begin{matrix} C_{10}H_9O_2 \\ H \end{matrix} \right\} N$, where $C_{10}H_9O_2$ is the acid radical of

valeric acid. The amides are, for the most part, capable of being obtained in a crystalline form, and are fusible volatile bodies. For a description of the more complicated forms of amides, and for a history of their general properties, the reader is referred to the article 'Amides' in Watts's *Dictionary of Chemistry*, and to the chapter on Amides in the 2d edition (1867) of Naquet's *Principes de Chimie*, vol. ii. pp. 344—368. If, in place of an acid radical, a base radical replaces one or more atoms of hydrogen in ammonia, a class of compounds, termed amines, is formed, whose composition is noticed in the article ORGANIC BASES.

A'MLWCH, a town of Anglesey, North Wales, on the north coast of the island, 14 miles north-west from Beaumaris. It stands on a rising ground close to the sea, and consists of one principal street, with diverging streets and lanes. It is a busy but rather dirty town, deriving its importance and wealth almost entirely from the rich copper mines in its vicinity, the mines of the Parys Mountain. Copper-smelting is carried on in A., and contributes not a little to make the town unpleasant. A harbour has been formed by excavation out of the solid slate rock, at the expense of the mining companies, and is capable of receiving vessels of 600 tons burden. It is protected by a breakwater. A branch of the Chester and Holyhead Railway terminates at Amlwch. A. is associated with Beaumaris, Holyhead, and Llangefni, in returning one member to parliament. Pop. (1861) 3207.

AMOL, a town of Persia, in the province of Mazanderan, on the Heraz, a river which flows into the Caspian Sea; 76 miles north-east from Teheran. The town is unwall'd, but has good bazaars, and is a place of considerable prosperity and wealth. The river, which is powerful and rapid, is crossed by a bridge of twelve arches. Extensive ruins indicate the former importance of Amol. Its most notable building is the mausoleum of Seyed Quam-u-deen, king of Sari and Amol, who died in 1378. In the suburbs are a grand palace, which once belonged to Shah Abbas, and three towers, said to have been temples of the ancient Guebres, or fire-worshippers. The inhabitants of A. cultivate rice and cotton, or are employed in the iron forges and cannon-foundries of the district. The pop. in winter, when greatest, is estimated at 35,000 or 40,000; in summer, many of the inhabitants retire to summer residences in the mountains, which approach within about five or six miles of the town on the south.

AMPHIU'MA, a curious genus of *Batrachia*,

Amphiuma means.

having an eel-like form, a large head, thick and extensible lips, depressed and rounded snout; the

neck contracted, with a transverse fold at the throat; numerous small teeth on the maxillary and palate bones, a single spiracle on each side of the neck; four legs, all very small and two-toed. *A. means* is found in the southern and south-western parts of the United States. It attains a length of more than two feet, and is of a bluish-black colour. It lives in muddy water or in mud, burrowing like a worm in the ditches of rice-fields, and feeds on small fish, molluscs, and insects. It is regarded by the negroes as highly venomous, but there is no reason for the notion.

AMURNA'TH, a cave amidst the mountains which bound Cashmere on the north-east. It is a natural cave in a rock of gypsum, about 100 yards wide, 30 high, and 500 deep. It is believed by the Hindus to be the residence of the god Siva, and is therefore visited by multitudes of pilgrims. It is inhabited by vast numbers of doves, which fly out in alarm on the loud shouting of prayers by the pilgrims, and this is supposed to indicate the acceptance of their prayers.

AMY'GDALIN ($C_{20}H_{27}NO_{23}, 6HO$) is a crystalline principle existing in the kernel of bitter almonds, the leaves of the *Cerasus lauro-cerasus*, and various other plants, which, by distillation, yield hydrocyanic acid. It is obtained, by extraction with boiling alcohol, from the paste or cake of bitter almonds, which remains after the fixed oil has been separated by pressure. The alcoholic solution usually contains more or less oil, which must be removed by decantation or filtration; it must then be evaporated till a syrup is left, which must be diluted with water, mixed with yeast, and set aside to ferment, in order to get rid of any sugar that may be present: on now filtering and evaporating, the amygdalin crystallises in thin transparent needle-like prisms. It has a sweetish somewhat bitter taste, and is not poisonous, and when treated with alkaline solvents, ammonia is expelled, and amygdalic acid, $HO, C_{10}H_{23}O_{23}$, is produced. Its most remarkable change is, however, that which is noticed in the article ALMONDS, VOLATILE OIL OF, and which may be thus briefly stated. When the bruised almond kernel, or almond paste, is brought in contact with water, the peculiar odour of bitter almonds is almost immediately evolved; and in twenty-four hours, all traces of amygdalin will have disappeared, its place being taken by essential oil of almonds, hydrocyanic acid, sugar, and formic acid. This transformation is due to the presence of a peculiar nitrogenous matter called Emulsin (q. v.), or synaptase, which sets up a kind of fermentation. As the proportion of hydrocyanic acid which is liberated by the above reaction is fixed, Liebig and Wöhler recommend that amygdalin should be employed in preparing that acid for medicinal purposes. Amygdalin may be dissolved in water for any length of time without undergoing change; but if it be mixed with an emulsion of sweet almonds, immediate decomposition ensues. Seventeen grains of amygdalin, when dissolved in an ounce of emulsion of sweet almonds, furnish exactly one grain of pure hydrocyanic acid, which may be readily diluted to the strength of the Pharmacopœial acid.

A'MYL ($C_{10}H_{11}$) is the fifth in the series of alcohol radicals whose general formula is C_nH_{2n+1} , and of which methyl and ethyl are the first two members. It is obtained by heating amyl-iodide with an amalgam of zinc in a closed tube at a temperature of about 350°, and is one of the natural products of the distillation of coal. It is a colourless liquid, with a spec. grav. of 32°, a boiling-point of 311°, and a somewhat aromatic odour, and it exerts a right-handed rotatory action on a ray of polarised light.

It enters into a large number of chemical compounds, most of which—as, for instance, bromide, chloride, iodide, &c.—are derived from amylic alcohol, which bears precisely the same relation to amyl than ordinary alcohol bears to ethyl (C₂H₅). Amylic alcohol is sufficiently described in the article FUSK. OIL, which is the name given to the crude alcohol. It seems invariably to accompany ordinary alcohol when the latter is prepared by fermentation, and apparently occurs in largest quantity in those liquids which remain most alkaline during fermentation.

ANA'GNI (anc. *Anagnia*), a town of Central Italy, 37 miles east-south-east from Rome. It stands on a hill in the midst of a fertile district, and although an ill-built town, is the residence of many noble families. It is the seat of a bishop. There are some remains of ancient buildings. The ancient *Anagnia* was the chief city of the Hernici. It was a place of importance during the whole period of Roman history, and Virgil mentions it as the 'wealthy Anagnia.' Pop. 6000.

ANCA'STE, a town of the Argentine Republic, South America, in the province of Catamarca, 23 miles north-east from Catamarca. Pop. (1863) 8000.

ANDENNE, a town of Belgium, in the province of Namur, 10 miles east from Namur, and nearly 2 miles south from the Maas. It has manufactures of delft-ware, porcelain, and tobacco-pipes, for the last of which it is particularly famous. Cotton-spinning, bleaching, and other branches of industry are also prosecuted. There are beds of pipe-clay, quarries of marble, and lead, iron, and coal mines in the neighbourhood. Pop. 6458.

ANDERA'B, or INDERAB, a town of Bokhara, Independent Tartary, on the northern slope of the Hindu Kush Mountains, and on the right or northern bank of the Anderab or Inderab River, a branch of the Ghorri or Kunduz, itself a branch of the Jihun, 80 miles south-south-east from Kunduz. It is surrounded by gardens, orchards, and vineyards. It is a principal entrepôt of commerce between Persia and India. Pop. supposed to be about 6500.

ANDKHUY', a town, formerly of Bokhara, but now of Afghanistan, Central Asia, about 200 miles south of Bokhara, on a river flowing north towards the Jihun, but only part of which has as yet been traced. It lies on the high road to Herat, and is much exposed to the attacks of the Emirs of Bokhara and Afghanistan. Down to the year 1840, it is said to have been tolerably flourishing. It was then subject to Bokhara, and was compelled to oppose the victorious march of Mohammed Khan, who besieged it during four months, and at last only took it by storm. The city was plundered, and left a heap of ruins. The present sovereign, Gazanfer Khan, to preserve himself from utter destruction, threw himself into the arms of the Afghans. A. contains (1863) about 2000 houses, which form the city, and about 3000 tents, which are either in the environs, or scattered over the oases in the desert. The pop. is estimated at 15,000, consisting principally of Turkomans, with a mixture of Uzbeks and a few Tadjiks.—Vámbéry's *Travels in Central Asia*.

A'NDRIA, a city of South Italy, in the province of Bari, 31 miles west from the town of Bari. It stands on a plain, and in its vicinity are numerous caverns (*antra*), whence its name. Its cathedral, a fine edifice, was founded in 1046. During the wars of the Parthenopean Republic (q. v.), it was besieged by the republican army under General Broussier, and being taken after a gallant resistance, was burned, at the suggestion of Ettore Carafa, Count of Ruvo, himself its feudal lord. The neighbouring

country is famous for its almonds, which are a principal article of trade of the city. Pop. (1861) 30,067.

A'NDROS, an island of the Grecian Archipelago, the most northern of the Cyclades, separated from Eubœa by a channel, the Doro Channel, six miles broad. The island is 25 miles long, and about 10 miles in its greatest breadth. Its eastern coast is very irregular. It is very mountainous, and on some of its mountains snow lies during great part of the year. The soil is very fertile, and wine, silk, wheat, barley, lemons, oranges, and pomegranates are produced. Silk is the chief article of export. The pop. is supposed to be about 15,000. The chief town, ANDROS, is situated on a bay of the eastern coast. It has manufactures of silk and carpets, and a large port, which, however, is suitable only for small vessels. Pop. 5000.

ANDU'JAR, a town of Andalusia, Spain, in the province of Jaen, 24 miles north-north-west from Jaen, on the right bank of the Guadalquivir, at the base of the Sierra Morena. Its streets are irregular, but many of the houses are well built. The river is crossed by an old dilapidated bridge. The situation of the town is unhealthy. The inhabitants are mostly employed in agriculture; but there is some trade in grain, fruit, oil, and cattle, the produce of the neighbouring country, and the town is famous for the manufacture of the porous cooling clay water-vessels which are in general use throughout Spain. The Convention of Baylen was signed here on 23d July 1808. Pop. 9353.

ANGEIOLEUCITIS. See ADENITIS.

ANGHIA'RI (anc. *Castrum Angulare*), a town of North Italy, in the province of Arezzo, Tuscany, 10 miles north-east from Arezzo, on the slope of a hill near the Sovara, one of the head-waters of the Tiber. In 1440, a battle was fought here, in which the Milanese were defeated by the Florentines. Pop. of commune, 6941.

ANGORNOW', or NGO'RUNU, a town of Bornu, Central Africa, on the south-western bank of Lake Tchad, 15 miles south-east from Kukawa. The surrounding country is very level and monotonous, but fertile. The waters of Lake Tchad are usually some miles distant from the town, yet the whole intervening plain is sometimes covered with water, and the town itself is liable to destructive inundations. It is a place of considerable commercial importance; the principal articles of trade are slaves, cotton, amber, coral, and metals. The pop. is supposed to be about 30,000.

A'NGRA, the capital of the Azores, beautifully situated on the south coast of the island of Terceira. Its harbour is the best in the island, but is exposed to violent storms during certain months of the year. The principal exports are wine and grain. The town is strongly fortified. It is the seat of the Bishop of the Azores, and has a cathedral. The streets are broad, and have footpaths, and the houses are mostly of three stories. Pop. about 13,000.

A'NGRI, a town of South Italy, in the province of Salerno, and 17 miles north-west from Salerno, not far from the Naples and Nocera Railway. The surrounding country abounds in vineyards and cotton plantations. Pop. 6921.

ANHYDRIDES is the term now commonly given to the compounds formerly known as anhydrous acids, which was a very unsatisfactory name, seeing that these bodies do not present any of the ordinary properties of acids. In some cases, they are the result of the dehydration of acids, and in all cases they represent in their composition the acid *minus*

water. One of the most eminent French chemists, Professor Wurtz, lays down the following general principles: '(1) The anhydrides of monobasic acids (a) contain the elements of two molecules of a monobasic acid, *minus* one molecule (which corresponds with two atoms) of water; (2) the anhydrides of dibasic acids (b) contain the elements of a molecule of a dibasic acid, *minus* a molecule of water; (3), the anhydrides of tribasic acids (c) contain the elements of a tribasic acid, *minus* water.' Thus, using the modern formulæ and the type theory, we give a case of each form of acid:

The reader who may not at once be able to interpret these formulæ, will readily see that $\left(\begin{array}{c} \text{NO}_4 \\ \text{H} \end{array} \right) \text{O}_2 = \text{NO}_2\text{HO}$, the old formula for nitric acid, that $\begin{array}{c} \text{S}_2\text{O}_4 \\ \text{H}_2 \end{array} \text{O}_4 = 2(\text{SO}_2\text{HO})$, the old formula for sulphuric acid, which is now universally placed amongst the dibasic acids; and that $\left(\begin{array}{c} \text{PO}_3 \\ \text{H}_2 \end{array} \right) \text{O}_6 = \text{PO}_3\text{.}3\text{HO}$, the old formula for tribasic phosphoric acid. According to the old system, the three anhydrides would be represented by NO_2 , SO_2 , and PO_3 respectively. We might have taken organic acids, as, for example, acetic acid, succinic acid, in place of nitric and sulphuric.

The anhydrides of the monobasic acids are formed in various ways; thus, hypochlorous anhydride is formed by the action of chlorine on oxide of mercury; nitric anhydride is formed by the action of chlorine on nitrate of silver, &c. By the action of ammonia, the anhydrides of monobasic acids are converted into amides; thus, benzoic anhydride ($\text{C}_6\text{H}_5\text{O}_2$) + ammonia (NH_3) = benzamide ($\text{C}_6\text{H}_5\text{NO}_2$) + water (HO). The anhydrides of tribasic acids are often formed by the mere action of heat on the acids, as is the case with lactic and tartaric acids.

The anhydrides present no uniformity of appearance; for example, carbonic anhydride (commonly known as carbonic acid, which in reality is CO_2HO) is a gas; phosphoric anhydride is a white powder; nitric anhydride occurs in crystals; sulphuric anhydride is a ductile wax-like substance; while the anhydrides of the organic acids are oily bodies heavier than water.

The most important property of this class is their conversion into the corresponding acids, under the influence of water.

ANILINE is now universally regarded as, in a technological point of view, one of the most important organic compounds yet discovered (see DYE-STUFFS). Its chief physical and chemical characters are described under the head of *Phenyl* (q. v.), an organic radical, represented by C_6H_5 , which, if aniline is (as Hofmann believes) a derivation of ammonia, replaces one of the atoms of hydrogen, yielding $\begin{array}{c} \text{C}_6\text{H}_5 \\ \text{H} \end{array} \text{N}$, or $\text{C}_6\text{H}_7\text{N}$, which is the

formula for this compound. There is one salt of aniline which requires notice, because its therapeutic value has been highly praised—viz., the sulphate of aniline, which is prepared by saturating a certain amount of aniline with dilute sulphuric acid,

evaporating to dryness, and extracting the residue with boiling alcohol, which, on cooling, leaves white silvery scales of sulphate of aniline. To obtain the salt quite pure, it may be dissolved and separated a second time, after which it must be preserved in well-stoppered bottles. The importance which the aniline manufacture as a dye-stuff has acquired during the last few years has led to the study of its physiological, therapeutical, and toxicological properties, and hence to the hygienic precautions which should be adopted in the chemical works devoted to its preparation, as well as to the influences which the aniline colours may exert on those who employ them in dress, &c.

The *physiological* action of aniline has been recently studied by nearly a dozen independent observers, and the following are the principal results at which they have arrived: (a) When administered internally in a moderate dose, this substance causes a considerable muscular excitement, lasting for some minutes, and then gradually disappearing. When given in a *poisonous* dose, it causes an immediate flow of viscid saliva, from which the animal tries to free itself by rubbing its mouth on the ground; in about ten minutes it becomes quiet and dull, and coldness supervenes, which continues and increases till death. The other most apparent symptoms are convulsive spasms, which first affect the hind legs, but soon extend to the anterior extremities. The eyelids are widely separated, while the pupils are somewhat contracted; and the tumultuous beating of the heart and the hurried respiratory movements shew that the convulsive state of the other muscles has extended to those which regulate the most important vital functions. From ten to fifteen drops of aniline will thus prove fatal to a rabbit or to a dog of medium size. In still larger doses the poison causes the animal's head to be convulsively drawn backwards, and death rapidly ensues. On examination after death, an odour of aniline is found to be given off by the blood, whose globules, when microscopically examined, are found to be partially disintegrated and deprived of their red pigment. (b) Its effects on animals, as well as those of nitro-benzene, from which it is produced, when *inhaled* is a *state of vapour*, have been carefully studied by M. Bergerow, whose experiments were so arranged as to imitate the conditions to which workmen are exposed in the aniline manufactories. As might be expected, the effects of aniline are slower and less marked than when the substance is introduced into the stomach, but are of the same character—the spinal cord and muscular system being more or less *excited*; while the vapour of nitro-benzene, which seems to act primarily on the brain, causes stupor. On the whole, the experiments tended to shew that aniline, notwithstanding the terrible spasmodic symptoms which it excites, is less serious in its consequences and more transient in its action than nitro-benzene. The phenomena observed in experiments on animals closely correspond with those which have been observed in cases in which man has been exposed to the noxious vapour. The following case recorded by Mr Knaggs seems well to illustrate the effects of inhaling a large dose of aniline vapour: A workman broke a carboy containing a large quantity of this liquid, which fell over him without entering his mouth. In trying to wipe up the aniline, he respired the vapour for some time, felt giddy, and complained of his head and chest. When seen some hours afterwards, his face and body were of a livid leaden blue; the lips, gums, tongue, and eyes of a corpse-like bluish pallor; he was breathing by gasping, and appeared at the point of death. There was then no convulsion, and he was quite sensible. His pulse was small and irregular.

Under very energetic treatment (alcohol, ammonia, chloric ether, internally, and cold affusions and sinapisms externally), he recovered. According to Dr Lethesby, who has reported a similar case, the aniline undergoes changes in the blood similar to those which it undergoes in the formation of the dye-stuffs; and the mauve, magenta, &c., that are thus formed in the circulation, occasion the blue or violet colour which the gums and mucous membrane of the mouth present in these cases.

The symptoms observed in the various experiments on animals led several physicians to try its therapeutic action in diseases of the nervous system. Sulphate of aniline was the form selected, and chorea the disease on which it was especially tried, although it has also been administered in epilepsy and other nervous diseases. The results are contradictory; and till further evidence of its value is adduced, it is not likely to supplant other medicines of the same class.

The workmen employed in the fabrication of nitro-benzine and aniline (for the two are prepared in the same works) suffer, for the first day or two after commencing this occupation, from severe supra-orbital headache, frequently accompanied with nausea and vomiting. While some persons suffer so severely that they are compelled to seek another employment, most, after a fortnight's experience, cease to feel the ill effects, except accidentally, as after extra work or intense heat. Till they become seasoned, most suffer from vertigo, which rapidly disappears on exposure to a current of fresh air; and sometimes the vertigo is succeeded by loss of consciousness. Sometimes the face becomes congested, the patient staggers and falls to the ground in a semi-comatose state like a drunken man; in the course of an hour or two he wakes up, suffering only a feeling of fatigue. In other cases, regular epileptiform convulsions of the limbs and tetanic spasms of the neck are observed, the patient often remaining in this state for an hour or more before recovery. Such may be regarded as the acute symptoms exhibited by new hands. Those who have become seasoned, complain of great general languor, a partial loss of sensation in the upper extremities, and constipation of the bowels; and they almost always present a decolorisation of the skin and mucous membranes, in consequence of the impoverished state of their blood, which is said to be rapidly restored by making the patient inhale oxygen gas or compressed air. In reference to the influence of the aniline colours on the health of those who use them, it may be remarked, that even if they were poisonous, they adhere so tenaciously to the stuffs that are dyed with them, that there is no fear of the detachment of a noxious powder, as in the case of the arsenical greens. But fortunately they seem perfectly harmless even when taken internally, according to Sonnenkelb, provided they are completely freed from the arsenic, lead, mercury, or other poisonous metal that has been employed in the oxidation of the aniline. Hence, when they are quite pure, fuchsine and the allied pigments may be safely employed in colouring sweetmeats, liqueurs, confectionery, ices, &c., which it is very satisfactory to know, seem how largely they are at the present day employed.

ANKLAM, or ANCLAM, a town of Prussia, in the province of Pomerania, 44 miles north-west from Stettin, on the right bank of the Peene, and 4 miles from its mouth in the Kleine Haff. The river is navigable to A., which carries on a considerable commerce, and has long been a place of commercial importance, having been admitted into the Hanseatic League in 1319. It has manufactures of linens and woollens; it has also several breweries, soap-works,

and tanneries, and ship-building is actively prosecuted. During the middle ages, A. suffered more than almost any other town from fire and pestilence; and in the wars of the 17th and 18th centuries, it was again and again besieged and sacked. On the close of the Seven Years' War, in 1762, its fortifications were happily dismantled. It is still, however, surrounded by an old wall with three gates. It contains many interesting specimens of the Hanseatic or North German architecture, very like the Flemish. Pop. 12,133.

ANNABERG, a town of the kingdom of Saxony, in the district of Zwickau, on the right bank of the Sehm, 18 miles south from Chemnitz. It is situated 1800 feet above the level of the sea, in a mining district; the surrounding hills containing mines of silver, tin, cobalt, and iron. It has extensive manufactures of lace and of silk ribbons. The ribbon manufacture was introduced here by Protestant refugees from Belgium, who fled from the persecution carried on by the Duke of Alva. Pop. (1864) 10,537.

ANNECY, a town of the dep. of Haute Savoie, France, at the north-western extremity of the Lake of Annecy, and 21 miles south from Geneva. The Lake of Annecy is 1426 feet above the sea, and is surrounded by magnificent mountain scenery. It is about 9 miles long and 2 miles broad. Its waters flow by the Ficanr to the Rhone. In the 12th c. A. was called *Anneciacum novum*, to distinguish it from Old A., *Anneciacum vetus*, which occupied the slopes of a neighbouring hill, and was a place of some consequence in the times of the Romans. In the earlier part of the middle ages, A. belonged to the Counts of Geneva, and on the extinction of that House, it passed to the House of Savoy, in whose possession it remained, except for a brief period under the French Empire, until the transference of Savoy to France in 1860. It has manufactures of linens, cotton-yarn, glass, sulphuric acid, and steel-ware. Its linen bleachfields have subsisted since 1650. The town is clean, and has an air of respectable antiquity. The shops in many of the streets are under arcades. The most remarkable buildings are the chateau, once the residence of the family of Genevois-Nemours, the old bishop's palace, the cathedral, and the modern church of St Francis, the latter of which boasts of possessing the relics of St Francis of Sales and La Mère Chantal. Pop. (1866) 9305.

ANNONAY (anc. *Annoneum* or *Annoniacum*), a town of the dep. of Ardèche, France, at the junction of the Deaume with the Cance, which unite in the centre of the town, 37 miles south from Lyon. It is an active and prosperous manufacturing town, the chief manufacture being that of paper, of which 300,000 reams are produced annually. There are also manufactures of glove-leather, mostly from kid skins, and of silk and cotton twist, and woollen cloth. The paper-mills of A. were established by the father of the celebrated aeronauts, Montgolfier (q. v.), who were born here, and to whom there is a monument in the Grande Place. The situation of the town is picturesque and remarkable; the houses are placed among rocks, and some of the streets are very steep. A large quantity of silk is produced in the neighbourhood. Pop. (1866) 15,697.

ANSPACH, or, more properly, ANSBACH, a town of Bavaria, the capital of the circle of Middle Franconia (*Mittel-Franken*), on the Rezat, 25 miles south-west from Nürnberg. It has manufactures of cotton and half-silken fabrics, tobacco, earthenware, playing-cards, cutlery, and white lead; also a considerable trade in wool, flax, and corn. The situation is pleasant, but there are no remarkable buildings,

except the deserted palace of the former margraves of A., surrounded by gardens, and the church of St Gunibert, said to occupy the site of a church erected in the 8th c., around which the town grew. The margraves of A. were a branch of the family of Hohenzollern. The last of them sold his possessions in 1791 to Prussia; and in 1806, Napoleon I. transferred A. to Bavaria. Pop. (1864) 12,973.

ANTA'CIDS are medicines which correct abnormal acidity of the stomach and intestinal canal by directly combining with the free acid that may be present. Their action is obviously merely temporary, as, unless combined with other medicines, they do not correct the morbid condition which causes the undue acidity; and their too prolonged use must be carefully avoided, since, at all events, some of these medicines, as the alkalies and their carbonates, are liable to induce a state of general anæmia, morbid deposits in the urine, and a series of symptoms not unlike those of scurvy. Antacids are best given in association with vegetable tonics; and for the reasons already stated, their administration must be carefully watched, and should be occasionally omitted. Dr Neligan makes the following excellent remarks on the particular remedy to be employed for special forms of acidity: 'When the acid exists in the stomach in the gaseous state, ammonia or its carbonates should be preferred, as, in consequence of their volatility, a gaseous acid which would elude the action of the fixed alkalies, may be neutralised by them. If the acidity be present in the lower bowel, as in the cæcum or colon, magnesia or lime ought to be administered, as being less likely than the other antacids to be neutralised or absorbed before it reaches that portion of the intestinal canal. When the acid exists in the urinary organs, the alkalies will be found best adapted, as they have a tendency to act more directly on the kidneys; and when it is *lithic* (or *uric*) acid which preponderates in the urine, the preparations of lithia or potash should be preferred to those of soda, as the salts formed by the two former with the acid in question are much more soluble than those formed with the latter. In persons of a corpulent habit of body, potash is to be preferred to ammonia or soda when the use of an alkali is indicated. And finally, ammonia and its preparations are best adapted for the old and debilitated, as also for those of enfeebled constitution.' The antacids include solutions of ammonia, lime (commonly known as lime-water), potash, and soda, various carbonates of these substances, magnesia and its carbonates, and the carbonate and citrate of lithia.

Many of the medicines of this class possess other properties besides that of neutralising free acids; but a notice of such properties does not fall within the scope of the present article.

ANTISPASMO'DICS. See **SPASM.**

ANUPSHUHUR, a town of India, in the British district of Bolundshuhur, North-west Provinces, on the right bank of the Ganges, 73 miles east from Delhi, on the route to Bareilly. The channel of the Ganges is here about a mile wide, but only about one-fifth of that space is occupied by the stream in the dry season. The town is ill built and crowded, the houses either of mud or ill-cemented brick. Pop. 8947.

A'NUS, THE, AND ITS DISEASES. The term *anus* is applied by anatomists to the lower or (in the case of animals) the posterior aperture of the intestinal canal; the rectum terminating externally in the anus. With regard to its anatomy, it is sufficient to state that it is kept firmly closed on ordinary occasions by the *external and internal sphincter*

muscles, the former of which contracts the integument around the opening, and, by its attachment to the coccyx behind, and to a tendinous centre in front, helps the *levator ani* muscle in supporting the aperture during the expulsive efforts that are made in the passage of the *feces* or intestinal evacuations; while the latter or *internal sphincter*, is an aggregation of the circular muscular fibres of the lowest part of the rectum, and acts in contracting the extremity of the tube. The main function of the *levator ani* muscle is expressed in its name, it being the antagonist of the diaphragm and other muscles which act in the expulsion of the *feces*. The integument around the anus lies in radiating plaits, which allow of its stretching without pain during the passage of the *feces*; and the margin is provided with a number of sebaceous glands, which, in some of the lower animals, secrete strongly odorous matters. See **ANAL GLANDS.** Infants are occasionally born with an imperforate *anus*, or congenital closure of the rectum. In the simplest form of this affection, the anus is merely closed by thin skin, which soon becomes distended with the Meconium (q. v.). More complicated cases are those (1) in which the gut terminates some distance above the seat of the anus in a blind sac or pouch; (2) where the rectum terminates in the bladder, &c. Fortunately, the closure by a layer of skin is far the most common form of imperforate anus, and the little patient is at once relieved by a very simple surgical operation. If, however, no treatment be adopted, which is too often the case, in consequence of a popular delusion that the affection is incurable, the abdomen becomes distended and hard, vomiting comes on, the vomited matters soon assume a fecal smell, and the infant dies in a few days, either from exhaustion or rupture of the intestines.

Spasm of the Sphincter Ani is by no means a rare affection; it is characterised by violent pain of the anus, with difficulty in passing the *feces*. On attempting an examination, the muscle feels hard, and resists the introduction of the finger. It usually occurs in sudden paroxysms, which soon go off; but sometimes it is of a more persistent character. Its causes are not clearly known, and although most surgeons regard it as a special affection, some consider that the spasm is not a disease in itself, but merely a symptom of some slight excoriation or ulceration. Suppositories containing opium or belladonna introduced during the period of relaxation, are sometimes of use; and if there are ulcers, they must be specially treated. *Ulceration* occurring as a breach of surface at one or more points around the anus, but not extending within the orifice, is by no means uncommon in persons who are not attentive to cleanliness, and especially in women with vaginal discharges. Strict attention to cleanliness, the patient being directed to apply warm water to the parts at least twice daily with a sponge (which after each operation should be carefully rinsed out), and one or two applications of the solid nitrate of silver, followed by black-wash, will effect a speedy cure. If the ulcer is seated partly *without* the anus and partly *within* the rectum, the distress is much more severe, and the treatment often requires the use of the knife. *Fissure of the anus* is a term applied to an affection consisting in one or more cracks, excoriations, or superficial ulcerations, situated between the folds of the skin and mucous membrane at the verge of the anus, and only slightly involving the rectum. They give rise to intense pain during the passage of the evacuations, and for some hours afterwards to great discomfort, smarting, and itching. The treatment to be adopted is to endeavour to procure regular and somewhat soft evacuations, and to sponge with warm water

immediately afterwards, the parts being dried with a soft cloth. One or two applications of solid nitrate of silver will sometimes cure the disease; and an ointment of oxide of zinc, or one containing chloroform, will sometimes serve to allay the irritation and heal the parts.—*Pruritus ani*, which simply means intense itching and irritation of this part, is perhaps rather to be regarded as a symptom of certain morbid changes rather than as a special disorder; but as it is a very common affection, and is productive of much suffering, it must not be passed over. It is often associated with an unhealthy state of the intestinal secretions, or with simple constipation; with a congested state of the mucous membrane; with a disordered condition of the womb; with the presence of thread-worms in the rectum, &c.; and it is peculiarly common in persons whose occupations are sedentary. The affection is often much aggravated by the patient's being unable to refrain from scratching the parts, which leads to excoriations, ulcerations, thickening of the skin, &c. The symptoms are usually most severe when the sufferer begins to get warm in bed. If the affection arise from worms, or a loaded state of the large intestines, enemas and purgatives will give immediate relief. If unhealthy excretions exist, attention must be paid to the diet, and the occasional administration of a pill containing a grain of calomel and four grains of watery extract of aloes, together with the local application of soap and water to the parts, will often stop the itching. If there are any cracks or ulcers, nitrate of silver must be applied until they heal. To prevent the reappearance of these sores, the patient should bathe the parts night and morning with a strong solution of alum. An ointment composed of a drachm of calomel and an ounce of lard is strongly recommended by Mr Smith of King's College Hospital, when other means have failed; who also states that the daily introduction of a well-oiled bougie, made of black wax, will sometimes succeed in very obstinate cases. The other principal affections of the anus are *Fistula*, *Piles*, and *Prolapsus*, which are discussed in special articles.

AONLAGANJ, or **AOUNLAH**, a town of India, in the British district of Bareilly, 21 miles south-west from Bareilly, on the route to Allygurh. It has a large bazaar. Pop. 7649.

APATHIN, a town of Hungary, in the county of Bacs, near the left bank of the Danube, 49 miles south-west from Theresiopol. It has manufactures of woollen cloth, and a considerable trade in hemp, silk, madder, and woad, the products of the vicinity. Pop. 9053.

APELDORN, a beautiful village in the Netherlands province of Gelderland, is situated about 17 miles north from Arnhem, on a canal which joins the river Grift, a branch of the Yssel, by which, and the public roads from Arnhem and Utrecht to Deventer and Zutphen, it has much traffic. The Loo, a hunting-lodge of the king, is in the neighbourhood. Besides agriculture, making paper, grinding corn, founding copper, manufacturing blankets and coarse woollen cloth, &c., are the principal industries. Pop. of A. and adjoining hamlets (1865), 12,087.

APHA'SIA (Gr. *a*, not, and *phasis*, speech) is a term adopted by the eminent French physician, Trousseau, to denote a remarkable symptom of certain conditions of the nervous system in which the patient is more or less unable to express his thoughts in speech. The disease has been casually noticed by many earlier observers, amongst whom Dr Parry of Bath may be especially noticed; but it was not until within the last five or six years that it has received the attention which its great singularity

demands. Before receiving its present name, it had been termed *Aphemia* (from *a*, not, and *phemi*, I speak), and *Alalia* (from *alaleo*, I talk). Voisin, in an elaborate Memoir on this subject, published in 1865, observes that it may be due to several causes. It may be congenital or acquired, and in the latter case is due to some form of lesion or injury of the anterior lobes of the brain. This fact was observed as long ago as 1825 by Bouillaud; but in 1861, during a discussion of the Anthropological Society of Paris, as to whether certain faculties, such as language, are or are not localised in special parts of the brain, Broca advanced the view, that the faculty of language has its seat not only in the anterior lobes, but in the left lobe, and occupies exactly the external left frontal convolution, where the anterior lobe meets the middle lobe immediately in front of the fissure of Sylvius. This singular conclusion was deduced from only two post-mortem examinations which had just occurred at the Bicêtre, but a number of previously published cases supported it; and Dr Hughlings Jackson, of the London Hospital, 'has seen about seventy cases of loss or defect of speech with hemiplegia, and in all but one, the hemiplegia was on the right side, indicating disease of the left side of the brain.'—*Lancet*, November 26, 1864. Moreover, in the two cases which during the last year proved fatal in the Edinburgh and Glasgow Infirmary, Dr Sanders and Dr Gairdner traced the disease to the exact spot described by Broca. It may be caused by wounds, tumours of various kinds, including hydatids, or by softening of the left anterior lobe, and has occasionally, but very rarely, been found in association with lesions of other parts of the cerebrum, and even of the cerebellum and spinal cord. According to Voisin, in 146 cases, the left anterior lobe was affected in 140, and the right in only 6 cases. A variety of aphasia has been noticed in typhoid fever and in the first stage of small-pox; also in certain chronic cachexias or intoxications, as, for example, in syphilis and chronic alcoholism; and there are cases in which the affection is purely nervous, and results from epilepsy, an over-taxed brain, &c. The patients in whom true aphasia from disease of the brain occurs, are excellently described by Dr Gairdner in his essay *On the Functions of Articulate Speech*, &c. (Glasgow, 1866). This description, in a condensed form, is as follows: These patients have been the subject of some form of disturbance of the cerebral functions, sometimes with, but sometimes also without a manifest disturbance of the intellect. It may have been epilepsy or apoplexy, in which latter case, as has been already noticed, there is often paralysis, almost invariably on the right side of the body. This paralysis may be of any extent of completeness, but in many cases the patient has such command over the movements of the tongue and lips, as to shew that it is not from paralysis his speech is affected. The states of intellect and consciousness are equally variable, the patient occasionally appearing and behaving as if he were in perfect bodily and mental health, except for the aphasia. Moreover, the aphasia itself shews itself in the most varied forms. In the more trivial cases, it is little more than an aggravation of the common defect of forgetting, or being unable to recall the name of a person or thing when wanted. Dr Gairdner records the case of what he calls 'an aphasic,' who could conduct an ordinary conversation pretty well, but who could not name the days of the week, and would, for instance, call Monday 'the first working-day,' and who had forgotten, or could not give utterance to his own name. Sometimes a patient will perfectly articulate such expressions as these: 'I want —, I want — Where's the' —, almost always stopping short at the name

of the object. Sometimes the patient's vocabulary is limited to one or two common words, as 'Yes' or 'No,' or perhaps he utters only one or more unintelligible words, as in the case of one of Trousseau's patients, who for four months uttered nothing but 'Cousin' to every possible question, unless when in moments of great irritation, and he would then articulate 'Sacon, sacon'—probably an abbreviation for a French oath. Strange to say, certain aphasics who can articulate absolutely nothing else, can swear with perfect facility. Such exclamations as 'Oh!' 'Dear me!' 'God bless my life!' and 'D—n it!' are often the only utterances of these patients. Dr H. Jackson, in a Memoir on Aphasia, in the first volume of the *London Hospital Reports*, has made some excellent remarks on this peculiarity, which are well worthy of perusal by all who study mental philosophy. He ingeniously regards an oath not as a part of language, but as 'a sort of detonating comma.' The general reader may also read with advantage the histories of two cases recorded by Trousseau, in which Frenchmen of high mental capacity, and well acquainted with the disease (one of them an eminent physician in Paris, who had specially studied the diseases of the brain; and the other, Professor Lordat of Montpellier), have passed through attacks of aphasia, have recovered, and have described their own cases.

Aphasia may be either temporary or persistent; in the former case, being due to loss of nervous energy, congestion, or some other functional disorder; while in the latter case, it is probably associated with disease of structure. It is unnecessary to describe the treatment, which varies according to the peculiarity of each individual case, and must be left solely in the hands of the physician.

APHONIA (Gr. *a*, not, and *phōnē*, voice) is the term used in Medicine to signify a more or less complete loss of voice. It is altogether distinct from mutism, in which it is impossible to form articulate sounds, and in most cases the voice is not entirely gone, but only more or less lost or suppressed. The voice is essentially produced (as has been proved in the special article on that subject) by three distinct agents—viz, (1) the expiration of air, (2) the opening of the glottis, and (3) the tension of the vocal cords—and hence anything interfering with expiration, or with the functions of the glottis and vocal cords, may cause aphonia. Thus, it may result from paralysis of the respiratory muscles, from pulmonary emphysema, and sometimes from pneumonia; or it may be caused by diseases of the larynx, as chronic laryngitis, œdema of the glottis, polypus, &c.; or by pressure on the larynx caused by abscesses, vegetations, and any kind of morbid growth; or it may be traced to some functional or organic disturbance of the inferior vocal cords. Thus, the muscular fibres which act on these cords may become affected in acute laryngitis by extension of the inflammation, or their action may be impeded by the pressure of false membrane in croup. In typhoid fever, the aphonia which is so commonly observed is due to ulceration extending to these structures. Again, in cases of lead or phosphorus poisoning, there is aphonia due to fatty degeneration of these muscles. Not unfrequently, aphonia may be traced to compression of the recurrent or inferior laryngeal nerve, which is the nerve supplying motor power to all the muscles of the larynx, with one trifling exception.

Such pressure is not unfrequently caused by an aneurism, an abscess, tumour, &c. In the same way, a wound or contusion of the pneumogastric nerve, or one of the recurrent branches, will cause aphonia, or, more commonly, an extremely hoarse modification of the voice, in consequence of the laryngeal

muscles being paralysed on one-side, and remaining active on the other. There are cases of direct nervous action being interfered with; but there are many cases of what may be termed *reflex aphonia*, as when the voice is often more or less lost in the course of pregnancy when accompanied with convulsions, or in consequence of the presence of intestinal worms, or after the rapid suppression of an exanthematous rash, or of a long-continued hemorrhagic discharge. Aphonia is, moreover, very commonly associated with hysteria.

When aphonia is not due to irremovable causes, as tumours pressing on the recurrent nerve, fatty degeneration of the laryngeal muscles, &c., it generally disappears after a longer or shorter interval. It occasionally assumes remarkable intermittent shapes. In one instance, the affection came on regularly at the same time of the year for seventeen years, beginning daily at noon, and lasting the remainder of the day, for a period varying from three to seven months. Another case is recorded in which, during fourteen years, a young woman could only speak during two or three hours daily.

In those cases which are amenable to treatment, emetics, electricity, strychnine, leeching, blistering, croton-oil liniment, and internal application of nitrate of silver, have been found to be the most useful remedies.

APOLODA, a town of the grand duchy of Saxe-Weimar-Eisenach, Germany, on the Werlitz, a feeder of the Saale, eight miles north-east from Weimar. It is a station on the Thuringian Railway, between Weimar and Weissenfels. It is a place of much industrial activity, having extensive manufactures of hosiery. Pop. (1864) 8731.

ARABGIR, or **ARABKIR** (anc. *Anabrace*), a town of Asiatic Turkey, in the pashalic of Sivas, in a mountainous and rocky district, not far from the Euphrates, and 150 miles south-south-west from Trebizond. It contains a pop. of about 30,000, nearly one-fourth being Armenians, the other three-fourths Turks. It is to the enterprise and industry of the Armenians that the town owes its prosperity. It is specially noted for the manufacture of goods from English cotton yarn. The neighbouring country is inhabited by Turcomans.

ARAGONA, a town of Sicily, 8 miles north-north-east from Girgenti. It is a poor town, and stands in the midst of bare green downs; but the hills above it are clothed with pines, cypresses, olives, almonds, and carobs. The only object of interest is the old castle of the princes of Aragona, a huge building, in the Renaissance style, which has fallen much into decay. Pop. 7947.

ARAVULLI, a range of mountains in Western India, extending from about 22° 40' N. lat., 74° E. long., to 26° 50' N. lat., 75° E. long. The highest summit is Abu (q. v.). The north-eastern extremity of the range sinks into comparatively low rocky hills. The north-western side is very bold and precipitous, the south-eastern less so. There is no road practicable for wheel-carriages across this range for a distance of 220 miles.

ARCE (anc. *Arx*), a town of South Italy, in the province of Caserta, 60 miles east-south-east from Rome. It is situated on a hill near the Liris; and the summit of the hill, which is lofty and precipitous, is crowned by an interesting mediæval fortress called *Rocca d'Arce*. This fortress was considered impregnable till it was scaled and taken by the invading army of Charles of Anjou in 1266. Numerous inscriptions in which the name of Cicero occurs have been discovered near A.; and some

ruins near the town are known as *L'aja di Cicerone*, or Cicero's Barn. Pop. of commune, 5467.

ARCIDOSSO, a town of Central Italy, in the province of Grosseto, 23 miles north-east from Grosseto, on a feeder of the Umbrone, among the Apennines. Pop. of commune, 5859.

ARCUS SENILIS, a not very well chosen term for a change occurring in the cornea of the eye, in consequence of fatty degeneration of its marginal part. The term is objectionable, because the change usually commences before the advent of old age, and further, because the *arcus*, or arch, is usually converted into a complete circle by the time that the patient has reached the age of sixty or seventy years. The *arcus senilis* usually commences at or even before the age of forty years, as an opaque whitish crescent, skirting either the upper or lower margin of the cornea; and from this commencement it extends along the edge, till it finally becomes a complete circle, which sometimes assumes a chalky whiteness, and gives to the eye a very peculiar appearance. On careful examination, it may be seen that a narrow interval of partially clear cornea always intervenes between the arcus and the opaque sclerotic. As far as the eye is concerned, the formation of this circle is of little importance, but it is of great diagnostic value to the physician if, as Mr Canton and several late observers maintain, its presence indicates the coexistence of fatty degeneration of the heart.

ARDOYE, a town of Belgium, in the province of West Flanders, 17 miles south from Bruges. Linen-bleaching is the principal branch of industry. Brewing and candle-making are also carried on. Pop. (including the commune, which is not large) 6478.

ARECIBO, a town of Puerto Rico, Spanish West Indies, on the north coast of the island. It is the chief town of a province of the same name. It has a considerable trade, and a railway has been proposed to connect it with San Juan. Pop. 11,187.

ARGENTA, a town of Central Italy, in the province of Ferrara, and 18 miles south-east from Ferrara, on the Reno, in the plain near the Marshes of Comacchio. Pop. (1861) of commune, 15,926.

ARL'NO (*Arianum*), a city of South Italy, in the province of Principato Ulteriore, beautifully situated on a steep hill of tertiary limestone, at the height of 2900 feet above the sea, in one of the most frequented passes of the Apennines, on the main road from Naples to Puglia, 50 miles north-east from Naples. It is a bishop's seat, and has a fine cathedral. The chief manufacture is earthenware. There is a considerable export trade in wine and in butter. A. is said to have been founded by Diomed. Roger II. held a parliament here to settle the affairs of the province, after his defeat of the allied armies of Pope Innocent II. and the Prince of Capua. In the southern face of the hill on which the city is built, hundreds of caves have been dug, which are the habitations of many of the poorer inhabitants. Pop. 12,588.

ARLON (anc. *Orolanum*), a town of Belgium, the capital of the province of Luxembourg, 24 miles west-north-west from Luxemburg. It is a station on the railway between Namur and Luxemburg. It is a neat and prosperous town, and has a considerable trade in corn, woollen stuffs, leather, iron, &c. It has frequently suffered the ravages of war. The French pillaged it in 1793, after a victory won in its neighbourhood over the Austrians. Pop. (1861) 5647.

ARMENTIÈRES, a town of the dep. of Nord, France, on the Lys, near the Belgian frontier, eight

miles north-west from Lille. It is a station on the railway between Hazebrouck and Lille. The town is well built, and is active and prosperous, having manufactures of cotton, linen, lace, thread, sailcloth, beet-root sugar, and soap, and a considerable trade in grain and bricks. Large quantities of bricks are made in the neighbourhood, and are exported by boats on the Lys. Pop. (1866) 13,901.

ARMOUR-PLATES. The employment of thick slabs of iron to protect the sides of ships of war and the fronts of fortifications, is quite a recent invention; or rather, the modern system is the practical realisation of plans suggested long ago by Meresenne and others. In 1842, Mr Balmano of New York proposed that war-ships should be clad with several thicknesses of iron plate, riveted one upon another, the plates being individually $\frac{1}{4}$ th inch thick. Soon afterwards, Mr Stevens, an American shipbuilder, made further suggestions on the same subject, and other practical men kept the matter before the attention of the authorities in various countries. In 1854, the French sent several floating-batteries to the Black Sea, clad with iron plates; and the English Admiralty hastily imitated this example, producing eight very slow and unmanageable batteries in 1855—1856. Then came in a flood of suggestions for arming our regular ships of war in a similar way. The Admiralty, dismayed at the thought of dismantling the existing fleet, which had cost so much, delayed the subject as long as they could, but without abandoning it. In 1860, the French sent to sea *La Gloire*, a timber-built ship of war, altered from a 90-gun three-decker to a 40-gun corvette, clad with 4 $\frac{1}{2}$ -inch iron plates, having a burden of 3000 tons. This proceeding at once set the English government on the alert; they saw that further delay would be imprudent, and they set about the creation of an armour-clad navy. Many problems had to be solved—whether to case old wooden ships with armour; to build and case new wooden ships; or to build new vessels, of which the hull as well as the armour should be of iron. Then arose further problems—how near the bulwarks should the armour-plates come, how near the bottom of the vessel, how near the stem and stern; also, what thickness of iron, and whether the same thickness in every part.

From 1861 to 1867, the British Admiralty have been engaged on a series of costly constructions and reconstructions, intended to afford eventually solutions to the above problems. Several of the ships built have cost from £300,000 to £450,000 each; several half-finished timber three-deckers have been cut down and converted into iron-clads; and variations of detail almost innumerable have been introduced. Referring to other articles for information on war-ships generally, we here give a list of English vessels which form the iron-clad navy, thrown into groups to facilitate comparison. Those which are wholly clad—i. e., covered with armour-plates in all parts of the hull needing protection—are the *Minotaur*, *Agincourt*, *Northumberland*, *Royal Oak*, *Prince Consort*, *Caledonia*, *Ocean*, *Lord Clyde*, *Lord Warden*, *Royal Sovereign*, *Prince Albert*, *Scorpion*, *Wyvern*, *Erebus*, *Terror*, *Thunderbolt*, *Etna*, *Thunder*, and *Hercules*. Those which are partially clad—i. e., covered with armour-plates only in the more exposed portions—comprise the *Black Prince*, *Warrior*, *Defence*, *Resistance*, *Achilles*, *Hector*, *Valiant*, *Royal Alfred*, *Bellerophon*, *Zealous*, *Pallas*, *Favourite*, *Research*, *Enterprise*, *Viper*, *Vicea*, *Waterwitch*, *Penelope*. Regarded as to the material of which the hulls are mostly built, and on which the armour-plates are laid, the following are timber-built: *Royal Oak*, *Prince Consort*, *Caledonia*, *Ocean*, *Royal Alfred*, *Zealous*, *Lord Clyde*, *Lord Warden*.

ARMOUR-PLATES.

Pallas, Favourite, Research, Enterprise, Royal Sovereign, Etna, and Thunder. The *Vixen* is wood and iron; all the rest are iron. The dimensions and weight of these ships, laden as they are with armour-plates varying from 3 to 7 inches in thickness, are enormous. The load displacement of three of them is about 10,000 tons each; three, 9000 to 10,000; three, 7000 to 8000; ten, 600 to 700; three, 4000 to 6000; and the remainder, under 4000. Whatever the thickness of the armour, the plates are nicely tongued and grooved to fit closely together edgewise. The bolts which fasten them to the ship are generally about two inches thick, expanded at one end to form a head, and having a screw-thread at the other to receive a nut.

It is not yet known whether the thickest armour will resist any shot that can be hurled against it; whether, in other words, the thickest practicable armour will overcome, or be overcome by, the heaviest practicable shot. Experiments at enormous cost have been conducted by the government for some years to determine this important question: a natural result has been that cannon are made larger and larger, and armour-plates thicker and thicker, in the struggle between artillery and ship-building. The experiments (so far as England is concerned) have been conducted principally at Shoeburyness, but also on board the *Thunderer* at Portsmouth. The usual mode is, to construct a target resembling the armed side of one of our iron-clads, and then to try to pierce it with shot fired from guns at various distances. A *Warrior* target, for instance, consists of a 4½-inch armour-plate, backed by 18 inches of teak, and an inner skin of ¾th inch iron; while a *Lord Warden* target has 4½ inches plate, 30 inches teak, and 1½ inch skin. A few examples will serve to illustrate the method of proceeding.

In August 1866, a *Warrior* target was built up at Shoebury—i. e., a target similar in strength and

Fig. 1.—Front View of *Warrior* Target, after practice with 600-pounder Armstrong Gun.

construction to the side of that ship. Alderson's steel shell, Armstrong's conical shell, and Palliser's

Fig. 2.—Back View of do.

chilled-iron shell were fired at it from a 7-inch gun at 200 yards: the Palliser shot excelled the others,

going clean through the target, armour and all, and bursting behind. On another occasion, a Palliser 115-lb. shot went through the target even at an angle of 30° from the perpendicular. The *Lord Warden* target has been pierced by 9½ and 10 inch shot at

Fig. 3.—Section of do., shewing the hole made by the 600-lb. shell, and displacement of the upper plate. a, armour plating, 4½ in. thick (displaced); b, teak backing, 18 in. thick; c, boiler-plate skin, ¾ in. thick; d, wrought-iron beams; e, platform.

a distance of 1000 yards; while the thinner *Warrior* target was pierced at 2000 yards. The *Bellerophon* target is more ponderous than the *Warrior*, having 6-inch armour, 22 inches of teak backing, and 1 inch iron plate behind all. Still more ponderous is the *Hercules* target, with 9-inch armour. Some of the targets tried do not resemble the sides of any particular ships, but have the armour-plate backed up by some peculiar combination of wood and iron which seems to the inventor advantageous. One of these, invented by Mr Chalmers, has attracted much attention by its power of resisting shot and shell. As more than half in number of our iron-clads are weaker than the *Warrior*, and as the *Warrior* target has been repeatedly pierced through and through by the Palliser 115-lb. chilled shell, the future value of those ships in warfare is an anxious problem. Whether artillery will overcome armour-plates 7, 8, and 9 inches in thickness, is a question of calibre and range.

Armour-clad forts are also attracting attention. Various experiments on this subject were made in 1861, 1862, and 1863. In 1864, a line of iron-clad fort was built up at Shoebury, to test several modes of construction. In the same year, the Russian government employed the Millwall Company to build a wrought-iron shield, as an experiment for the defences at Cronstadt. The front was made of 12 inches thick of iron in horizontal bars; this was backed by 14 inches of thickness in upright bars; and the whole strengthened with enormous struts, brackets, ribs, and dovetails of iron. The shield was to form the facing or armour for a battery of three of Krupp's 600-pounder steel guns, and measured 43 feet by 10. The shield, with its foundation-plate, weighed 140 tons. In one experiment at Shoebury, a plate 13 inches thick was placed in front of a mass of granite 14 feet thick, and fired at with 200-pounders: four shots cracked the granite, although the plate was not pierced. The Americans made an experiment in Chesapeake Bay, in September 1866, on a temporary fortification, made of enormous granite blocks faced with 10-inch armour: shots of 430 and 620 lbs. were fired from Rodman guns, at a range of 350 yards, and eleven such shots destroyed the whole fabric. The *Thunderer* has been fitted up as a target-ship at Portsmouth, partly to test very thick plates at very short distances. The plates are fastened to an enormous bulkhead near one end of the ship, and the guns placed near the other end. On one occasion, in 1866, a Palliser 115-lb. chilled shot, with an extra charge of powder, fired at 25 feet off, went clean through a 7-inch plate and 45 inches

of teak bulkhead. On another occasion, in the same year, a *Hercules* target, with a 9-inch plate, was fired at with an 8-inch spherical shot at 30 feet: the shot made a dent 2½ inches deep, but did not further disturb the plate. Some of the plates experimented on in this ship, in March 1867, were 16 feet long, 3½ wide, and 7 inches thick; others were shorter, but 4 feet wide, and weighing 5 tons.

On the relative strength of armour-plates and great guns will depend, not only the general character of future iron-clad navies, but also the employment of iron in fortifications, either as a facing to granite walls, or as a material for revolving turrets, such as have been suggested for Spithead.

Regarded as articles of manufacture, armour-plates were at first produced mainly by hammering, several thicknesses of iron being welded one upon another, at a white heat, by blows of a ponderous steam-hammer; but it is now more customary to produce them by rolling than by hammering—pressure being considered to produce more satisfactory results than percussion. Whatever the thickness of the slab is to be, operations are commenced with plates about an inch thick: these are heated, rolled, cut, piled up, heated and rolled over and over again, until the required thickness is produced. The rollers are placed further and further apart, as the slab becomes thicker and thicker. Some of them are truly enormous masses of metal, solid cylinders 8 feet long by 32 inches diameter. At the Atlas Works of Messrs Brown & Co., Sheffield (the chief manufactory for armour-plates), there has been produced a rolled slab 17 feet long, 7 feet wide, and 14 inches thick, weighing 30 tons; and there is no reason to doubt the power of modern appliances to exceed these dimensions, if necessary. For armour-plates, the metal is very scrupulously selected, and every part of the processes conducted with great caution. The bolts, too, for fastening to the teak are undergoing many experiments, to determine the best form of head at one end, and of screw at the other.

AROKSZALLA'S, a town of Jazygia, Hungary, 44 miles north-east from Pesh, and an entrepôt for the trade between that city and Upper Hungary. It stands in a plain on the Gyöngyös Patak, a small stream, by which it is almost encircled. The surrounding country is fertile, and affords excellent pasture. Pop. 8170.

AROMATICS constitute a class of medicines, which owe their properties to the essential oils, to benzoic and cinnamic acids, to volatile products of distillation, or to odorous glandular secretions. The plants that contribute to this class of medicines are those which yield essences, camphor, or odorous resins, and amongst the families which yield the most important aromatics are the Labiatae, Umbelliferae, Lauraceae, Myrtaeae, Aurantiaceae, Coniferae, Scitamineae, Orchideae, &c. In some cases, the aromatic matter is diffused throughout all parts of the plant, but it is usually condensed in particular organs, such as the root, in the case of ginger and galanga; or the bark, in the case of cinnamon, canella, and cascarella; or the flowers, as in the case of cloves; or the fruit, as in the case of anise and vanilla; or the wood, as in the case of sandal-wood and aloes-wood; or the leaves, as in the case of most of the Labiatae, Umbelliferae, &c.

Aromatics may be arranged in the following sub-classes: (1.) Those in which the active principle is an essential oil, as the oil of thyme, lavender, cajeput, neroli, fennel, &c. (2.) Those containing camphor, or an allied body, such as artificial camphor obtained from turpentine. (3.) Bitter aromatics, in which there is a mixture of a bitter principle and

an essential oil, as chamomile, tansy, worm-wood, &c. These are tonics and vermifuges. (4.) Those of which musk is the type, such as civet and amber; and certain plants with a musk-like odour, such as *Malva moscata*, *Mimulus moschatus*, and *Hibiscus abelmoschus*. (5.) Those containing a fragrant resin, as benzoin, myrrh, olibanum, storax, and the balsams of Peru and Tolu, which possess stimulant properties. (6.) Lastly, those which are artificially produced by destructive distillation, as tar, creosote, benzol, or the various empyreumatic oils.

As a general rule, these substances act as diffusible stimulants of more or less power, and as antispasmodics, while those in which a bitter principle is present act as vermifuges and tonics. The whole class were formerly regarded as possessing disinfectant and antiseptic properties, and there is no doubt that some, as coal-tar, creosote, &c., strongly possess this property. In this country we usually associate aromatics with other medicines; but in France aromatic infusion, lotions, baths, &c., are much prescribed. It will suffice to give the composition of aromatic infusion as an illustration. Take equal parts of the leaves of sage, ordinary and lemon thyme, hyssop, origanum, wormwood, and mint. Infuse 50 parts of these leaves in 100 parts of boiling water.

ARTERECTOMY, or the opening of an artery, is an operation that has been strongly advocated in those cases in which it is desirable to produce a more decided and immediate effect upon the cerebral circulation (as in severe forms of sanguineous apoplexy) than could be produced by ordinary venesection. It is supposed by some surgeons to relieve pressure on the brain more efficiently than opening the jugular vein could do; and whether this is the case or not, it is a simpler and less dangerous operation. The only vessel operated on is either the temporal artery itself or one of its main branches. The operation is a simple one, but should, of course, only be undertaken by a surgeon. To arrest the flow of blood when sufficient has been taken, the artery should be completely divided, and after the parts have been sponged, a compress, or small pad, should be applied to the wound, and secured by a bandage, which must be carefully adjusted, so as, if possible, to remain undisturbed for four or five days, when it may be removed, and the wound covered with a strip of plaster.

ARTERIES, DISEASES OF. Most of the important morbid conditions of the arteries are those which are occasioned by the deposition of *atheroma* (a Greek word signifying a tumour or deposit containing matter like *athérè*, meal or groats) on the free surface of the inner coat of the vessel; a new inner lining to the artery being thus furnished. As *atheroma* has the effect of weakening, enlarging, and occluding arteries, according to the extent and period of the deposition, it is expedient briefly to notice the most important stages of its progress. In the earliest stage, *atheroma* consists of a thin, soft, and clear membrane, lining a part or the whole of the tube. It seems to be a mere addition to the artery, in whose original coats there is no appearance of disease. It is most probably a deposit on the inner surface from the blood. On the inner surface of the new coat, a similar layer gradually forms, and in course of time, becomes the foundation of subsequent formations; and when many strata have thus been deposited, the collective mass ceases to be transparent, and becomes converted into an opaque material similar to hardened albumen, and finally to ligament. Until this consolidation occurs, the coats of the artery are not much affected; but by their adhesion to the hardened deposit, they

lose their strength, elasticity, and natural colour, and their functions are destroyed. The indurated deposit may now undergo one or other of these changes: it may either soften in its interior, in which case it degenerates into a pulpy mass of cholesterine, oil-globules, albuminous and chalky molecules; or it may be converted into a layer of hard, chalky, bone-like matter. This latter change (cretification or ossification) takes place only in the external oldest layers of thick deposits; and nothing intervenes between the bony plate and the middle coat of the artery, for the inner or lining coat partakes in the morbid change. It is obvious that either of these changes (softening or hardening) must gradually lead to disease of the arterial coats generally. The process of change is slow, and the change itself can only be detected in the living subject when it is in an advanced stage. In the radial artery and others which lie superficially, the finger can often detect rings or tubes of chalky matter. Most commonly, however, the state of the arteries is detected by some secondary symptom.

Atheromatous deposit is at first attended with a narrowing of the calibre of the vessel, varying with the thickness of the deposit, and most marked at the points of bifurcation. Smaller arteries may be completely obliterated, whilst the larger arteries may be very much contracted. Thus, the common iliac has been found to have its canal diminished by about one half, and the great ascending branches of the arch of the aorta, the subclavian and carotid arteries, have been found very nearly closed. A later consequence of the same disease is dilatation of the vessel. The power of the outer coats being insufficient to compress the deposit and to close in upon the blood, by which each contraction of the left ventricle of the heart distends them, they remain wide and distended during the relaxation of the ventricle, and the artery thus slowly expands; the enlargement being most marked at parts where there is most obstruction to the blood-current, as, for example, in curved arteries. These dilatations are apt to terminate in regular aneurism. The changes which we have already described have an effect on the retractile power of the arteries. A healthy artery, if cut across, may shorten to the extent of an inch and a half, as has been actually measured by Mr Moore ('Diseases of the Arteries,' in Holmes's *System of Surgery*, vol. iii. p. 329); but the retractile power is destroyed by the deposition of bony rings or plates. But although incapable of shortening, the arteries sometimes become abnormally lengthened, and consequently become not only dilated, but also tortuous. If the outline of superficial arteries thus affected be watched, each pulsation of the heart is seen to increase their curvature; and deep-seated arteries (as the iliac) are thus often forced from their normal positions. Another condition involving much danger is this: an ossified artery loses the smoothness which the interior of the vessel ought to present, and from the displacement or cracking of a bony plate, there may be sharp rough projections exposed, to which the fibrin of the circulating blood may adhere. These little clots becoming detached, may be carried with the blood till they become arrested, and plug up an artery, thus presenting cases of embolism or Thrombosis (q. v.). Again, the relation of this disease to accidents and surgical operations on arteries is obvious. A blow may crush a diseased artery, when a healthy elastic vessel might have escaped injury. Such a slight movement as suddenly lifting the arm to the head, for the purpose of securing the hat in a sharp gale, has been known to have been followed by aneurism of the axillary artery. A ligature applied to any ossified artery, is very apt to

cause it to break, and the difficulty of securing such vessels is often very great. It is to this form of disease that most of the failures of operations for aneurism are due. Having thus noticed the most important changes which are induced in the arteries by atheroma, and the evil consequences to which they may give rise, we shall now direct attention to an important cause of occlusion—that, namely, in which the canal is closed by an imported foreign body, and especially by fibrous plugs originally formed in the heart, and transported to other parts in the stream of the blood. When a large artery, as, for example, the principal artery of one of the limbs, is 'suddenly plugged in its higher part, a sensation of severe pain is commonly the immediate result of the accident. In some cases, the pain extends along the course of the vessel, which, though pulseless, is extremely tender; in others, the suffering is referred to some distant part of the limb, as, for instance, to the calf. Signs of a deficient circulation succeed, and they may amount to pallor, loss of temperature, numbness of the surface, or even to that "torpor" which is observed to precede the total death of a limb in certain cases of injuries of vessels. Such torpor implies not only a loss of circulating blood, but also a cessation of all feeling and motor power in the limb.'—Moore, *op. cit.*, p. 335. Although Gangrene (q. v.) is always to be feared as the result of an obstructed artery of large size, it does not invariably follow; as a collateral circulation may be established, and the life of the limb may be thus saved. Very young persons will endure the obliteration of very large vessels without gangrene; and a case is on record (*Med. Chir. Trans.*, vol. xxix. p. 214) in which 'all the main arteries of both upper extremities and of the left side of the neck were reduced to solid cords,' and yet no gangrene ensued. From the description of the symptoms, the nature of a case of sudden occlusion of a large artery by a plug may possibly be recognised, or, at all events, suspected even by a non-professional observer. Medical aid must at once be sought. The early indications of treatment are to preserve the temperature of the part, to favour the establishment of a collateral circulation, to protect the limb from irritation or injury, to give nourishing blood-making food, and to relieve pain by the judicious use of opiates. The later treatment, if the affection is not checked, is that which is described in the article GANGRENE.—*Arteritis, or Inflammation of the Arteries*, was a disease which was formerly recognised by physicians. No such specific general disease is now believed in; but the changes which have been already described as occurring in consolidated atheromatous deposits—either softening or ossification—are accompanied by an unnaturally vascular condition of the attenuated arterial walls, extending to true local inflammation, and even to suppuration.—*Aneurism* (a tumour containing blood, and communicating with the cavity of an artery) has been considered in a special article.

ARTIFICIAL LIMBS. With the exception of the celebrated artificial hand of the German knight, Götze von Berlichingen*—who flourished

* The iron hand of this knight, who has been immortalised by Goethe, is preserved at Jaxthausen, near Heilbronn, and a duplicate of it is in the Schloss at Erbach, in the Odenwald. It is stated in Scott's *Border Antiquities*, vol. ii., p. 206, that the family of Clephane of Carlisle 'have been in possession from time immemorial of a hand made in the exact representation of that of a man, curiously formed of steel,' which was conferred by one of the kings of Scotland on a laird of Carlisle, who had lost his hand in the service of his country.—See *Notes and Queries* for July 17, 1867, p. 35.

ARTIFICIAL LIMBS.

in the early part of the 16th c. (1513), and who was named *The Iron-handed*—which weighed three pounds, was so constructed as to grasp a sword or lance, and was invented by a mechanic of Nuremberg, our knowledge of artificial limbs dates from the time of Ambrose Paré, whose *Euvres de Chirurgie* were published in 1575. The twelfth chapter of that volume, as translated by

Fig. 1.

Thomas Johnson in 1605, shews 'by what means arms, legs, and hands may be made by art, and placed instead of the natural arms, legs, and hands that are cut off or lost.' The accompanying figures

Fig. 2.

are copies of his drawings of 'an hand made artificially of iron (fig. 1),' and of 'the form of an arm made of iron verie artificially (fig. 2).' He also gives a drawing of 'a wooden leg made for a poor man' (fig. 3), which is simply the common wooden leg with bucket receptacle still in use. No improvements worthy of record were made from the time of Ambrose Paré to the beginning of the present century, when Baillif of Berlin constructed a hand which did not exceed a pound in weight, and in which the fingers, without the aid of the natural hand, not only exercised the movements of flexion and extension, but could be closed upon and retain light objects, such as a hat, and even a pen. 'Artificial hands,' says Mr Heather Bigg, 'are now constructed, by means of which a pin may be picked up from the ground, a glass raised to the lips, food carried to the mouth, and a sword drawn from its scabbard, and held with considerable firmness; while a combined arm and hand is fabricated, which is equal to the ordinary requirements of histrionic declamation.'—*Orthoprazy*, 1865, p. 157. The utility of an artificial arm depends much on the nature of the stump. A stump above the elbow is best suited for an arm when it gradually tapers to its lowest end, and terminates in a rounded surface. When an arm is removed at the shoulder-joint, and there is no stump, an artificial arm can still be fixed in its proper place by means of a corset. In amputation below the elbow-joint, the best stump

is one which includes about two-thirds of the forearm; while a stump formed by amputation at the wrist is very unsatisfactory. The simplest form of artificial arm intended to be attached to a stump terminating above the elbow, 'consists of a leathern sheath accurately fitted to the upper part of the stump. The lower end of the sheath is furnished with a wooden block and metal screw-plate, to which can be attached a fork for holding meat, a knife for cutting food, or a hook for carrying a weight.'—*Op. cit.* p. 160. The arm should be so carried as to represent the position of the natural arm when at rest. It is retained in its position by shoulder and breast straps, and forms a light, useful, and inexpensive substitute for the lost member. More complicated, and therefore more expensive pieces of apparatus are made, in which motion is given to the fingers, a lateral action of the thumb is obtained, and the wrist-movements are partially imitated; and a degree of natural softness is given to the hand by a covering of gutta-percha and India-rubber. Such a hand, says Mr Bigg, is often more symmetrical in aspect than the natural hand, but it possesses no efficient grasping power. Hence provision has to be made for attaching various instruments to its palm, such as special hooks, which can be removed at pleasure, for driving, shooting, &c.; apparatus for using the knife and the fork, for grasping the pen, &c.: indeed, the number and variety of instruments capable of being applied to an artificial hand are extremely great. Nothing has tended so much to the very highest development of artificial arms and hands, as an accident which happened nearly a quarter of a century ago to the celebrated French tenor, M. Roger, who lost his right arm above the elbow. It was necessary, for his future appearance on the stage, that he should have an artificial limb, which would serve the purposes of histrionic action, and permit him to grasp a sword and draw it from its scabbard. Such a contrivance was invented in 1845 by Van Petersen, a Prussian mechanic, and the French Academy of Sciences commissioned MM. Gambey, Rayer, Velpeau, and Magendie to report upon it. For a history of the nature of the limb, the reader is referred to the report which appeared in the *Comptes Rendus* for that date, or to Mr Bigg's *Orthoprazy*, pp. 176—181. The apparatus, which weighs less than 18 ounces, was tested upon a soldier who had lost both arms. By its aid he was enabled to pick up a pen, take hold of a leaf of paper, &c.; and the old man's joy during the experiment was so great, that the Academy presented him with a pair of these arms. Van Petersen's conceptions have been extended and improved by Messrs Charriere, the celebrated surgical mechanics of Paris, aided by M. Huguier, the well-known surgeon. A very marvellous arm has also been almost simultaneously constructed by M. Bechard, which, 'by means of a single point of traction, placed in pronation, executes first the movement of supination, next in succession the extension of the fingers and abduction of the thumb: the hand is then wide open.'—Bigg, *op. cit.* p. 190.

Artificial legs having fewer requirements to perform than artificial arms, are comparatively simple in structure. We borrow the description of our figure of the ordinary bucket leg in common use

Fig. 3.

amongst the poorer classes from Mr Bigg's *Ortho-praxy*. 'It consists of a hollow sheath or bucket, A, accurately conformed to the shape of the stump, and having—in lieu of the more symmetric proportions of the artificial leg—a 'pin,' B, placed at its lower end to insure connection between it and the ground. This form of leg is strongly to be recommended when expense is an object, as it really fulfils all the conditions excepting external similitude embraced by a better piece of mechanism. It is likewise occasionally employed with benefit by those patients who, from lack of confidence, prefer learning the use of an artificial leg by first practising with the commonest substitute.' As, when the body rests on a single leg, the centre of gravity passes through the tuberosity of the ischium, it is essential that the bucket should be so made as to have its sole point of bearing against this part of the pelvis.

Of the more complicated forms of artificial leg three are especially popular. The first of these is of English origin, and owing to its having been adopted by the late Marquis of Anglesea, is known as the *Anglesea leg*. For a description of it, the reader is referred to Gray's work on *Artificial Limbs*, one of the firm of Grays having been the constructor of the legs used by the marquis. This was for a long time the fashionable artificial leg. The second leg worthy of notice is that invented by an American named Palmer, and called the *Palmer leg*. From its lightness and the greater ease of walking with it, it has long superseded the Anglesea leg in America. In the third of these legs, also invented in America, and known as *Dr Bly's leg*, the principal faults of the two other legs have been completely overcome. The advantages of this leg are thus summed up by Mr Bigg, who has fully described and figured its mechanism: (1.) Adaptation to all amputations either above or below the knee. (2.) Rotation and lateral action of the ankle-joint. (3.) Power on the part of the patient to walk with ease on any surface, however irregular, as, owing to the motion of the ankle-joint, the sole of the foot readily accommodates itself to the unevenness of the ground, which is an advantage never before possessed by any artificial limb. (4.) The ankle-joint is rendered perfectly indestructible by ordinary wear, owing to its centre being composed of a glass ball resting in a cup of vulcanite; thus it never gets out of repair, as the Anglesea leg but too frequently does, and the original cost is almost the only one the patient incurs. (5.) The action of the ankle-joint is created by five tendons, arranged in accordance with the position assigned to them in a natural leg. These tendons are capable of being rendered tight or loose in a few instants, so that the wearer of the leg has the power of adjusting with precision the exact degree of tension from which he finds the greatest comfort in walking, and also of giving the foot any position most pleasing to the eye. (6.) There is a self-acting spring in the knee-joint, urging the leg forward in walking, and imparting automatic motion, thus avoiding the least trouble to the patient, who finds the leg literally and not metaphorically walk by itself. (7.) The whole is covered by a beautiful flesh-coloured enamel, thus avoiding the clumsy appearance of the wood, as is always found in an Anglesea leg, admitting of its being washed with soap and water like the human skin. (8.) At the knee-joint there is a mechanical arrangement representing the crucial ligaments, and affording natural action to that articulation by which all shock to the stump in walking is avoided. This leg is patented, and as might be expected, is somewhat expensive.

In cases of arrested development of the lower

limbs, short-legged persons may be made of the ordinary height by the use of two artificial feet placed twelve or more inches below the true feet, and attached to the legs by means of metallic rods, jointed at the knee and ankle.

Other parts not entitled to be called limbs, can also be replaced by mechanical art—such as the nose, lips, ears, palate, cheek, and eye. In the present advanced state of plastic surgery, deficiencies of the nose, lips, and palate can usually be remedied by an operation; cases, however, may occur where an artificial organ is required. Artificial ears are moulded of silver, painted the natural colour, and fixed in their place by a spring over the vertex of the head. Loss of an eye causes sad disfigurement; but the artificial eyes of Boissonneau (see his *Renseignements Généraux sur les Yeux Artificiels, leur Adoption et leur Usage*), which have been shewn in all the recent public exhibitions, completely throw all others in the shade, and cannot be detected without the closest inspection. For further details on all these subjects we must refer to Mr Bigg's volume, which is a complete encyclopædia on these and allied topics.

ARTVIN, a town of Asiatic Turkey, in the pashalic of Trebizond, 100 miles east from the town of Trebizond. It is situated in a ravine, on the Tchoruk, which is here crossed by a bridge. The houses are mostly built of wood, but some are of stone. The inhabitants mostly belong to the Roman Catholic Church. Olive and mulberry groves mingle with the houses. There is some trade in butter, wax, honey, olives, and oil, the products of the neighbourhood. Pop. supposed to be about 6500.

ARZIGNA'NO, a town of North Italy, 11 miles west-by-south from Vicenza, in a plain surrounded by hills, near the Agno. It has manufactures of woollens, leather, and silk twist, also an active trade in wine and in cattle. In the neighbourhood are brick-works, lime-works, and coal mines. Pop. 7287.

ASCH, a town of Bohemia, in the extreme west of that country, close to the border of Franconia, about four miles north from the Erzgebirge, on a small affluent of the Eger, and 100 miles west-north-west from Eger. It has cotton, linen, and woollen manufactures. Pop. 7420.

ASCIA'NO, a town of Tuscany, North Italy, in the province of Siena, 12 miles south-east from Siena, on the left bank of the Ombrone. The town stands on the slope of a hill. Its churches contain some fine pictures. Pop. 2082.

A'SHBORNE, or ASHBURN, a market-town of Derbyshire, England, a short distance from the left bank of the Dove, in a fertile valley, amid beautiful scenery, 13 miles north-west from Derby. The streets are pretty regular, the houses mostly of brick. The parish church of A. is supposed to have been erected in the 13th century. There are a grammar and a free school, and a number of well-endowed charities. The cotton manufacture is carried on here to a considerable extent; the lace manufacture to a small extent; and there is an active trade in malt and cheese. A. is connected by a branch with the North Staffordshire Railway. Pop. (1861) 3501.

ASHTAB'ULA, a rapidly increasing town of the state of Ohio, North America, on the Cleveland and Erie Railway, 3 miles from Lake Erie, and 49 miles north-east from Cleveland. It stands on a river of the same name, which flows into Lake Erie, and at the mouth of which there is a harbour. It is a place of considerable trade. Pop. (1860) 12,000.

ASIA'GO, a town of North Italy, 22 miles north

from Vicenza. It stands on a ridge, among the southern spurs of the Alps. It is celebrated for the manufacture of straw-hats, and also for carpenter-work and turning. Pop. 5140. The surrounding district, known as the 'Seven Communes,' is well wooded, and abounds in sheep and cattle (see *SETTÉ COMUNI*).

ASINALUNGA, or **SINA LONGA** (anc. *Ad Meusulas*), a town of Tuscany, North Italy, in the province of Siena, 22 miles south-east from Siena, on the Siena Railway. It is beautifully situated on hills bordering the Val di Chiana, and is a well-built town, with wide and well-paved streets, and a handsome collegiate church, in which are many fine paintings. Pop. of commune (1861) 8330.

ASO'CA (*Jonesia Asoca*), an Indian tree of the natural order *Leguminosae*, sub-order *Cesalpinea*, remarkable for the beauty of its red and orange flowers. The leaves are abruptly pinnate, shining, and very beautiful. The A. is often mentioned in Indian poetry, and is connected also in various ways with the Hindu mythology.

ASO'LA, a fortified town of Northern Italy, in the province of Brescia, situated on the left bank of the Chiese, 19 miles west-north-west from Mantua. It is a place of great antiquity. The chief branch of industry, not agricultural, is the manufacture of silk twist. Pop. of commune (1861) 5441.

ASPARAGINE ($C_8H_9N_3O_6 \cdot 2H_2O$) is a crystalline substance which exists ready formed in common asparagus, in the marsh-mallow, in comfrey, in potatoes, in chestnuts, in the leaves of the deadly nightshade, in liquorice-root, in the milky juice of the lettuce, in the tubers of the dahlia, and in the young shoots of vetches, peas, beans, &c. According to Piria, the young shoots of these plants, when formed in the light, contain as much asparagine as when they are grown in the dark, but the asparagine disappears as the plant arrives at the flowering stage. Other chemists, including Pasteur, find that vetches grown in light are free from asparagine. This substance is readily obtained from the expressed juice of the young shoots of asparagus, of young vetches, &c., which, after filtration and evaporation to a syrup, soon deposits it in crystalline prisms of a right rhombic form. These crystals dissolve freely in boiling water, the cooled solution having a mawkish and cooling taste, and a slight acid reaction. Asparagine exhibits two remarkable transformations. (1.) When its aqueous solution is heated with alkalis or acids, it is decomposed into aspartic acid ($C_8H_7NO_6$) and ammonia; from this and other reactions, there is no doubt that it should be regarded, according to modern views, as the Amide (q. v.) of aspartic acid. (2.) While a solution of pure asparagine-crystals remains unchanged, if any colouring matter is present the solution passes into fermentation, and the whole of the asparagine is converted, by the assimilation of hydrogen, from the pigment into succinate of ammonia, a reaction which may be expressed as follows:

Like most of the amides, this substance unites both with acids and alkalis, but the resulting compounds are of little general interest. That asparagine plays an important part in the physiology of plants, is obvious from its wide distribution.

A'SPÉ, a town of Valencia, Spain, in the province of Alicante, and 21 miles west from Alicante, near the river Elcha. It is pretty well built, but the streets are narrow and winding. It has numerous flour-mills and oil-mills, also soap-manufactories and

brandy distilleries. There is a considerable trade in wine. Pop. 6744.

ATE'SSA, a town of South Italy, in the province of Chieta, and 23 miles south-south-east from Chieta. It has a beautiful collegiate church, and several other churches and convents. Pop. of commune, 9171.

A'THERSTONE, a market-town of Warwickshire, England, on the borders of Leicestershire, 16 miles north-east from Birmingham; in a valley surrounded by finely wooded hills, on the Roman road called Watling Street, the Trent Valley Railway, and the Coventry and Fazely Canal. The town is irregularly built; many of the houses are very ancient; the old houses are of stone, the modern ones of brick. Some of the modern churches and other public buildings are handsome structures. Hats, stockings, and ribbons are manufactured here. Pop. (1861) 3857.

ATLANTIC TELEGRAPH. Referring to other articles for details concerning the scientific and mechanical principles of electro-telegraphy, the Atlantic cables may more especially be described here.

The possibility of laying an electric cable in the Atlantic, from Europe to America, was suggested by Professor Morse so far back as 1843; but it was not until 1854 that Mr Cyrus Field and others discussed the means of practically realizing the idea. Lieutenant Maury discovered that the bed of the Atlantic, between Ireland and Newfoundland, forms a kind of plateau, covered with soft ooze, favourably situated as a resting-place for a cable. In 1855, negotiations were carried on, partly in America, but chiefly in England, to establish a company and raise capital; which objects were attained in 1856. The 'New York and Newfoundland Telegraph Company' connected Newfoundland with the mainland of America by cables and land-wires; but the 'Electric Telegraph Company' undertook the laying of a cable from Newfoundland to Ireland, with a capital of £350,000, in shares of £1000 each. A length of 2500 English miles of cable was ordered, and was completed by the summer of 1857. The conductor consisted of 7 fine copper wires, No. 22 gauge, twisted tightly together, forming a cord $\frac{1}{4}$ th inch thick, and weighing 107 lbs. per mile. This thickness was increased to $\frac{3}{4}$ th inch by a core of three layers of gutta percha. Outside the core was a jacket of hempen yarn, saturated with pitch, tar, bees-wax, and boiled linseed oil. The outer sheath consisted of 18 strands, each formed of 7 No. 22 iron wires. The whole diameter was about $\frac{1}{2}$ th inch, and the weight 1 ton per mile. In the manufacturing processes, the wires and yarns were twisted round each other by revolving drums and circular tables worked by steam-power; while the coatings of gutta percha were applied by forcing the substance through dies which had the copper conductor passing through their centre. The *Niagara* and the *Agamemnon*, the one lent by the United States government and the other by the English, took 1250 miles of the cable each, and steamed forth from Valentia (west coast of Ireland) on August 7, 1857. The *Niagara* paid out her portion of cable as she went. On the 11th, in an attempt to slacken the rate of paying out, the cable snapped, and the end sank in 2000 fathoms water, at 280 miles from Ireland. The appliances on board were not sufficient to remedy the disaster, and the two ships returned to Plymouth, where the two portions of cable were placed in tanks until the next following year.

The Atlantic Telegraph Company raised more capital, made 900 miles additional cable, and prepared for a new attempt in 1858. The *Niagara* and

ATLANTIC TELEGRAPH.

Agamemnon were again employed; but the submersion was to begin in mid-ocean, one ship proceeding eastward, and the other westward, after splicing the two halves of the cable. They left Valentia, June 10; but it was not till the 26th that they could finish the splice and commence the submersion. On the 29th, a double breakage took place, and 144 miles of cable went to the bottom, wholly severed from the rest. The *Agamemnon* returned to England for improved appliances and further instructions; and a month was thus lost. On July 29, the two ships again spliced their two halves of cable in mid-ocean, and proceeded with their work without further disaster. On August 6, the *Agamemnon* reached Valentia, and the *Niagara* Newfoundland, and exchanged congratulatory messages through the whole length of cable. Soon afterwards, greetings were exchanged between the Queen and the President, and between many public bodies and official persons. The station at Newfoundland was

connected by wires and cables with the general telegraphic system of America; and that at Valentia with the general system of Europe. The cable continued working until September 1, sending 129 messages (of about 11 words each on an average) from England to America, and 271 from America to England. The signals then ceased, and the cable has never spoken since; it is supposed to have been injured by the winter's sojourn at Plymouth.

From 1858 to 1864, the Company were engaged in endeavouring to raise new capital, and to obtain increased subsidies from the English and American governments; while scientific men were making improvements in the form of cable, and in the apparatus for submerging it. At length the Telegraph Construction and Maintenance Company (formed by an amalgamation of the Gutta Percha Company with the wire-cable-making firm of Glas and Elliott) made an entirely new cable, much thicker and more costly than the former one. The

Great Eastern paying out the Atlantic Cable.

conductor, 300 lbs. per mile, and $\frac{1}{4}$ th inch thick, consisted of seven No. 18 copper wires, each $\frac{1}{16}$ th inch thick. The core was formed of four layers of gutta percha alternating with four of Chatterton's Compound (a solution of gutta percha in Stockholm tar); the core and conductor together were 700 lbs. per mile, and $\frac{1}{8}$ th inch thick. Outside this was a jacket of hemp or jute yarn, saturated with preservative composition. The sheath consisted of 10 iron wires, No. 13 gauge, each previously covered with 5 tarred Manilla yarns. The whole cable was $1\frac{1}{4}$ th inch thick, and weighed $35\frac{1}{2}$ cwt. per mile, with a breaking strain of 7 $\frac{1}{2}$ tons. During the processes of manufacture, the electrical quality of the cable was tested to an extent never before practised. The portions of finished core were tested by immersion in water at various temperatures; then under a pressure of 600 lbs. to the square inch, to imitate the ocean pressure at a profound depth; then the

conduction of the copper wire was tested by a galvanometer; and then the insulating property of the gutta percha, by various means. After the pieces had in these ways been tested, they were spliced end to end, and then the splices or joints tested. Nothing was taken 'upon trust.'

As the cable (2300 miles) weighed more than 4000 tons, it was resolved to employ the *Great Eastern* steam-ship to carry it out and lay it. Three enormous iron tanks were built in the fore, middle, and aft holds, from 50 to 60 feet diameter each, by 20 $\frac{1}{2}$ feet deep; and in these the cable was deposited, in three vast coils. On July 23, 1865, the *Great Eastern* started from Valentia with her burden, the main cable being joined end to end to a more massive shore cable, which was drawn up the cliff at Foilhummerum Bay, to a telegraph house at the top. The electric condition of the cable was kept constantly under test during the progress of the

ship; and more than once, the efficiency was disturbed by fragments of wire piercing the gutta percha, and destroying the insulation. On August 2, the cable snapped by over-straining, and the end sank to the bottom, in 2000 fathoms water, at a distance of 1064 miles from Ireland. Then commenced the remarkable process of dredging for the cable. A five-armed grapnel, suspended from the end of a strong iron-wire rope, five miles long, was thrown overboard; and when it reached the bottom, it was dragged to and fro across the line of cable by slow steaming of the *Great Eastern*; the hope being that one or other of the prongs would catch hold of the cable. A series of disasters followed, by the breaking of swivels, and the loss of grapnels and ropes; until at length, on August 11, it was found that there were no more materials on board to renew the grappling. The *Great Eastern* returned to England, leaving (including the operations of 1857—1858) nearly 4000 tons of electric cable useless at the bottom of the Atlantic.

A new capital, and new commercial arrangements altogether, were needful for a renewal of the attempt. Another cable was made, slightly differing from the former. The jacket outside the core

near to it as calculations could establish. Certain buoys, left anchored there twelve months previously, had been carried away by the storms of the preceding winter; but the latitude and longitude had been very carefully registered. The *Great Eastern* started from Heart's Content on the 9th, and then commenced a series of grappling operations, which continued through the remainder of the month. The cable was repeatedly caught, and raised to a greater or less height from the ocean-bed; but something or other snapped or slipped every time, and down went the cable again. At last, after much trial of patience, the end of the cable was safely fished up on September 1; and electric messages were at once sent through to Valentia, just as well as if the cable had not had twelve months' soaking in the Atlantic. An additional length having been spliced to it, the laying recommenced; and on the 8th the squadron entered Heart's Content; having thus succeeded in laying a second line of cable from Ireland to America.

During the winter 1866—1867, the two cables continued to work uninterruptedly; but in May 1867, the 1866 cable was injured by an iceberg, which scraped over it about three miles from the Newfoundland shore; but the damage was soon repaired; again in July 1867, the same cable broke about fifty miles from the Newfoundland coast. The earlier cable, that of 1865, is up to the present time (August 1867) in perfect working order. The charge for telegraphic messages was at first very high, £20 for 20 words and under; but this was reduced in 1866 to £10, which is still (Sept. 1867) the rate. The increase of trade more than counterbalanced this decrease of charge; the cables gradually earned more than £1000 a day on an average. The rapidity of telegraphing has increased from 2 words per minute (in the old 1858 cable) to 8 or 10—

Section and External Appearance of Atlantic Cable of 1866.

was made of hemp instead of jute; the iron wires of the sheath were galvanised, instead of being left in their natural state; and the Manila hemp which covered them was left white instead of being tarred. These few changes made it weigh nearly 500 lbs. per mile less, mainly through the absence of tar; while its strength or breaking strain was increased. Enough of this cable was made to span the Atlantic, with allowance for slack; while a sufficient addition of the 1865 cable was provided to remedy the disaster of that year. Everything connected with the stowing of the cables in the ship, the rate of speed, the paying out, the testing during the voyage, the grappling in case of breakage, and the apparatus for signalling, was rigorously examined, and numerous improvements introduced.

The Atlantic telegraph operations in 1866 were of a remarkable and interesting kind. On July 13, the *Great Eastern* set forth from Valentia, accompanied by the steamers *Terrible*, *Medway*, and *Albany*, which were to assist in the submersion and in subsidiary matters. The line of route was chosen midway between those of the 1858 and 1865 cables, for the most part a few miles from each. The *Great Eastern* exchanged telegrams almost continuously with Valentia during her progress. The mishaps were few in number, and easily remedied; and the *Great Eastern* safely entered the harbour of Heart's Content, Newfoundland, on the 27th. There then ensued a series of congratulatory messages similar to those of 1858. After this, operations commenced for recovering the end of the 1865 cable, and completing the submersion. The *Albany*, *Medway*, and *Terrible* set off, on August 1, to the spot on the ocean beneath which the end of the cable was lying, or as

even 16 for familiar conversation. As the apparatus employed is now exquisitely sensitive, feebler impulses will suffice; and this is found to be better for the cable. As an experiment, one drop of acid and one morsel of zinc, in a percussion cap, have produced battery power enough to send an impulse through the whole length of cable.

A short new cable, 42½ cwt. per mile, was laid in the summer of 1867, to replace the former one from Newfoundland to Cape Breton.

Several plans have been proposed for telegraphic cables to cross the Atlantic, some north, and some south of the existing lines. One that meets with considerable favour would go *via* Scotland, Farøe Islands, Iceland, Greenland, and Labrador; it would, in fact, consist of four cables, with connecting land-wires.

A'TRI (anc. *Hadria Picena*), a town of South Italy, in the province of Teramo, and 14 miles south-east from Teramo, on a steep hill, 6 miles from the Adriatic. It is of very great antiquity, and some of its coins bear a legend in Etruscan characters. Numerous remains of public buildings, baths, and walls attest its ancient importance. In a hill near the town are some remarkable subterranean chambers, supposed to be excavations of a very remote age. They are formed with the greatest regularity, but their purpose is unknown. A. is a bishop's see. It has an aspect of stagnation and decay. Pop. 3632.

ATROPIA, or A'TROPINE (C₂₄H₂₃NO₃), is an alkaloid existing in all parts of the deadly nightshade (*Atropa Belladonna*), and in the seeds of the thorn-apple (*Datura stramonium*); hence it has also been called DATURIA or DATURINE. The Pharmacopœial directions for extracting it from the roots of

belladonna by means of alcohol are somewhat complicated. It is first taken up in combination with malic acid, which is removed by the addition of lime; sulphuric acid is then added, which throws down the lime and forms sulphate of atropia: the atropia is liberated by carbonate of potash, which also separates and resolves impurity, and is taken up by chloroform, which, after being distilled off, leaves atropia, which must be finally purified by decolorisation with charcoal, and crystallisation from an alcoholic solution. The crystals occur in colourless silky needles, united in tufts. It is so highly poisonous, that no one has ventured to use it internally in medicine. A single drop of a solution containing one grain of atropia, one minim of nitric acid, three minims of spirit, and a drachm of distilled water, let fall on the lower eyelid, will dilate the pupil to fully double its ordinary size in the course of about ten minutes, the dilatation lasting for four or five days. The solution thus used is now generally preferred to the dirty practice of smearing the vicinity of the eye with belladonna ointment, in all those cases in which the oculist requires the pupil dilated.

ATROWLI, a town of British India, the chief place of a pergunnah of the same name, in the district of Allypore, North-west Provinces, 63 miles north-north-east from Agra. The streets are wide, the bazaar good, and the supply of water abundant. Pop. 12,722.

AUBAGNE (anc. *Albania*), a town of the dep. of Bouches-du-Rhône, France, stands on the Huveaune, 9 miles east from Marseille, with which it is connected by railway. It is built with some regularity and elegance. The ancient town stood on a hill, at the base of which the present town is situated. It was the capital of the Albicci, who were subdued by Julius Cæsar. The castle, once of great strength, is now in ruins. The church was founded in 1164. This town is a place of considerable activity, manufacturing pottery, tiles, paper, &c. It has also tanneries and distilleries. Pop. (1866) 4538.

AUBUSSON, a town of the dep. of Creuse, France, 125 miles west from Lyon. It is picturesquely situated on the Creuse, in a narrow valley or gorge, surrounded with mountains and rocks. It is a well-built town, consisting chiefly of one broad street. It is celebrated for the manufacture of carpets, which is said to have been introduced by the Arabs or Saracens, who settled here in the 8th century. Tanning and dyeing are carried on, and there is some trade in wine. Pop. (1866) 6061.

AUGIER, **GUILLAUME VICTOR EMILE**, a French dramatist of considerable reputation, was born at Valence, on the 17th of September 1820, and was educated for the profession of an advocate. He soon, however, shewed a predilection for letters, especially the drama. In 1844, he composed a piece in two acts, and in verse, entitled *La Ciguë*, which he offered to the Théâtre Français, but without success. The Odéon, however, received it, and it was played at that theatre with considerable applause for nearly three months. This, while it is the first, is said to be likewise the best of A.'s works, containing some excellent moral lessons, set in a framework of the antique, and made attractive by elegant versification. In the following year, the Théâtre Français sought his services, and he produced for that theatre his second comedy, entitled *Un Homme de Bien*, in three acts, and in verse. This was a comedy of the day, and was only partially successful. A third, *L'Aventurière*, which appeared in 1848, was better received; still there was said to be too much of common-place in the moral sentiments with

which it abounded. *Gabrielle*, in five acts, and in verse, which appeared in 1849, was also a highly moral piece, and gained for its author the Monthyon prize. In 1852, A. wrote a drama, entitled *Diane*, in which Rachel took the principal part, but in spite of all her efforts it proved a failure. He was more fortunate with *La Pierre de Touche*, a prose comedy in five acts, written in partnership with Jules Sandeau, and produced in 1853. In the same year he wrote a verse-comedy, in three acts, entitled *Philiberte*, said to be a charming *genre* piece, in which the grace of the details supplies the absence of intrigue. His subsequent pieces, however, belong all more or less to the comedy of intrigue. Such are *Le Mariage d'Olympe*; *Le Gendre de M. Poirier*, written in partnership with Jules Sandeau; and *La Revanche de Georges Dandin*—all produced in 1855; *La Jeunesse*, in 1858; *Les Lionnes Pauvres*, in the same year, written in conjunction with E. Fournier; and the *Beau Mariage*, also in conjunction with Fournier, in 1859. Either singly or in conjunction with others, M. A. has also written *Les Effrontés*, *Le Fils de Giboyer*, *Maitre Guérin*, *La Chasse au Roman*, *L'Habit Vert*, and *Sapho*—the last mentioned an opera, the music by Gounod. In 1856, he published a small volume of *Poésies*, some of which are very elegant both in thought and expression. Usually, A. is regarded as one of the leaders of the school of good sense; in his later pieces, however, approaching too much to the manner of the younger Dumas. In 1858, M. A. was elected a member of the Académie Française in the place of Salvandy, and in the same year was promoted to the rank of officer in the *Legion d'Honneur*.

AUGUSTOWO, a town of Poland, the capital of a circle of the same name, on the Netta, a feeder of the Bug, 138 miles north-east from Warsaw. It was founded by Sigismund Augustus, king of Poland, in 1557. It has woollen and linen manufactories, and some trade in horses and cattle. Great part of the surrounding district is occupied by lakes and marshes, or covered with forests. Pop. 8494.

AULAPOLAY', or **ALEPPI**, a town of India, in the native state of Travancore, on the sea-coast, in 9° 30' N. lat., and 76° 24' E. long. There is no shelter for shipping, but ships anchor four or five miles from the shore. There is, however, a considerable trade in timber, betel-nut, coir, pepper, and cardamoms. This town communicates with Quilon and Trivandrum on the south, and with Cochin on the north, by canals parallel with the sea-coast, and connecting a series of lakes or back-waters. Between these and the sea is a communication by a wide creek, through which the timber for exportation is floated, which is brought from the forests of the Rajah of Travancore on the Western Ghauts.

AUMALE, a town of Algeria, on one of the head-waters of the Sahel, 57 miles south-east from Algiers. It is situated on the great road from Algiers to Constantine. It is a strong military post, with barracks, magazines, and hospitals. Pop. (1861) 5196, of whom 1468 are Europeans.

AUSTIN, **JOHN**, a distinguished writer on jurisprudence, was born on March 3, 1790. At the age of 16, he entered the army, and served as a subaltern with his regiment in Sicily. But he left the service after the peace, and in 1818 was called to the bar. In 1820, he married Miss Sarah Taylor of Norwich (see following article), to whom he had been attached for many years, and went to live in Queen Square, Westminster, next door to Jeremy Bentham and Mr James Mill. In their society, his attention was naturally turned to the subjects he afterwards cultivated with success. He was compelled by bad

health to abandon his practice at the bar, about the time when the university of London was founded, and he then received the appointment of Professor of Jurisprudence. To fit himself for the chair, in the autumn of 1827 he settled at Bonn, then the residence of Niebuhr, Brandis, Schlegel, Arndt, Welcker, and Mackeldey, and he remained there throughout the winter. He returned to England well acquainted with the writings of some of the most eminent of the continental jurists. His lectures were well received by a few distinguished men; but the subject was not recognised as a necessary branch of legal study, and evidently did not supply that kind of knowledge best calculated to promote practical success in the legal professions. A. believed the position of a German professor of law to be the most enviable in the world; and with a small but sure income, he would have devoted his great powers to the exclusive cultivation of the subjects discussed in his lectures. But, unfortunately, no provision was made for the Chair of Jurisprudence beyond class fees, and in the absence of students A., in 1832, was reluctantly compelled to resign his appointment. In the same year, he published his *Province of Jurisprudence Determined*, a work, at the time, little appreciated by the general public, and the small success it met did not encourage him to undertake other publications on the allied subjects. In the estimation of competent judges, however, it placed its author in the highest rank among writers on jurisprudence. In 1833, he was appointed by Lord Brougham a member of the Criminal Law Commission. The post was not much to his taste, as he did not believe that the public received any advantage from such bodies, in the efficacy of which for constructive purposes he put no faith. 'If they would give me £200 a year,' he said, 'for two years, I would shut myself up in a garret, and at the end of that time I would produce a complete map of the whole field of crime and a draft of a criminal code.' These, he thought, a commission might with some profit revise and amend. A. was afterwards appointed a member of a commission to inquire into the grievances of the Maltese. He returned to England in 1838, not in good health, and was advised to try the springs at Carlsbad. During his stay in Bonn he had been delighted with the respect the Germans manifest for knowledge, their freedom of thought, and the simplicity of their habits. With his slender means, decent existence in England was scarcely possible, and he removed with his family to Germany, living at Carlsbad in summer, at Dresden and Berlin in winter. The revolution of 1848 drove him back to England, and he then settled at Weybridge, where he died in December 1859, universally respected for the dignity and magnanimity of his character. His lectures on the principles of jurisprudence had remained in manuscript and imperfect. Since his death they have been prepared for the press by his widow, and published between 1861 and 1863, under the title of *Lectures on Jurisprudence, being a Sequel to 'The Province of Jurisprudence Determined,' &c.* On this work his fame now rests.

A.'s great merit consists in his having been the first English writer who attached precise and intelligible meaning to the terms which denote the leading conceptions underlying all systems of jurisprudence. With a very perfect knowledge of the methods of Roman and English law, he displayed genius of the highest order in devising a novel system of classification for the subject-matter of his science. The work he did is incomplete, but it forms a sure foundation to future labourers in the same field. It is universally recognised as an enduring monument of learning and genius, and it entitles its

author to take rank with Hobbes and Bentham, as one of the three Englishmen who have made contributions of importance to the philosophical study of law. A. said of himself that his special vocation was that of 'untying knots'—intellectual knots; and it was so. He set himself to the task of exposing the errors hid under the phrases and metaphors current among writers on law, and thus he accomplished with such skill and subtlety as to make his works models of close and sound reasoning. In education, they now perform a most important part—that of disciplining the mind of those who devote themselves to the study of law and of the mental sciences generally in the difficult art of precise thought; and in this way they exercise an influence it is scarcely possible to over-estimate on the rising generation of lawyers, publicists, and statesmen.—See Memoir of A. prefixed to the *Lectures on Jurisprudence*, and an article on A. in J. S. Mill's *Dissertations and Discussions*.

AUSTIN, Mrs SARAH, wife of the preceding, is well known as the translator of many of the best contemporary French and German works. She belonged to the Taylors of Norwich, a family remarkable for the men and women it has produced distinguished by literary and scientific ability. A faithful and devoted wife, she spent a great many years with her husband abroad, and she enjoyed the friendship of many of the most eminent persons in continental society. Mrs A. translated from the German, *Characteristics of Goethe*, by Falk, &c., with notes (1833); *Fragments from the German Prose Writers*, with notes (1841); and *The Story without an End*, by F. W. Carove (several editions). She also translated from the German, Ranke's *Popes of Rome* and his *History of Germany during the Reformation*. Such is the excellence of these works, that they have been commended by the best judges as deserving to retain a place in English historical literature. Mrs A. translated from the French M. Cousin's *Report on Public Education in Prussia* (1834), and M. Guizot's work on *The English Revolution* (1850). She published in 1839 a work on *National Education*; and in 1857, *Letters on Girls' Schools and on the Training of Working-women*. From 1861 to 1863, she was engaged in editing her husband's lectures from his manuscripts, a duty she discharged with very great ability. She died at Weybridge, on the 8th of August 1867.

AUSTRALIAN EXPLORATIONS. Since the article AUSTRALIA was written, additional information collected by the various exploring expeditions which have repeatedly traversed this island continent, has largely modified the character there given of its interior. The expedition of Sturt from South Australia to the centre of the country in 1845, dispelled the notion of a great inland sea, but it substituted the much less hopeful one of a vast and burning lifeless waste; and this opinion appeared to be corroborated by the fate of the gallant Leichhardt, who, after his successful overland journey from New South Wales to Port Essington in North Australia, started in 1847 to traverse the island from Queensland to Western Australia, and was never more heard of. It was for a time universally considered as decided, that a million of square miles in the interior was hopelessly barren, and in consequence, further explorations were abandoned. However, in 1858, John M'Donald Stuart, a companion of Sturt in his travels, having made a short expedition to the north-west of the colony of South Australia, brought back the cheering news, that a very extensive tract suitable for colonisation existed in that quarter, well supplied with lakes and running 'creeks,' and presenting millions of acres of

excellent pasture. Despite, therefore, the arrival of Gregory in the same year from the north-east of the colony with additional unfavourable reports, Stuart resolved to resume once more the exploration of the interior from south to north; and starting from South Australia in 1860, he held a generally north-by-west course, till his further progress was stopped by the threatening aspect of the natives, at a point in lat. 18° 17' S., long. 134° E. Returning with his two companions to organise a stronger force, he retraced his steps (1861) on the previous track; but after travelling 100 miles further than before, was baffled by an impenetrable scrub, through which he in vain sought a passage. Want of provisions forced him to return a second time; but nothing daunted, he started once more in 1862, along the now familiar path, and on July 24th of that year stood on the shore of the Indian Ocean at Van Diemen's Gulf. Mr Waterhouse, the naturalist, who accompanied Stuart in his third expedition, divides the country passed through into three regions: the first, extending as far north as lat. 27° 18' S., is watered by springs, and is suitable for pastoral purposes, though subject to great heat and drought in summer. The springs either issue from the surface of the plains, or from the tops of curious conical eminences evidently of volcanic origin; these eminences varying from the size of a beehive to a considerable hill. The second region, extending northwards to lat. 17° 36' S., is much more defective in water-supply, and its vegetation chiefly consists of a pungent-flavoured coarse grass, known as 'porcupine grass' (otherwise *Spinifex* or *Triodia pungens*), good pasture being only found in the hollows of creeks. This region also presents several ranges of hills of low elevation, the maximum height being 2000 feet above the plain. The third region, which extends from lat. 17° 36' S. to the sea-coast, possesses a rich soil, sometimes lacustrine, and sometimes alluvial, clothed with the usual abundance of tropical vegetation, and well timbered.

The resumption of the exploration of interior Australia by Stuart had the effect of arousing general attention to the subject in the other colonies; and accordingly, while Stuart was on his 1860 expedition, the colony of Victoria was fitting out another party for the same purpose. This expedition, which was put under the command of R. O'Hara Burke, consisted of a large party with a number of camels (which had a short time previously been imported by the Victorian government from India), and left Melbourne on August 20, 1860, reaching Cooper's Creek in the middle of December. Finding that his company was too numerous, and too much encumbered, Burke left the greater portion at the creek under Brahe, to await his return, and with his second in command, William John Wills, and two others, Gray and King, started, with 6 camels, 1 horse, and 12 weeks' provisions, in a northerly direction, reaching the mouth of the Flinders River, at the head of the Gulf of Carpentaria, on February 11, 1861, being the first explorers who crossed Australia from sea to sea. Unable, however, to obtain a view of the ocean, on account of the extensive marshes which skirt the coast-line, they commenced their return journey, and arriving at Cooper's Creek on April 21, found, to their astonishment, the camp completely deserted. From indications marked on a tree close by, they were induced to dig at its foot, and found a small supply of provisions, and a note to the effect that the party in waiting had left Cooper's Creek to return home; the note being dated April 21, the very day on which the exhausted explorers reached the camp, and having been only seven hours written

when read by Burke. In their worn-out condition, it was a hopeless task to think of following this fresh party to the river Darling through 400 miles of desert, though, had they done so, they would have met Brahe returning with a third section of the expedition, which he had met at the Darling, and led back to Cooper's Creek, reaching it on May 8, but retracing the road to the Darling, on finding (after a very slight examination) no signs of Burke's party having arrived there; so Burke, resolving to gain the nearest pastoral station of South Australia, 150 miles distant, the three travellers (Gray had already succumbed to fatigue and famine) pursued this new route at the rate of 4—5 miles per day, till want of water compelled them to return to the Cooper, though, had they known that the station they sought was not more than 50 (instead of, as they thought, 100) miles off, they might by a strong effort have reached it, and been saved. Instead of this, they returned to Cooper's Creek; and their camels being now all dead, and their provisions nearly exhausted, they resolved, as a last resource, to seek out some camp of natives, where they might remain till assistance reached them from the colony. But their limbs were growing feebler and feebler; at last, on June 28, Wills lay down to die, requesting the others to go on; and on June 30, Burke also succumbed. King, the sole survivor, succeeded in reaching the natives, with whom he lived for 2½ months, till a party under Howitt, which was sent out from Victoria in quest of Burke and Wills, arrived at the creek, and rescued him. Burke's experiences of the interior are, as far as we can gather from the scanty records, equally favourable with those of Stuart. He found some good grassy country north of the Cooper, then passed through a sandy and stony district; but from the tropic of Capricorn to the sea, a large proportion was richly clad with verdure and well watered, with now and then a range of hills traversing it.

The unaccounted-for absence of Burke and Wills produced much excitement in the two southern colonies, and gave birth to three separate expeditions, with the view of bringing aid to the missing explorers. Two of these were fitted out by Victoria, and one by South Australia. The former two were intended to act in concert, and were sent round from Melbourne to Rockhampton, in Queensland, in the *Firefly* of 200 tons. At Rockhampton, Walker and his party were landed, in order to make the Gulf of Carpentaria overland, while the brig pursued her voyage to the head of the gulf, and landed Landsborough and his party at the mouth of the river Albert, in the middle of October 1861. On the 17th, Landsborough commenced his march, and following out his instructions to make for Stuart's 'central' mount, followed up the Albert and Gregory rivers, and thence diverging more to the west, found that the water-supply had wholly failed. Turning then southwards along the river Herbert, his small party of three whites and two aborigines in all were compelled to stop in lat. 20° 11½' S. by the menacing attitude of the natives, and returned to their dépôt on the Albert, which they reached on January 19, 1862. Here they learned that Walker had arrived on December 7, bringing the important news that he had found traces of Burke's party on the Flinders; and Landsborough accordingly resolved to penetrate in an easterly direction. On reaching the Flinders, he found all traces obliterated by the rains, but notwithstanding ascended the river for 280 miles, then crossed to the Thompson, followed it up for the greater part of its course, afterwards striking out eastwards to the Barcoo or Cooper, and failing to reach Cooper's Creek on account of the extreme drought, made for the

settlements on the Darling, and arrived at Melbourne in August 1862. Landsborough found the country between the gulf and the Thompson to consist of good soil thickly grassed; and, with rare exceptions, water was generally abundant.

The South Australian expedition was got up on a much larger scale, consisting of 8 men, 4 camels, 26 horses, 12 bullocks, and 100 sheep, and was put under the command of M'Kinlay, an experienced explorer. It started from Adelaide on August 16, 1861, and on September 24, had passed the furthest settlements of the colony; crossed the formerly mysterious Lake Torrens, which was at that time a dry desert; and came into a district abounding with lakes and creeks, and luxuriantly clad with grass whenever the rain afforded support to animal life. Here it was learned that the fate of Burke and Wills had been ascertained, and the party then held northwards for the Gulf of Carpentaria. Leaving the lake district, they entered the Great Desert, whose inhospitable nature had been so vividly described by Sturt sixteen years before; but curiously enough, in a district in which Sturt had almost perished of thirst, M'Kinlay's party were almost carried away by a flood. In lat. 25° S., they emerged on an extensive country, abounding in grassy plains, watered by rivers, and intersected by hill ranges; and in lat. 22° S. they entered upon a country of tropical character, reaching the Leichhardt, which they followed down till the deep and broad mangrove creeks and boggy flats which form a wide border round the beach of the gulf, hindered their further progress; so that, like all the preceding explorers, with the exception of Stuart, a glimpse of the ocean was denied them. From the Leichhardt River they then proceeded in an east-by-south course, reaching Bowen at Port Denison, in Queensland, in the beginning of August 1862, and thence reached Adelaide by sea.

The results of these explorations of interior Australia agree in this, that there is a much larger extent of territory available for colonisation than was formerly believed; that, in fact, by far the greater portion of the interior is more or less suitable for colonisation, and that only to that portion of it lying in the centre in lat. 27°—25° S. can the term desert be with justice permanently applied. Yet Sturt's desert was certainly no fancy, and his route to the centre of the interior was through a barren waterless waste, while M'Kinlay, who followed nearly the same track, was delighted with abundance of rich pasture and water. The truth seems to lie between the two extremes; Sturt's expedition was carried out during a year of unusual drought, while the recent expeditions here sketched took place during exceedingly moist seasons, the year 1861—1862 being the wettest the colonists of Victoria had ever known. Consequently, we should err in supposing the interior to be a mere desert on the one hand, or a blooming, well-watered expanse on the other. It is in reality a surface covered with soil more or less fertile; the basaltic rocks and clays being the most, and the quartz, sandstone, and granite least fertile; and the rainfall is sufficient, in ordinary seasons, to revive the dormant germs of vegetable life, and cover the surface with a crop of grass more or less luxuriant. On the other hand, the occasionally long continuance of drought, accompanied with an excessive amount of evaporation, wholly dries up some streams, converts others into a series of pools, connected by threads of water, or 'creeks,' reduces extensive lakes to marshes or to shallow pools, in which the concentration of the soluble salts of the soil renders the water so brackish as to be wholly undrinkable, and restores the verdant surface for a time to the

condition of a desert, herbage remaining only on the banks of creeks. The rainfall, which is the sole water-supply in the central districts, does not occur at regular intervals, but there is every reason to suppose that the excessive drought experienced by Sturt has not reappeared since 1845. Occasionally, the fall of rain is so excessive as to convert the whole of a plain, as far as the eye can reach, into a shallow sea, which, however, soon disappears by the drainage of the rivers and creeks, or under the influence of the excessive evaporation, and in an almost incredibly short period thereafter, the ground is clothed with verdure. The climate of the northern districts is very different; there we have a temperature even higher, but its effect on vegetation is rendered very favourable by the frequent and moderate rains; and this region is well suited for colonisation.

Up to the present time, the western half of Central Australia has not been explored.

These expeditions have also contributed a few facts respecting the rivers of North Australia. The Flinders, which was explored by Landsborough to 380 miles above its source, was estimated by him to be fully 500 miles, and the Albert 100 miles long; the Roper was found by Stuart to be a deep wide river at about 100 miles from its mouth; and, on the whole, the river-system of North Australia is considerably more extensive than was formerly supposed.

In 1865, an expedition under the command of M'Intyre, an experienced explorer, was fitted out for the purpose of searching for evidence as to the fate of Leichhardt and his party, but it could not advance further than Cooper's Creek. However, in the end of 1866, another expedition was being organised for the same object, and though its results are not yet known, hopes are entertained of its success.

M'Kinlay's exploratory tour in Northern Australia in the middle of 1866 also failed, his party, as in his previous celebrated march across Australia, having been nearly carried away by a sudden flood.

A new colony is (1867) to be founded at Port Anson in Arnhem's Land, in lat. 13° 30' S., long. 130°.

AUXERRE (anc. *Autissiodorum*), chief town of the dep. of Yonne, France, stands on the Yonne, 90 miles south-east from Paris, with which it is connected by railway. It is situated on the slope of a hill, in a rich and beautiful district abounding in vineyards; but the city itself is generally ill built, the streets narrow, crooked, and dirty. Its aspect from a distance is very imposing, the most prominent feature being the cathedral, a grand and beautiful edifice. It is dedicated to St Stephen, and although part of it is as old as the 13th c., it is not yet completed. The greater part of it is in the Flamboyant style, but the choir is in the Early Gothic. The painted glass of the windows is very splendid. The chapter of A. was at one time one of the richest in France. The church of St Germain is another fine building, with a lofty choir and transepts, and a very ancient detached tower. It contains crypts in which are the tombs of the early counts of Auxerre. The church of St Pierre is a beautiful specimen of the Italianised Gothic, built in the 16th and 17th centuries. There is a curious old clock-tower over a gate-house, with an ugly skeleton spire of iron bars. The ancient walls of the city have been converted into boulevards. A. was a flourishing town before the Roman invasion of Gaul. It successfully resisted the Huns under Attila, who only ravaged its suburbs. Clovis took it from the Romans. After his death, it became part of the kingdom of Burgundy. The English took it in 1359, but it was retaken by Du Guesclin. Charles VII. gave it up to the Duke of Burgundy. It was finally united to the kingdom of France by

Louis XI. It has a communal college, a museum of antiquities, and a botanic garden. The principal manufactures are of strings for musical instruments, woollen cloths, hosiery, earthenware, and leather. The Yonne becomes navigable here, and large quantities of Burgundy wines are sent down it to Paris; there is also a considerable export trade in timber and in charcoal. Pop. (1866) 13,062.

AVALLON (anc. *Aballo*), a town of the dep. of Yonne, France, 26 miles south-east from Auxerre, on a steep hill of red granite, nearly surrounded by the Cousin, which here flows through a ravine. Around the town runs a broad terrace-walk, shaded with lime-trees, about 500 feet above the bed of the river. The surrounding country is fertile, yielding much wine and grain, and abounding also in excellent pastures, on which great numbers of cattle and sheep are fed. The town is generally well built, and has broad and clean streets. The church is ancient, and has a curious Romanesque portal. Manufactures of various kinds are actively carried on, particularly of woollens and paper; and there are distilleries, tanneries, glass-works, &c. There is also a considerable trade in the produce of the neighbourhood. A. is a very ancient town, of Celtic origin. It was sacked by the Saracens in 731 A.D., and by the Normans in 843; taken by Charles VII. in 1433, retaken by Philip the Good, Duke of Burgundy, in 1455; and pillaged by the troops of the League in 1593. Pop. (1866) 4916.

AVEIRO (anc. *Aveium*), a city of Portugal, in the province of Beira, 31 miles north-west from Coimbra. It is situated on the Ria d'Aveiro, a salt lake or lagoon, extending five leagues to the north, and separated from the sea by a narrow bar of sand. Into this lake the Vouga, the Antua, and some smaller rivers flow. During a year of great drought, the sand-bar closed up the seaward opening, a vast mass of sand quickly accumulated, and the low grounds were inundated, the water of the rivers escaping only by filtering through the sand. In summer, the lake thus made is partially dried, and marshes are formed, the effluvia from which have rendered the city very unhealthy, so that its population has fallen from 14,000 to 5000, its present number. In 1808, the government opened a new passage through the sand-bar, and executed other works which dried part of the inundated grounds, and improved the sanitary conditions of the city, which, however, are far from being good. A. is a bishop's see, but its cathedral is 'a squalid and tawdry room, up one pair of stairs.' It is a place of considerable activity; it has manufactures of earthenware, but the chief article of trade is salt, which is made in the marshes in summer. Other important articles of trade are fish, wine, oil, and oranges. The anchovy, sardine, herring, and oyster fisheries are actively prosecuted. The city has a deserted appearance. Its streets are narrow and dark, and seamed with filthy canals of salt-water.

AVE'LLA (anc. *Abella*), a town of Central Italy, in the province of Avellino, 20 miles east-north-east from Naples. It is delightfully situated in a hilly district, and commands a very extensive view. A ruined castle marks the site of the ancient city, which was founded by one of the Greek colonies from Chalcis, and was celebrated in Roman times for its apples and pomegranates. Virgil speaks of it as *malifera Abella*. Pop. of commune (1861) 5228.

AVEZZA'NO, a town of South Italy, in the province of Aquila, 22 miles south from Aquila. It is situated in a beautiful and fertile plain, covered with almond trees and vineyards, about a mile from Lake Fucino. It has a large square, in which is a palace of the Colonna family. The town belongs to

the Barberini family, whose baronial castle is a conspicuous object from the shores of the lake. The castle and some of the churches contain numerous ancient marbles with inscriptions recovered from the lake. The present town is about two miles distant from the site of Alba, the city of the Marsi, celebrated in the history of the Roman Republic, which occupied the crest of a hill; a small village on the site still retains the name of Alba. Pop. (1861) 4444.

AVIGLIA'NO, a town of South Italy, in the province of Basilicata, ten miles north-west from Potenza, on one of the head-waters of the Sele, near the bifurcation of the Apennines. It stands on the brow of a hill, part of which gave way, after long-continued rains in 1824, carrying with it a portion of the town. A. has an elegant collegiate church. The pastures of the neighbourhood are celebrated for their large and fine oxen. Pop. (1861) 9236.

AVILE'S (anc. *Flavignavia*), a town of Asturias, Spain, in the province of Oviedo, and 19 miles north-by-west from Oviedo, at the mouth of the chief branch of the Aviles, which is here crossed by a bridge, and is navigable at high water for vessels of the largest size up to the town. It has several good squares, but the streets are irregular and arcaded. There are copper-mines in the vicinity, and a considerable trade is carried on in copper vessels manufactured from their produce, as well as in coal, which is obtained not far from the town. Manufactures of earthenware, glass, linen, &c., are also carried on. A. is one of the cradles of the Spanish monarchy, and contains a number of curious old buildings. The charter granted to the town by Alonso VII. in 1135 is preserved among the public records. Pop. 6000.

AVRANCHES (anc. *Abrancez*), a city of the dep. of Manche, France, near the left bank of the Seez, 33 miles south-south-west from St. Lo. It stands on the sides and summit of a high hill, which extends in a long ridge, and the ascent of which is by zigzag roads on terraces. This hill commands a very wide and beautiful view of a finely wooded and cultivated district, with a winding river, which expands into a broad estuary, at the mouth of which is the high islet peak of Mount St. Michel. A. was formerly a bishop's see, and its cathedral was one of the most magnificent in Normandy, but was totally destroyed by the mob during the Revolution. A stone still preserved on the site of the cathedral is said to be that on which Henry II. of England kneeled before the papal legates to receive absolution for the murder of Becket. Before the Roman conquest of Gaul, A. was the capital of the Abrincatui. It was a place of importance during the Roman period. Charlemagne fortified it, but it was taken by the Normans in 865. It was afterwards a frequent object and scene of strife during the wars between the French and English. It has manufactures of lace, tiles, and bricks, and a little trade in grain, butter, cattle, &c. Pop. (1866) 7756.

AYAMO'NTÉ, a town of Andalusia, Spain, on the left bank of the Guadiana, and near its mouth, where it forms the boundary between Spain and Portugal. It stands on an acclivity. The upper part of the town consists of narrow and irregular streets; those of the lower part are regular and wide. There are three public squares. The principal occupation of the inhabitants is fishing. Boat-building and lace-making were once very extensively carried on, but both have greatly declined. Pop. 8000.

AYO'RA, a town of Spain, in the province of Valencia, and 50 miles south-west from Valencia, on the upper part of a river of the same name, and

situated in an extensive hollow at the base of a limestone mountain. It has four squares and wide streets. On the summit of the hill are the remains of an old castle, close to which the town once stood. The inhabitants are chiefly employed in husbandry and oil-making. Pop. 5412.

AZIMABAD, or **TIROWLI**, a town of Sirhind, India, in 29° 48' N. lat., and 77° E. long., on the route from Kurnal to Lodiana, 9 miles north-west from Kurnal. Its site is slightly elevated above the neighbouring plain, which is inundated in the rainy season. It is surrounded by a high brick wall, pierced with loopholes for musketry, and having bastions surmounted with towers. A large

caravanserai is enclosed with a lofty embattled wall, having a tower at each corner, and surrounded by a deep ditch, capable of being filled with water.

AZU'A, a town of the island of San Domingo, not far from the south coast, on the Bia, and near its mouth, 60 miles west from St Domingo. Pop. 6000.

AZUA'GA, a town of Estremadura, Spain, in the province of Badajos, 20 miles east from Llerena. It is situated in an elevated district, drained by the head-waters of the Matachel, a branch of the Guadiana; the surrounding country produces much grain, is partly covered with extensive oak forests, and contains large tracts of heath, bright in summer with the blossoms of different species of *cistus*. Pop. 6400.

B

ACOLOR, a town of the island of Luzon, Philippines, the capital of the province of Pampanga, 38 miles north-west from Manila. Pop. 8737. It stands in a plain, near the river Pampanga, with which it is connected by a canal.

BA'CUP, a rapidly-increasing and very prosperous town of Lancashire, and station of the East Lancashire Railway, situated in a beautiful valley near the borders of Yorkshire, 15 miles north from Manchester, and 12 miles east-by-south from Blackburn. Great improvements have been and are still being made in the condition and appearance of the town. There are many churches of all denominations, a mechanics' and a literary institute, reading-rooms, &c., and in August 1867 was opened a beautiful market-house. The pop. was 6981 in 1851, and 10,935 in 1861. B. has extensive cotton-factories, dye-works, brass and iron foundries. There are numerous coal-mines in the neighbourhood; and within a mile from the town, large woollen manufactories.

BADARKA, a town of Oude, India, in the district of Bainswarra, four miles east from the Ganges, and five miles east from Cawnpore. Pop. 8000, of whom only 50 are Mussulmans.

BAGARIA, or **BAGHERIA**, a town of Sicily, in the province of Palermo, nine miles east-by-south from Palermo, with which it is connected by railway. Pop. (1861) 11,762. It is beautifully situated at the base of the isthmus which separates the Bay of Palermo from that of Termini, and is surrounded by groups of palatial villas of the Sicilian nobility, abandoned after the proprietors had ruined themselves by the festivals here celebrated in honour of Queen Caroline, at the commencement of the present century.

BAGNA-CAVALLO, an inland town of Italy, formerly belonging to the Papal States, 11 miles west from Ravenna, in the province of that name. Pop. (1861) 3865. B. was a Roman city, called Tiberiacum, in honour of Tiberius. The present town is walled, and was formerly famous for its strong castle. It has a cathedral, dedicated to St Michael the Archangel. It is connected by a canal with the Po di Primaro.

BA'GNI DI LU'CCA (*Baths of Lucca*), a large inland village of Italy, in the province of Lucca, and 13 miles north from the city of Lucca. Pop. of commune (1861) 8238. It is one of the most frequented bathing-places in Italy, and is situated in

one of the finest valleys of Tuscany, the valley of the river Lima, a branch of the Serchio. There are hot springs of various temperature from 96° to 136° Fahr., scattered over a limited neighbourhood. Their waters contain sulphate of lime, sulphate of magnesia, muriate of magnesia, and other salts. The rock from which they issue is a Tertiary sandstone. Great part of the population of Bagni di Lucca consists of English and other visitors. Gambling was at one time carried on here to a great extent, but was suppressed in 1846.

BAGNO A RIPOLI, a famous Italian bathing-place, in the province and circle of Florence, five miles east-north-east from the city of Florence.

BAGNO IN ROMAGNO, a town of Italy, in the province of Florence, and 35 miles east-by-north from Florence city, on the right bank of the Savio, not far from its source. It is a much frequented bathing-place, having hot springs of temperature 108°—110° Fahr. It has a fine old church, and another magnificent old building used as a bathing establishment. The neighbourhood is fertile, particularly on the banks of the river; the mountains are clothed with forests of pine, chestnut, beech, and oak, on the fruit of which swine are fed.

BAGNOLO, a town of Piedmont, in the province of Cuneo, 12 miles north-west from Saluzzo, on the left bank of the Grana, at the foot of the Alps.—Another small town near Brescia bears this name; also a town in the province of Reggio, in Emilia; and a town of the province of Lecce, in South Italy, as well as many villages in Italy.

BAHA'R, or **BEHAR**, a town of Bengal, 34 miles south-east-by-south from Patna, the chief town of a British district of the same name (see **BAHAR**). It had, upwards of 50 years ago, a pop. of nearly 30,000, but is now a decayed town, the original city being indeed nearly deserted, and the present town consisting of houses scattered about its remains, and interspersed with fields, gardens, and groves. There are some remains of fine mosques. The ruin of this town began with its sack by the Mahrattas about 1742, and was completed by a famine some years after.—The present district of Bahar is but a small portion of the great province which was called by that name in the empire of Delhi.

BAILEY, SAMUEL, a writer on politics, political economy, mental philosophy, and other subjects, was born in 1791 in Sheffield, where he received his

education, and has continued to reside. He was by occupation a banker, but is understood to be now retired from business. His works are: *Essays on the Pursuit of Truth and on the Progress of Knowledge* (1821); *Questions for Discussion in Politics, Political Economy, and other Departments of Knowledge* (1823); *A Critical Dissertation on the Nature, Measures, and Causes of Value* (1825); *A Letter to a Political Economist, occasioned by an Article in the Westminster Review on the Subject of Value* (1826); *Essays on the Formation and Publication of Opinions* (1829)—a sequel to his work on the *Pursuit of Truth*; *A Discussion of Parliamentary Reform* (1831); *The Rationale of Political Representation* (1835); *The Right of Primogeniture Examined* (1837); *Money and its Vicissitudes in Value* (1837); *A Defence of Joint-stock Banks and Country Issues* (1840); *A Review of Berkeley's Theory of Vision* (1842); *A Letter to a Philosopher in Reply to some Recent Attempts to vindicate Berkeley's Theory of Vision* (1843); *The Theory of Reasoning* (1851); *Discourses on Various Subjects, Literary and Philosophical* (1852); *Letters on the Philosophy of the Human Mind* (three series, 1855, 1858, 1863); *On the Received Text of Shakespeare's Dramatic Writings, and its Improvement* (2 vols. 1862, 1866).

Mr B.'s works on the *Pursuit of Truth* and the *Publication of Opinions* gave a great impetus to liberal and advanced views. His writings generally are distinguished by independent thinking, logical precision, a careful English style, and warm aspirations for the improvement of mankind. His treatises on the mind, while abounding in original suggestions, expand and enforce the views of the school of Locke in metaphysics, and what is termed the doctrine of Utility in morals.

BAILMENT, an English law term, defined to be 'a delivery of goods for a particular purpose, upon a contract, express or implied, that the purpose shall be carried into effect, and that, when that is done, the goods shall be restored by the bailee, or person to whom they are delivered, to the owner or bailor, or according to its directions.'—*Tomlin's Dict.*

BAIN, ALEXANDER, writer on mental philosophy, was born at Aberdeen in 1818. He entered Marischal College and University in 1836, and graduated in 1840. From 1841 to 1844, he assisted the Professor of Moral Philosophy in Marischal College, and in 1844—1845, taught the class of Natural Philosophy. In the winter of 1845—1846, he lectured on Natural Philosophy in the Andersonian University, Glasgow. In 1847, he became Assistant-secretary to the Metropolitan Sanitary Committee, and was thence transferred to the same office in the General Board of Health, which office he resigned in 1850. In 1857, he was first appointed Examiner in Logic and Moral Philosophy in the university of London. For several years, he acted as Examiner in Mental Philosophy at the competition for the India Civil Service. In 1860, he became Professor of Logic in the university of Aberdeen.

Mr B. began as a writer in 1840, by contributing to the *Westminster Review*. He also contributed a considerable number of treatises to the publications of W. and R. Chambers, especially in the educational department; among them was an edition of the *Moral Philosophy of Paley, with Dissertations and Notes* (1852). In 1855, he brought out *The Senses and the Intellect*, and in 1859, *The Emotions and the Will*, completing a system of the human mind. In 1861, appeared *The Study of Character, including an Examination of Phrenology*. In 1863, he published an *English Grammar*, and in 1866, a *Manual of English Composition and Rhetoric*.

As a thinker and writer, B. is remarkable for the subtlety and minuteness of his analysis and the clearness of his exposition. He belongs decidedly to the empirical or experimental school of philosophy, in opposition to the *a priori*, or transcendental. His chief work, *The Senses and the Intellect*, together with *The Emotions and the Will*, is the most complete systematic exposition of the phenomena of the human mind in the English, or perhaps in any language. B.'s psychology is based on physiology, after the manner of Hartley's; but instead of considering the human organism as capable only of receiving impressions and of acting in response thereto, he finds in it a power of originating active impulses (see SPONTANEITY), and thus obviates many of the defects alleged by *a priori* philosophers to inhere in the system of sensationalism, as hitherto exhibited.

BAITOO'L, or **BEITOO'L**, a fortified town of British India, in the presidency of Bengal, and territory of Saugor and Nerbudda, 50 miles north-east from Ellichpoor. It is the capital of a *pergunnah*, which has an area of 990 sq. m., and a pop. of 93,441. It is situated on the small river Machna, a tributary of the Towa, in a pleasant valley at the south base of the Satpoora range. B. came into the possession of the British in 1818.

BA'JMAK, a large village of the Austrian Empire, in Upper Bacs, in the Servian *Woivodschaf*, 16 miles south-west of Theresienstadt. Pop. 5610.

BAKER, SIR SAMUEL WHITE, K.B., an African traveller, was born in 1821. He is the son of Mr Samuel Baker, of Thorngrove, in Worcestershire. B. was educated as an engineer, and at an early age, went to Ceylon. There, led by the love of field-sports into the recesses of the island, he gave evidence of that love of adventure which was to make him famous as an explorer. In 1854, he published a work entitled *The Rifle and the Hound in Ceylon*; and in 1855, *Eight Years' Wanderings in Ceylon*. B. afterwards superintended the construction of the railway which connects the Danube across the Dobrudscha with the Black Sea. In 1860, B. married Florence, the daughter of F. von Sass, a young Hungarian lady of great talent and enterprise; and in company with her, he undertook a journey of exploration on the Upper Nile. They set out from Cairo in April 1861; and B. devoted his attention first to the Atbara and Blue Nile, the chief affluents of the Nile, which descend from the highlands of Abyssinia. In June, he arrived at the course of the Atbara, which was at that season dry, or marked only by a few stagnant pools. On the 23d, when the Abyssinian rainy season had set in, a noise like distant thunder was heard, and in a few seconds the river-bed had been converted into a torrent 20 feet deep. Eight days later, it had become a great river, charged with mud, washed from the hills, which it carried down to the Nile, to cause the inundations and mud deposits of Egypt. B. reached Khartoum in June 1862, and there he had an opportunity of contrasting the Blue and White Nile. He found the former, like the Atbara, to be a mountain torrent, rising and falling with the Abyssinian rains, but always free from deposits of mud. The White Nile did not thus rise and fall, and its water, never pure, had a disagreeable taste of vegetation, shewing that it proceeded from lakes and marshes. When B., with his wife, quitted Khartoum to ascend the White Nile, he had in his pay an escort of 90 persons, 29 camels and asses, and three large boats. After passing through a wonderful region of forests and marshes, the travellers reached Gondokoro, a rendezvous of the

BALAGHAT DISTRICTS—BANSWARRA.

ivory-merchants or slave-dealers from the Lower Nile, and the traders of the interior. They had only been there a fortnight, when they were joined by Speke and Grant, who had penetrated into those regions from the south, and whom they were able to relieve when much in need of assistance. Speke and Grant told B. of the Victoria N'yanza, which they had just discovered and explored, and that the natives had described to them another great lake, named Luta Nzige, which they had been unable to visit. B. resolved, if possible, to reach this lake. With an escort reduced to 17, he and his wife again set out; and after a series of adventures, in which Mrs B. exhibited unparalleled tact and daring, they arrived, on 14th March 1864, on the top of lofty cliffs, from which they beheld a vast inland sea, the third of the great African lakes, and the equal of the Victoria N'yanza. To it B. gave the name of the Albert N'yanza. In 1864, B. had awarded to him, for his relief of Speke and Grant, the patron's medal of the Geographical Society; and in 1865, as a reward for his discoveries, he received the honour of knighthood. In 1866, he published *The Albert N'yanza, Great Basin of the Nile, and Explorations of the Nile Sources*.

BALAGHAT DISTRICTS, the name given to a large tract of elevated country in the south of India, 28,669 sq. m. in area, and extending from the rivers Tumbuddra and Krishna in the north to the furthest extremity of Mysore in the south. It includes Mysore, and the districts of Bellary, Cuddapah, and Kurnul. It was part of the ancient Hindu kingdom of Bijyanagar, or Carnata, was conquered by the Mohammedans, and fell into the hands of the British on the final overthrow of Tipoo (q. v.). The name Balaghat signifies *Above the Ghatis*.

BALASINORE, or **BALASINESHWAR**, a petty native state, or *jaghire*, of India, in the province of Guzerat, protected by the British government, and politically connected with the presidency of Bombay. It extends from N. lat. 22° 53' to 23° 17', and from E. long. 73° 17' to 73° 40', and contains an area of about 258 sq. miles. The river Mahi flows through the jaghire. The native ruler is styled Nawab of Balasinore. He has a revenue of 41,548 rupees, of which he pays 10,000 rupees as tribute to the British government. The pop. of B. is estimated at 19,092. The Nawab maintains a force of only 8 horsemen and 50 foot-soldiers, who are employed in revenue, police, and other services.—The capital of the jaghire also bears the name of Balasinore. It is rather a thriving town, and is surrounded by a wall. It is 51 miles north from Baroda.

BALOTRA, a town of India, in the Rajpoot state of Joudpore, 59 miles south-west of the city of Joudpore. It is situated on the right bank of the river Loonee. Being on the high-road from Joudpore to Dwarka, a celebrated place of pilgrimage in the west of Guzerat, it is a great resort of pilgrims, with whom its bazaar is often crowded. Many of the inhabitants of the town subsist by providing for their wants. The town is supplied with good water from 125 wells, lined with masonry. Pop. 7275.

BAMPURA, **BHAMPURA**, or **BHANPURA**, a town of Hindustan, in the territory of Indore, on the Bawa, 1344 feet above the level of the sea, about 180 miles south-west of Gwalior. It is situated at the base of a range of hills, is surrounded by a wall, and has an unfinished fort, built of stone, which encloses an unfinished palace. Both palace and fort were begun by Jeswunt Row Holkar, of whom there is a beautiful marble statue in the palace. B. is the principal place of a pergunnah containing 70 villages. Pop. 20,000.

BANAS, or **BUNAS**, the name of three rivers of India.—1. A river of Rajpootana, rising on the western frontier of Mewar, in the Aravulli Mountains, about N. lat. 24° 47', E. long. 73° 28'. Flowing through Mewar for 120 miles, in a generally north-eastern direction, receiving the Beris, or Beruch, on the right, and the Botasari on the left, it passes the town of Tonk, where it changes its course to the south-east, and falls into the Chumbul in N. lat. 25° 54', E. long. 76° 50', after a total course of 320 miles.—2. A river which also rises in the Aravulli Mountains, and after a south-westward course of 180 miles, is lost in the Runn of Cutch, terminating in a number of small and intricate channels.—3. A river of Rewah, in Bundelcund, having a north-westward course of about 70 miles, and falling into the Sone near Rampur.

BANAWARAM, a town of India, in the territory of Mysore, in a fine open country, among the head-waters of the Hugri, 81 miles north-west from Mysore. It is a town of some antiquity. It was taken in 1694, in a night-assault by Chika Deo, Rajah of Mysore. When it had fallen under the dominion of Hyder Ali, the inhabitants were in great part removed to Nagapuri, a new town which Hyder had founded in the vicinity. Previous to this removal, the pop. was about 10,000. The new town proving extremely unhealthy, the survivors of the people of B. were permitted to return to their old habitations.

BANDAJAN, a pass over the Himalaya, forming the southern boundary of Kunawar. It is amidst mountains of gneiss, and is covered with perpetual snow. The summit of the pass is 14,854 feet above the sea, and is in N. lat. 31° 22', E. long. 78° 4'.

BANDON, or **BANDONBRIDGE**, a town of the county of Cork, Ireland, on the Bandon, 12 miles south-west from Cork, with which it is connected by a railway. The houses are built of stone. There are several good streets, and numerous ecclesiastical and other public buildings. B. was originally peopled by a colony of English Protestants, and was so strictly Protestant, that till about the beginning of the present century, no Roman Catholic would have been allowed to settle in it. More than three-fourths of the population are now Roman Catholics, and there is a Roman Catholic convent. B. was at one time a prosperous manufacturing town, cotton-spinning and weaving being extensively carried on; but these branches of industry have been almost entirely relinquished, and the pop., which was 9049 in 1841, had diminished to 6243 in 1861. It returns one member to the House of Commons. The country around B. is very beautiful, well wooded, undulating, and pastoral. The river Bandon rises in the Carberry Mountains, and at its mouth forms the harbour of Kinsale. Spenser describes it as 'the pleasant Bandon, crowned by many a wood.' It has a course of 40 miles, for 15 of which it is navigable, to Innishannon, 4 miles below Bandon.

BANJOEMA'S, a town of Java, 22 miles from the south coast, in S. lat. 7° 33', and E. long. 109° 20'. It is situated at the opening of an extensive and very fruitful valley. It is tolerably well built, and carries on a considerable trade. Pop. 9000. B. is the residence of a Dutch governor, and has a fort and garrison. It is the capital of a province of the same name, which is one of the richest and most productive in Java.

BANSWARRA, a Rajpoot state in the west of Malwa, bordering on Guzerat. It extends from N. lat. 23° 10' to 23° 48', and from E. long. 74° 2' to 74° 41', and has an area of 1440 sq. miles. The pop. is supposed to be about 144,000. This state was dependent on the empire of Delhi until the

ascendency of the Mahrattas, by whom it was fearfully oppressed. In 1812, the ruler made overtures to the British government, offering to become tributary on condition of protection; and an arrangement to this effect was concluded in 1818.—The capital, also called Banswarra, is on the route from Mhow to Deesa, 123 miles north-west from Mhow. The majority of the inhabitants are Hindus, but the Mussulmans are also pretty numerous. The palace of the Rawul, or chief, is a large, turreted, battlemented building, on a rising ground overlooking the town, near a beautiful tank, overhung with trees.

BARBACENA, a city of Brazil, in the province of Minas Geraes, 150 miles north-west from Rio de Janeiro. It is situated on the top of two hills in the Sierra Mantiqueira, and at an elevation of about 3500 feet above the sea, so that, although within the tropics, it enjoys a mild climate. The streets are broad and straight, the principal ones paved and provided with footpaths. The houses are low, and have gardens behind. The inhabitants are chiefly engaged in gold-mining and in exporting coffee and cotton to Rio de Janeiro. B. is the centre of a productive district, the pop. of which is 12,000.

BARBA'DOES LEG, which seems to be identical with the *Elephantiasis of the Arabs*, is a disease which is characterised by hypertrophy of the skin and of the subcutaneous areolar tissue. Notwithstanding its name, it may affect the arm, female breast, &c. It begins with acute febrile symptoms, and inflammation of the superficial lymphatic vessels. The part swells, and becomes uneasy from tension, the glands being especially large and hard. The skin varies in appearance, being sometimes white and shining, and in other cases of a dark colour, and studded with projecting veins. The swelling is sometimes very great, and quite hard. In some parts of the body, skin which would naturally weigh less than a couple of ounces, is thus converted into a tumour weighing from 100 to 150 lbs. The disease is endemic in the tropics; and in the cases which we see in this country, it always appears that the disease commenced in a hot country.

Iodine is recommended by some doctors, and well-regulated pressure by others. The leg has been amputated, in consequence of the annoyance caused by its great weight; but this should be regarded as an ultimate resource, and ligation of the femoral artery, which often causes great subsidence of the swelling, should be first tried.

BARCELLO'NA AND PO'ZZO DI GO'TTO, two towns of Sicily, in the province of Messina, standing close together, so as really to form one town, the two parts of which are separated by a small stream, the Fiume di Castro Reale, supposed to be the Longanus of antiquity. Pop. (1861) 13,257. The chief street is a long street of mean houses of a single story. B. is situated in a broad plain, between the mountains and the sea, abounding in corn, wine, oil, and fruit. It is 22 miles west-south-west from Messina.

BARCLAY, JOHN, M.D., lecturer on anatomy in Edinburgh, and eminent for his attainments both in human and comparative anatomy, in physiology, and in other branches of natural science, was born December 10, 1758, at Cairn, near Drummaquhance, in Perthshire, Scotland, and was educated at the parish school of Muthil, and afterwards at the university of St Andrews. He studied for the ministry of the Church of Scotland, and was licensed as a preacher, but afterwards devoted himself to the profession of medicine, and particularly to the study of anatomy. He obtained the degree of M.D. from the university of Edinburgh in 1796. After spending a year in London, he became a

private lecturer on Human and Comparative Anatomy in Edinburgh. He published in 1803, *A New Anatomical Nomenclature*; and in 1808, a treatise on the *Muscular Motions of the Human Body*. In 1812, appeared his *Description of the Arteries of the Human Body*, a work of vast labour and accurate observation. In 1825, not long before his death, he published *An Inquiry into the Opinions, Ancient and Modern, concerning Life and Organisation*. He died at Edinburgh on 21st August 1826, leaving to the Royal College of Surgeons in Edinburgh his admirable anatomical collection, for the reception of which a suitable and splendid hall was erected.

BA'ARDI, a small town of Italy, on the left bank of the Ceno, 31 miles west-south-west from Parma, in the province of Piacenza. The town is commanded by a castle, situated on a hill, erected in the 9th century. In the vicinity are noble forests of chestnut, beech, and oak. B. was formerly the capital of the duchy of Bardi.

BA'ARGA, or BARGA DE GARFAGNANA, a town of Italy, in the province of Lucca, 25 miles north-north-east from Pisa, near the left bank of the Serchio. B. has a fine collegiate church, and is celebrated for its gunpowder manufactories. The sides of the neighbouring mountains are covered with noble chestnut forests.

BA'ARGA PASS, in the Himalaya, in N. lat. 31° 16', E. long. 78° 19', the highest part of it about 15,000 feet above the sea.

BA'RKING, a town of the county of Essex, England, in a low flat situation, on the left bank of the Roding, about two miles above its junction with the Thames, and five miles north-east of London, on the North Woolwich Railway. Pop. (1861) 5076, among whom are many fishermen, who pursue their occupation on the Thames, the tide flowing up the Roding to the town. The mouth of the Roding is often called Barking Creek. The neighbourhood sends large quantities of potatoes and vegetables to the London market. There is also a transit trade in coal and timber. The church of St Margaret is an edifice of considerable beauty, in the Perpendicular style, and probably of the beginning of the 15th c.; but it contains three columns of the Early Norman style, supposed to have been brought from the ruins of the adjacent abbey.—*Barking Abbey* was one of the richest nunneries in England. It was founded about 677 A.D., in the reigns of Sebban and Sighere, kings of the East Saxons, by St Erkenwald, Bishop of London, whose sister, St Ethelburga, was the first abbess. In 870, it was burned to the ground by the Danes, and the nuns killed or dispersed. It was rebuilt and restored to its former splendour by King Edgar, in the middle of the 10th century. The Abbess of Barking was one of four ladies who held the rank of baroness in right of their office. She lived in great state, and always furnished a quota of men to the king in time of war. She was required also to maintain certain embankments on the Thames. Several queens of England, and other ladies of very high birth, assumed the office of Abbess of Barking. After the suppression of convents by Henry VIII., the abbey buildings soon went to ruin, and scarcely any remains exist except the gate-house.

BARNES, REV. WILLIAM, poet and philologist, is author of three collections of poems written in the dialect of Dorsetshire, the first entitled *Poems of Rural Life in the Dorset Dialect, with a Dissertation and Glossary* (Lond. 1844); the second, *Humorously Rhymes, &c.* (Lond. 1859); and the third, *Poems of Rural Life, &c.* (Lond. 1862). The first of these collections reached a second edition in 1847, shewing that at least some interest was taken even at

that early period in Mr B.'s 'h'womely rhymes.' They were not critically noticed, however, so far as has been ascertained, until November 1859, when a highly eulogistic review of them appeared in the *North British Review*, pronouncing Mr B. to be 'the best writer of rustic eulogues since Theocritus.' The reviewer also says, speaking of Mr B.'s poetry, 'that it combines in a high degree the special merits of Wordsworth and Burns, but in a way which is so perfectly original, as to bear no trace of even a perusal of those poets by the author.' Such praise, although exaggerated, is not altogether without foundation. Mr B. is a true poet, combining with a genuine love of nature, as seen in the rich grazing-lands of Dorsetshire, a keen sympathy with the rustic population, their hopes and fears, loves, joys, sorrows, and superstitions. It is for this audience that Mr B. professes to write, and it is only such that can thoroughly appreciate his verse. Had he written in the language of books, his poetry would have obtained a wider circle of readers. Attention was again called to Mr B.'s poems by a writer in *Macmillan's Magazine* for June 1862, in an article evidently from the same pen as that in the *North British*, and claiming for Mr B. a place 'at the very head of the properly idyllic poetry of England.' In that article, we are informed that in the previous year (1861), the pension-list, which announced a yearly grant of £50 to Mr Close, in consideration of his deserts as a poet, mentioned one scarcely larger in amount conferred on Mr B. in consideration of his acquirements as a philologist. Mr B. was born of humble parentage at Rush-hay, Bagber, Dorsetshire, in 1810, and was for many years Master of the grammar-school at Dorchester. He is B.D. of St John's College, Cambridge, was ordained in 1847, and was promoted from the curacy of Whitcombe to the rectory of Winterbourn-Came, in Dorset, in 1862. Besides the collections of poems mentioned, Mr B. is author of *An Investigation of the Laws of Case in Language* (Lond. 1840); *An Arithmetical and Commercial Dictionary* (Lond. 1840); *The Elements of English Grammar* (Lond. 1842); *The Elements of Linear Perspective* (Lond. 1842); *S. Gefysta (the Helper): an Anglo-Saxon Delectus* (Lond. 1849); *Notes on Ancient Britain and the Britons* (Lond. 1858); *Views of Labour and Gold* (Lond. 1859); *The Song of Solomon in the Dorset Dialect, from the authorised English Version* (Lond. 1859)—printed at the expense of Prince Louis Lucien Bonaparte; *Two, or a View of the Roots and Stems of the English as a Teutonic Tongue* (Lond. 1862). The philological works of Mr B. shew considerable learning and ability.

BARNUM, PHINEAS TAYLOR, American showman, was born at Bethel, Connecticut, July 5, 1810. His father was a tavern-keeper; and while young B. attended the village school, he traded with and played practical jokes upon his father's customers. At the age of 13, he was employed in a country store; and about five years afterwards, went largely into the lottery business. When only 19, he married clandestinely, and then moved to Danbury, where he edited *The Herald of Freedom*, and was imprisoned 60 days for a libel. In 1834, he removed to New York, where, hearing of Joice Heth, nurse of General Washington, he bought her for 1000 dollars, and with the aid of forged documents and puffing, exhibited her to considerable profit. Reduced again to poverty, he sold Bibles, exhibited negro dancers, and wrote for newspapers, until he bought the American Museum in New York, which he raised at once to prosperity by exhibiting a Japanese mermaid, made of a fish and monkey, a white negress, a woolly horse, and finally,

a noted dwarf, styled General Tom Thumb, whom he exhibited in Europe in 1844. In 1847, he offered Mademoiselle Jenny Lind 1000 dollars a night for 150 nights, and received 700,000 dollars—the concert tickets being sold at auction, in one case for 650 dollars for a single ticket. He built a villa at Bridgeport, in imitation of the Brighton Pavilion, and engaged in various speculations, one of which—a clock-factory—made him bankrupt. Settling with his creditors in 1857, he engaged anew in his career of audacious enterprises, and made another fortune. In 1866, he stood as a candidate in Connecticut for a seat in the United States Congress, but was unsuccessful. His *Autobiography* (1854) has the merit at least of frankness. His Lectures on Temperance and Making Money drew large audiences.

BAROACH, BROACH, or BHARUCH, a large town of British India, giving its name to a collectorate in the presidency of Bombay. It is situated on an elevated mound, supposed to be artificial, about 80 feet above the level of the sea, on the north bank of the Nerbudda, 25 miles from its mouth. The Nerbudda is here a noble river, two miles wide even at ebb-tide, but shallow, and the navigable channel winding and difficult even at high water. It abounds in fine fish. B. is a very ancient town; it is supposed to be the *Barygaza* of Arrian. Situated in the midst of a most fertile district, it was formerly a very flourishing town, with a large population; but fell, in consequence of political troubles, into decay. It has of late begun to recover prosperity, and its commerce is increasing. Its present pop. is estimated at 12,971, within the walls; but including the suburbs, which are extensive, the pop. is reckoned at 18,361. B. belonged to the Mussulman kingdom of Guzerat, on the overthrow of which by the Emperor Akbar, it was assigned to a petty nawab; and falling under the dominion of the Peishwa, was taken by the British in 1772, ceded to Scindiah in 1783, in acknowledgment of the kind treatment of some British prisoners; and again stormed by a British force in 1803, since which date it has remained in the possession of the British. The heat at B. is often excessive, and the situation is regarded as unhealthy. B. carries on a considerable trade with Bombay and Surat—the principal exports being raw cotton, grain, and seeds. It was long famous for its manufactures of cloth; but that of the finer kinds has fallen off very much, in consequence of the importation of English goods. Many of the weavers of B. are Parsees, of whom also are some of the more opulent classes—as ship-owners and ship-brokers. B. has one remarkable institution—a Brahmanical hospital for sick animals, into which horses, dogs, cats, monkeys, peacocks, and even insects are received. It is ostensibly attended by a number of Brahmans, who derive a good income from lands devoted to it, and from voluntary contributions.

BARQUESIMETO, a city of Venezuela, the capital of a province of the same name, situated on an affluent of the Portuguesa, in a high plain, 156 miles west-south-west from Caracas. B. was founded by the Spaniards in 1552; and in the beginning of the 19th c. was a flourishing town, with straight wide streets and some fine buildings, the pop. about 15,000; but in 1802, it was almost totally destroyed by an earthquake. The existing town has been mostly built from the ruins. The pop. is supposed to be about 12,000.—The province of Barquesimeto extends along the coast of the Caribbean Sea, contains an area of 9305 sq. m., and a pop. of about 113,000. Wheat, maize, coffee, cacao, indigo, and cattle are its principal products.

BARRA MANSA, a town of Brazil, in the province of Rio de Janeiro, and 70 miles north-west of the city of that name. It is situated on the right bank of the Parahiba. Pop. 6000.

BARROW-IN-FURNESS, a seaport and rapidly increasing town of North Lancashire, England, situated on the south-western coast of the peninsula of Furness, opposite to a small island called Barrow Island, which is traditionally reported to have been in former times a burial-place of Norse rovers. It is 8 miles south-west from Ulverston, and 18 miles west-north-west from Lancaster. It is connected by railway with Dalton (q. v. in SUPPLEMENT), from which it is not quite four miles distant, and so with the whole railway system of England. The growth of B. has of late years been so rapid as to be almost unparalleled in the history of the towns of England. In 1847, it was an insignificant fishing-village of about 300 inhabitants; in 1857, the population was more than 2000, a large proportion being sailors and fishers; and now (1867) the population is estimated at upwards of 12,000. This rapid increase is owing to the great quantity of iron ore, of the best quality—red hematite—which exists in the neighbourhood, and the establishment both of mines and smelting-works. A small quantity of iron ore from this neighbourhood was, for many years, exported to be smelted elsewhere; but about ten years since, smelting-works were established at B. by Messrs Schneider, Hannay, & Co., which soon gave employment to a great number of men, and converted the old fishing-village into a prosperous town. In 1865, these works produced about 160,000 tons of iron. In 1866, the Barrow iron-works were taken over by the Barrow Hematite Steel Company, which has now 11 blast-furnaces in constant operation, arranged in a straight line along the sea-shore. The Company raise their own ore, and the production of the mines for the present year (1867) is estimated at about 400,000 tons. The amount of pig-iron made weekly is about 4000 tons, of which about 800 tons are taken to the steel-works, and there converted by the Bessemer process into steel. Great quantities of limestone and coke are used in the iron furnaces and steel-works. The red hematite of B. yields an average of 57 per cent. of iron. The B. steel-works are the largest Bessemer steel-works in Britain, and their great enlargement is proposed. In the B. works, the iron is conveyed in a molten state from the blast-furnaces to the 'converters,' where it is made into steel. Some of the steam-hammers employed have heads of five tons weight, and some of six tons. Copper as well as iron ore is obtained in considerable quantity near B., and is exported to the amount of about 3000 tons annually. About 20,000 tons of slate are also annually quarried in the neighbourhood, and sent by coasters or by rail to other parts of Great Britain.

The town of B. is built on a regular plan, mostly in rectangles. St George's Church is a handsome Gothic building, erected chiefly at the expense of the Dukes of Devonshire and Buccleuch, the principal land-owners of the town and neighbourhood. There are other places of worship belonging to the Church of England and other denominations.

The Furness Railway Company have recently expended a large sum of money in converting the channel between the mainland and Barrow Island into docks. The total cost is estimated at £200,000. One dock, about 30 acres in extent, has been recently completed and opened (September 1867). It is expected that Barrow Island will soon become a great seat of iron shipbuilding. Various other branches of industry have also begun to be attracted to Barrow. Its foreign trade is still inconsiderable,

its chief import being timber from Canada. The harbour, however, is excellent, being formed by the island of Walney, a low island about eight miles long, and nowhere much more than a mile in breadth, which extends along the south-western coast of Furness. This island is separated from the mainland by a channel which, immediately to the north-west of Barrow Island, is very narrow, but on the south-west expands into a bay or basin of about three miles long by two broad, opening from Morecambe Bay. From the excellence of the harbour, the abundant facilities of railway conveyance, and the mineral wealth of the district, it may confidently be expected that B. will soon become a very important commercial town.

BARTHÉLEMY, AUGUSTE-MARSKILLE, a French poet and politician of some eminence, was born at Marseille in 1796. Whilst still very young, he was sent to the college of Juilly; and he had scarcely completed his studies when he began to acquire reputation in his native town as a poet of distinct promise. He was naturally attracted to Paris, where, at first, his verses, published without his name, did not attract much attention. Gradually, however, he became known; and in 1825, in conjunction with his fellow-townsmen, M. Méry, he issued a collection of satirical epistles, under the title *Les Sidiennes*; and the year after, a mock-heroic poem, *La Villéluade, ou la Priece du Châteaude Rivoli*. This vigorous political squib had a great success: in the course of the year, it ran through fifteen editions, and is said to have put into the pocket of the young authors some 24,000 francs. Continuing to work together in opposition to the government of Charles X., and in the interest of Napoleonic ideas, they put forth upwards of 20 pieces of a like satirical cast before 1830. The Revolution of July of that year found B. in prison for an offence done to the government in one of his later publications. His liberation of course was immediate; and along with his friend Méry, he celebrated the victory of the people in a poem dedicated to the Parisians, and entitled *L'Insurrection*, which is characterised by the great critic M. de Sainte-Beuve, as one of the happiest productions of the writers. A pension of 1200 francs, bestowed on him by Louis-Philippe, did not deter B. from attacking his ministers with the same asperity he had exercised towards those of the dethroned monarch; and in consequence, it was within a year or two withdrawn. During all the changes which followed, B. was indefatigable as a versifier on the political events of the day; but, except for readers intimately versed in the detail of these, the mere list of his numerous productions could have only the very faintest significance. The force and brilliancy of his satire is on all hands admitted; and though, in his later years, his popularity somewhat declined, his writings throughout exercised considerable influence in determining opinion among the lively population of Paris. He was, from the first, a warm supporter of the present Napoleonic régime. His death took place, August 1867, at Marseille, of which city he was librarian.

BASANTGANJ, a walled town of Oude, India, in the district of Salon, 55 miles north-west from Allahabad. Pop. 6000, of whom one half are Mussulmans.

BAUD, a town of the dep. of Morbihan, France, situated on the Eval, 20 miles north-west from Vannes. Pop. (1866) 1413. B. has some trade in grain, cattle, hemp, butter, and honey. Near B. is a statue of granite, known as the *Venus of Quinipily*, worthless as a work of art, but remarkable on

account of its history. Its origin is unknown, but it is supposed, from its Egyptian character, to be a Gallic Isia. Down to the 17th c., it was worshipped with fowl rites, and even now is regarded with superstitious veneration by the peasantry. It appears to have been first called Venus in inscriptions on the pedestal set up in 1689.

BAUPETTAH, a town of British India, in the presidency of Madras, 29 miles from Guntoor. Pop. supposed to be about 20,000.

BAYAMO, or **SAN SALVADOR**, a town in the eastern part of the island of Cuba, 60 miles north-west from Santiago. It is situated in an unhealthy plain, near the left bank of the Canto, a small river which falls into an arm of the sea called the Canal of Bayamo. The town carries on a considerable trade. Pop. (1861) 7411.

BEAUREGARD, **PETER GUSTAVE TOUSSAINT**, a general of the army of the Confederate States of America during the War of Secession, was born of a family of Canadian French descent, on his father's plantation, near New Orleans, Louisiana, about 1821. He graduated the second of his class at the military college of West Point in 1838; was appointed second-lieutenant of artillery, and transferred to the engineers; won his brevet of Captain at the battles of Contreras and Churubusco, in Mexico, and of Major at Chepultapac, where he was twice wounded. After the Mexican war, he was engaged upon the fortifications of the Mississippi, and was, for a time, superintendent of the military academy at West Point. At the secession of Louisiana, he resigned, February 20, 1861, and was appointed by the Confederate government to the command at Charleston, South Carolina, where, April 11, he commenced the war by the bombardment of Fort Sumter (q. v.). July 21, he won the battle of Bull Run. March 5, 1862, he took command of the Army of the Mississippi, under General A. S. Johnston, and on April 6, fought the battle of Shiloh—on the first day a victory, and on the second, when the Federals had been reinforced, a partial defeat to the Confederates, with the loss of General Johnston. After holding General Halleck in check for two months, he was obliged, by his failing health, to retire for a time from active service; but in 1863 defended Charleston; and in 1864 commanding at Petersburg, aided General Lee in the long and gallant defence of Richmond, the capture of which closed the war. He has since been appointed President of the New Orleans and Mississippi Railway; and in 1866, in the interests of the Company, he visited New York, London, and Paris, being everywhere received with the highest distinction.

BE'CSÉ, New, a market-town of Austria, about four miles east from Old Becse. Pop. 6472.

BECSE, Old, a market-town of the Austrian Empire, in the Servian Woiwodschaf, 24 miles north-north-east from Neusatz. Pop. 11,222.

BEDNO'RE, or **NUGGUR**, a large city of Mysore, India, situated in the midst of a basin in a rugged tableland of the Western Ghauts, at an elevation of more than 4000 feet above the sea, in N. lat. 13° 50', E. long. 75° 6', 150 miles north-west from Seringapatam. It was at one time the seat of government of a rajah, and its pop. exceeded 100,000. In 1763, it was taken by Hyder Ali, who pillaged it of property to the estimated value of £12,000,000, and subsequently made it the seat of his own government, calling it Hyder-nuggur (Hyder's Town), of which the name Nuggur is an abridgment. It was taken by the British under General Matthews in 1783, but soon retaken

by Tippoo, at the head of a vastly superior force, when General Matthews and all the principal British officers were put to death. The neighbouring country is mostly covered with dense and luxuriant forests.

BED-SORES are often a very troublesome complication of disease, to which a patient is liable when for a long time confined to bed, and is either unable or is not allowed to change his position. Thus they are liable to occur in cases of continued fever, or any other prolonged debilitating disorder, in paralysis from injury of the spinal cord, and in cases of fracture of the thigh. The skin, at certain projecting bony parts, chiefly about the region of the buttocks, or on the heel, is apt to inflame, ulcerate, and slough, especially if the patient is not kept perfectly clean—as, for example, when the evacuations and urine escape involuntarily. The patient sometimes complains of a sense of discomfort at the parts, as if he were lying on dry crumbs of bread; at other times, he seems to feel nothing. Hence, in all cases of prolonged supine position, the parts naturally pressed upon by the weight of the body should be carefully examined every day or two, as prevention is far easier than cure. When a long confinement to bed is expected, attempts should be made to thicken the cuticle, and enable it to bear pressure better, by rubbing the skin with a stimulant such as spirits or eau-de-Cologne. If the part, when first seen, looks red and rough, further damage is often prevented by covering it with a piece of calico, on which soap-plaster has been spread; the local pressure may be removed by air-cushions specially constructed for cases of this kind, and in many instances, Arnott's Water-bed (q. v.) affords great comfort. If the case is one in which it is admissible, the patient should be made to alter his position frequently. When there are excoriations, and a threatening of sloughing, a poultice composed of equal parts of bread-crumbs and of finely-grated mutton suet, mixed over the fire in a saucepan, with a little boiling water, is often a comforting and useful application. After sloughing has fairly begun, stimulating applications, such as resin ointment, must be applied. It is worthy of notice, that bed-sores come on earlier in cases of fractured spine than in any other: they generally appear by the fourth day, and have been seen two days after the accident. They commonly form one of the most powerful agents in destroying life in cases of this accident, diseases of the urinary organs being the other.

BEET-ROOT SUGAR. Recent statistics of this manufacture afford the following results: The quantity of beet-root sugar made on the continent in two successive years was, in round numbers, as follows:

| | 1865—1866 (tons). | 1864—1865 (tons). |
|-----------------------------|-------------------|-------------------|
| Zollverein, | 185,000 | 165,000 |
| France, | 138,000 | 129,000 |
| Austria, | 75,000 | 65,000 |
| Russia, | 48,000 | 40,000 |
| Belgium, | 25,000 | 22,000 |
| Baltic countries, | 10,000 | 10,000 |
| Holland, &c., | 3,000 | 3,000 |

In 1865—1866, there was a very large increase of quantity, nearly, but not quite maintained in 1866—1867:

| | 1865—1866 (tons). | 1866—1867 (tons). |
|-----------------------------|-------------------|-------------------|
| Zollverein, | 185,000 | 200,000 |
| France, | 275,000 | 200,000 |
| Russia, | 100,000 | 125,000 |
| Austria, | 68,000 | 78,000 |
| Belgium, | 41,000 | 30,000 |
| Baltic countries, | 17,000 | 15,000 |
| Holland, &c., | 4,000 | 6,000 |

It is evident from these figures that France has fluctuated more than any other of the continental countries in the quantity produced. The beet is

more precarious than the cane, both in the production of plant per acre of land, and of sugar per ton of plant. There were 336 beet-sugar factories in Russia in 1864, 270 in the Zollverein in 1865, 439 in France in 1866. A good yield is said to be 20 tons of root per acre, and one ton sugar from 12 tons root; but sometimes there is the far lower estimate of 1000 lbs. sugar per acre, seeing that clumsy processes as well as bad seasons limit the yield. The United States began the beet-sugar manufacture in 1862; the civil war interrupted it; but in 1866, a new German company was established at Chataworth, in Illinois, with new seeds to plant, and new refining apparatus. In the autumn of 1866, they had 600 acres of beet growing. The attempts to make beet-sugar a profitable manufacture in Ireland, have never met with much success, although often renewed. Were it not that English land is so very valuable, this branch of industry would probably have taken root among us.

The distilling of spirits from beet has not been so successful as the making of sugar. It received a temporary impetus from the Reports of the Paris Exhibition in 1855; but there has always been a difficulty in making the residue available as cattle-food. A new distillery was established at Lincoln in 1858, for obtaining spirit from beet and mangold-wurzel; and a new mode of applying the residue (half a ton from every ton of root) as cattle-food. But these and all other attempts in England have failed. The Commissioners of Inland Revenue said in 1864: 'After patiently watching these experimental distilleries for seven years, we are relieved from further anxiety on the subject by the final relinquishment of the manufacture by the last of those gentlemen who had embarked in the undertaking. We understand that in all these cases the experiment has entirely failed as a commercial speculation.'

As to its uses in other ways, Payen recommends the mixture of beet farina with flour, in the proportion of 1 to 2, for bread, which he says makes and bakes well, and keeps good for five days. Beet has been made into a kind of pasteboard or papier-mâché, in Haute Marne, for tea-trays and ornaments. Beet coffee, or *betterave torréfiée*, mixed with an equal weight of West India coffee, is used to some extent in France, as being less heating, and requiring less sugar than the latter singly.

BELJURIE, or **BAILJURIE**, a town of India, in the British district of Moradabad, North-west Provinces, two miles north-west from Kashipur. Pop. 7354.

BELLEVILLE, chief town of the county of Hastings, Canada West, situated on the Bay of Quinté, Lake Ontario, and on the Grand Trunk Railway of Canada, 42 miles west from Kingston. It is a very thriving town. Here are several iron foundries. Pop. (1861) 7000.

BELLOWS. See **BLOWING-MACHINES**.

BELLUR, a large town in the territory of Mysore, India, 40 miles north from Seringapatam, with a fort, which has a strong mud rampart and ditch. The town itself was formerly protected by a similar rampart, which is now ruinous.—Another town of the same name, also in Mysore, is situated 60 miles west-north-west from this, a mile from the west bank of the river Yagachi, or Bhadri, one of the head-waters of the Cavery.

BELLOIT, a city of Wisconsin, U. S., on Rock River, on the Southern State Railway, 75 miles south-west of Milwaukee, built on two plains, one 70 feet above the other, with broad shaded streets, groves, and handsome residences. It has a college, 9 fine churches, several flour and paper mills, foundries,

and manufactories of agricultural implements, &c. Pop. (1865) over 5000.

BELPA'SSO, a town of Sicily, on the lower part of the southern slope of Mount Etna, in the province and 8 miles north-west from the town of Catania. Pop. (1861) 7038. Below the town is an expanse of brown lava, but the surrounding country is generally rich and fruitful. A town called Mel Passo, from the abundance of honey in its neighbourhood, stood not far from the site of the present town, but was destroyed by an eruption in 1669; when the inhabitants removed to a locality a few miles off, in the plain, and built a town of which the desolate remains are still to be seen, bearing the name of *Belpasso Vecchio*; malaria compelled them to leave it, and to return to the mountain-slope, notwithstanding its occasional dangers.

BELPER, a market-town of Derbyshire, England, on the Derwent; a station on the North Midland Railway, seven miles north from Derby. It is well built, in great part of gritstone, which is obtained in the neighbourhood. One of the most conspicuous public buildings is a church, of recent erection, on an eminence above the town; the union workhouse is also worthy of notice, being a splendid building in the Elizabethan style of architecture. B. is, to a considerable extent, a town of recent growth, and owes its prosperity to the establishment of cotton-works here by Messrs Strutt, one of whom was recently elevated to the peerage as Lord Belper. In these works, a very great number of operatives are employed. The manufacture of silk and cotton hosiery is also largely carried on in B., giving employment to upwards of 2000 persons. Nail-making and the manufacture of brown earthenware also give employment to many of the inhabitants. B. was at one time the residence of John of Gaunt, part of whose mansion still remains. Pop. (1861) 9509.

BENAVENTÉ, a town of Spain, in the province of Zamora. It is situated on the western or right bank of the Esla, opposite to the mouth of the Cea, 34 miles north from Zamora. It is overlooked by a huge half-ruined castle, and surrounded by a decayed mud-wall, in which are six gates. It has spacious streets and squares, six churches, a number of schools, three hospitals, a bishop's palace, &c. The castle was formerly the seat of the family of Pimentel, Counts of Benavente, to whose progenitor it was granted in 1394. The interior of the castle was desolated by Soult, on his retreat from Oporto, and fragments of sculpture still lie scattered about. It was at B. that Moore's retreat commenced, 28th December 1809; and it was the scene of other interesting events of the Peninsular War. The manufactures of B. consist of linen, woollen, silk, and cotton fabrics. Pop. 12,464. There is no bridge at Benavente. The Esla is crossed by a ferry-boat.

BENEDICT BISCOP, an English ecclesiastic of the 7th c., who exercised a most important influence on Anglo-Saxon civilisation and learning. He was born about the year 629, of a noble Northumbrian family (his patronymic, according to Eddius, being Baducing), and until about his 25th year, was a courtier of Oswin, king of Northumberland. About that time, he gave up his court-life, and accompanied Wilfred to Rome (654), where he spent about ten years in study, and from which he seems to have returned soon after the synod of Whitby in 664. In 665, he was in Rome a second time, being sent on a mission by Alchfrid, king of Northumbria. After a stay at Rome of a few months, he proceeded to Lerins, in Provence, where he became a monk, received the tonsure, and spent

about two years, thus acquiring a knowledge of monastic discipline. He returned to Rome in 668, came to England with Theodore and Adrian, and was made abbot of the monastery of St Peter (afterwards that of St Augustine) in Canterbury. This he resigned two years after, and went to Rome for a third time, for the purpose of bringing home the literary treasures which he had already collected. He returned about 673, bringing with him a large collection of valuable books, and repaired to Northumbria, where King Egfrid gave him land near the mouth of the Wear, on which he founded the famous monastery of Wearmouth. Workmen were brought from France to build and glaze the church and monastery, this being one of the earliest instances of the use of glass for windows in England. He also introduced from Gaul and Rome (which he visited again in 678) church utensils and vestments, relics, pictures, images, and again a vast number of books. He also brought with him John, arch-chancellor of St Peter's, who introduced the Roman choral service. On his return from this visit to Rome, King Egfrid presented him with more land on the other side of the Wear, at a place called Girwi, on which he built a second monastery, dependent on Wearmouth. B. made his fifth and last journey to Rome in 685, and, as on former occasions, came home loaded with books and pictures, bringing with him also, according to Bede, two silk palls 'of incomparable workmanship.' Shortly after his return from Rome, about 687, he was seized with palsy, under which he languished three years, dying on the 12th January 690. During his long illness, he often anxiously exhorted his monks to look carefully after his books, and preserve them from loss or injury.

The benefits conferred by B. on Anglo-Saxon civilization, which was then only in its dawn, and the impulse given by his labours to Anglo-Saxon learning, were greater than can now be estimated. It is not certain that he wrote any books, and those ascribed to him are of little value; but by his personal teaching, and especially by his founding at Wearmouth such a valuable and, for the time, extensive library, he implanted in the nation a taste for literature and learning, which soon was fruitful in results, and continued to be so for many centuries. Bede, who was his pupil, has written a life of B., and the numerous works of this 'venerable' author are the best proof of the extent and variety of information to which he had access in the monastery of Wearmouth.—See Wright's *Biographia Britannica Literaria*.

BENEDICT, JULES, a musician and composer, German by birth, but, since 1836, resident in England. He was born at Stuttgart in 1805, and studied first under Hummel at Weimar, and afterwards under Weber at Dresden. On Weber's recommendation, he was, in 1824, made music director of the Kärntner Thor Theatre, Vienna; and he afterwards filled the same post in Naples. While in Naples, he produced an opera buffa called *Gracina ed Ernesto*, and an opera seria, *I Portogesi a Goa*. In Paris, and afterwards (1835) in London, he appeared with great success as a pianist. In 1836, he took up his permanent residence in London, and was, during that year, director of the opera buffa at the Lyceum, where he produced an operetta of his own, composed in Naples, *Un Anno ed un Giorno*. Turning his attention afterwards to English opera, he composed *The Gipsy's Warning* (1838), *The Brides of Venice* (1844), and *The Crusaders* (1846), three works which, translated into German, have been well received in the composer's native country. He conducted the opera in Covent Garden Theatre in 1843 and 1844, and the Norwich

Musical Festival in 1845, and has since conducted much at concerts and great musical gatherings in London and in the provinces, besides being a successful pianoforte teacher. In 1850, he conducted at Mademoiselle Jenny Lind's concerts in America. In 1860, he produced a cantata, *Undine*, at the Norwich Musical Festival, which was very well received. His *Lily of Killarney*, first given in 1882, at Covent Garden, was his greatest operatic success. He has since produced a cantata, *Richard Cœur de Lion*; an opera di camera, *The Bride of Song*; a romantic opera, *Esmeralda*; and a cantata, *St Cecilia*. His operas have much dramatic, and melodic beauty, and in style and feeling are singularly English, to be the composition of a foreigner. B. has also composed music to *The Tempest* and *Macbeth*, besides numerous songs, orchestral pieces, and pianoforte works both in the classical form and of a lighter style.

BÉPU'R, or **BEYPORE**, a seaport of India, on the western coast, six miles south from Calicut, at the north side of the estuary of a small river which rises in the Western Ghauts. Its situation is very beautiful. It has a considerable trade in timber, particularly teak, which is floated down the river for exportation. Iron ore is found in the neighbourhood, and iron-works have recently been established here. B. is the terminus of a railway now in course of construction, across the peninsula of India from Madras, and will probably soon become a place of great importance.

BERCETO, a town of Italy, in the province and 25 miles south-west from the city of Parma, beautifully situated amongst the Apennines. It is a clean, well-built town. The church is an old Gothic building. The mountains rise rapidly to the west of B., and some of the scenery which they present is very wild and desolate.

BERGA, a town of Catalonia, Spain, situated near the river Lobregat, 52 miles north-north-west from Barcelona. Its streets are paved, but mostly narrow and crooked. It has five squares, three churches, several convents, a hospital, schools, &c. It is overlooked and defended by a castle with a strong battery. Pop. 6333, mostly employed in husbandry and as muleteers; the produce of the fields, vineyards, and olive-yards of the neighbourhood giving rise to a considerable trade. Cotton fabrics are also manufactured in B., and this branch of industry is on the increase.

BERGEDORF, a town of Germany, on the Berlin Railway, 10 miles east-south-east from Hamburg. It is a place of considerable trade, and is the capital of a very small territory, of about 36 sq. m., under the joint government of the free cities of Hamburg and Lübeck. Pop. of territory above 12,000. Part of this territory is known by the name of the Four Lands (*Vierländer*). It is inhabited by a well-conditioned and industrious population, much occupied in the cultivation of fruit and vegetables, not only for the market of Hamburg, but for that of London. Peach and apricot orchards, and fields of strawberries, extend over great part of the district. Cattle-husbandry is also carried on, and much attention is devoted to the rearing of poultry. The people of the Four Lands are distinguished from their neighbours by peculiarity of dress, and even each of the four small communities from which the name has been derived has some distinguishing peculiarity of its own.

BE'RI, a town of India, in the British district of Rohtuk, North-west Provinces, in N. lat. 28° 40', E. long. 76° 40', 36 miles west-by-north from Delhi. Pop. nearly 10,000.

BERKHAMSTEAD, GREAT, or BERKHAMSTEAD ST PETER'S, a market-town of Hertfordshire, England, situated in a deep valley, on the right bank of the small river Bulborn, on the Grand Junction Canal and the London and North-western Railway, 28 miles north-west from London. The main street is about a mile in length. The town is well built, mostly of brick. The parish church, a cruciform building in the centre of the town, is chiefly in the Perpendicular style. The father of the poet Cowper was rector of B., and the poet himself was born here. The town is supposed to be of Saxon origin, and the kings of Mercia had a palace or castle here. William the Conqueror met the nobles and prelates at B., and took an oath to rule according to the ancient laws and customs of the country. He bestowed the castle and manor of B. on his half-brother, the Earl of Moreton. The castle was rebuilt in the reign of King John. The property having reverted to the crown, was bestowed by Edward III. on his son, the Black Prince, when he created him Duke of Cornwall, and has since been held by the Princes of Wales as Dukes of Cornwall. A few massive fragments of the wall of the castle still remain, to the east of the town. A free grammar-school was founded in the reign of Edward III., and still subsists, having been lately much enlarged and enriched by the establishment of several exhibitions. A charity-school was founded under the will of Thomas Bourne in 1727. Straw-plaiting is carried on to a considerable extent in B., and a vast number of wooden articles are made, as bowls, cricket-bats, hoops, toys, &c. The curing of ham is now extensively carried on. There is a weekly corn-market. Pop. (1861) 3631, since which time it has considerably increased.

BERNALDA, a town of South Italy, in the province of Potenza, 32 miles west-by-south from Taranto. Pop. (1861) 5862.

BERNARD, CLAUDE, a distinguished physiologist, was born at Saint-Julien, near Villefranche, in the dep. of the Rhone, on the 12th July 1813. He studied medicine at Paris; was admitted in 1839 as a pensioner in one of the hospitals; and in 1841, became Magendie's assistant at the College of France. He graduated in 1843 as Doctor in Medicine, and ten years later, as Doctor in Science; and was appointed in February 1854, to the chair of General Physiology in connection with the Faculty of Sciences in Paris. The same year, he was chosen member of the Academy of Sciences; and in 1855, he succeeded Magendie as Professor of Experimental Physiology in the College of France. B.'s first researches were devoted to the physiological action of the various secretions of the alimentary canal. His Memoir, published in 1844, in the *Gazette Médicale*, treats of the mechanism by which the gastric juice is secreted, and also of the modifications which alimentary substances undergo from that liquid. To the *Comptes Rendus* of the Biological Society he also contributed papers on the Saliva, on the Intestinal Juice, on the Influence of the Different Pairs of Nerves on the Digestive Apparatus, and on the Respiratory and Circulatory Systems. His first really original paper, however, was that on the Function of the Pancreas, in which he demonstrated that that viscus is the true agent of the digestion of fatty bodies. This essay obtained, in 1849, the grand prize in experimental physiology, and was printed in the *Comptes Rendus* of the Academy of Sciences in 1856. In 1849, appeared his first researches on the Glycogenic Function of the Liver, establishing the doctrine, that the blood which enters the liver does not contain sugar; while blood which leaves that organ, and goes to the heart by the hepatic veins, is charged

with it. He also shewed the influence of the nervous system on this function, and produced artificial diabetes by division of the pneumogastric. For this discovery, which was keenly criticised, but is now regarded as sound, he obtained, in 1851, the grand prize in experimental physiology. In 1852, he laid before the Institute his *Experimental Researches on the great Sympathetic System, and on the Influence exerted by Division of this nerve on the Animal Heat*. This paper procured him, for the third time, the prize of experimental physiology in 1853. Since 1854, when he succeeded Roux as Member of the Institute, he has continued his researches on the glycogenic function of the liver, and has also published his courses of lectures at the College of France, on *Experimental Physiology in its Application to Medicine* (1855-1856); on *The Effects of Toxic and Medicated Substances* (1857); on *The Physiology and Pathology of the Nervous System* (1858); on *The Physiological Properties and the Pathological Alterations of the various Liquids of the Organism* (1859); on *Nutrition and Development* (1860); and his *Introduction to the Study of Experimental Medicine* (1865). In 1861, he was elected Member of the Academy of Medicine (Anatomical and Physiological Section); and on the 31st July 1862, he received the distinction of Officer of the Legion of Honour.

BERNAY, a town of France, in the dep. of Eure, pleasantly situated on the right bank of the Charentonne, 26 miles west-north-west of Evreux. Pop. (1866) 5731. Woollen, linen, and cotton manufactures are actively carried on, also paper-making, bleaching, dyeing, and tanning. There is a considerable trade not only in the products of these manufactures, but in grain, cider, horses, and cattle. B. is the seat of the greatest horse-fair in France, which is held in Lent, and is attended by nearly 50,000 persons, who congregate from all parts of France, chiefly to purchase post and diligence horses, for which Normandy has long been celebrated. B. is the seat of a tribunal of commerce. The church of St Croix has a large and magnificent altar, and marble statues and sculptures: the church of La Conture was formerly celebrated for the cure of persons possessed of evil spirits. The grain-market occupies part of the remains of an interesting old abbey church. B. has a communal college, and a hospital.

BERTINO'RO, a town of Italy, in the province of Forli, formerly belonging to the Papal States, six miles south-east from Forli, pleasantly situated on a hill, the slopes of which are famous for their wines. At the foot of the hill, to the west, flows the Ronco. B. is the seat of a bishop, and has a cathedral, three other churches, and five convents. It was one of the ancient fiefs of the Malatesta, by whom it was given to the church. Pop. of commune 6388.

BESSÈGES, a large and thriving village of France, in the north of the dep. of Gard, 11 miles north from Alais. It is situated on the river Ceze. A railway connects B. with Alais. There are extensive coal-mines in the neighbourhood. Pop. (1866) 7969.

BESSENOVA, a large village of the Austrian Empire, in the Woiwodena, on the north bank of the Aranka, eight miles west-south-west from St Miklos. Pop. 7896.

BETHLEN-GABOR (or, as he would be called in Western Europe, **GABRIEL BETHLEHEM** or **BETHLEEN**, it being a common custom in Hungary and Transylvania to make the baptismal name of the family name) was descended from an ancient and distinguished Protestant family of Upper Hungary.

which also possessed important estates in Transylvania, and was born in 1580. He rose to prominence during the troubles which distracted the principality in the reigns of the two Bathories, Sigismund and Gabriel; and on the death of the latter of these unfortunate princes, succeeded (1613), by the aid of the sultan, in being chosen sovereign prince of Transylvania, the House of Austria being at that time in no condition to offer effective opposition. In 1619, when the Bohemians rose in defence of their religious and political rights, they looked eagerly for support to B., who had already gained a wide reputation as a warrior and a champion of Protestantism; and the Transylvanian prince, too glad of such an opportunity to gratify his ambition at the expense of his enemy, Austria, eagerly proffered his support. He accordingly marched into Hungary, took Kaschau, his advance more resembling a triumphal procession than a hostile invasion, and on arriving under the walls of Presburg was greeted with every mark of joy by the citizens. With an army now swelled by Hungarian volunteers to nearly 100,000 men, he pursued his route towards Vienna, driving before him the Spaniards under Bucquoy, and the Austrians under Dampierre; and would doubtless have captured the capital, had not the severity of the season, and the want of provisions, combined with the reinforcement of his opponents, and the defeat of his lieutenant, Ragotaki, in Hungary, compelled him to retreat for a time. However, though he retired as far as Kaschau, he did not relinquish his hold of Hungary, of which, by the assembled diet, he had been crowned king at Presburg, 25th August 1620; but, resuming the offensive, on the defeat and death of Bucquoy, before Neuhausel, he recovered the fortresses which the imperialists had retaken, and spread terror and devastation to the gates of Vienna. His allies, the Protestants of Germany, being apparently crushed, B. concluded peace with Ferdinand II., receiving the town of Kaschau, with seven Hungarian counties adjoining Transylvania, the principalities of Oppeln and Ratibor in Silesia, and the dignity of prince of the empire. This treaty, however, was soon broken by the emperor, who thought so favourably of his own situation as to imagine he could violate his agreement with impunity; but he was soon undeceived, for B. raising an army of 60,000 men, invaded Moravia, obtained the solemn renewal of the former treaty, and then retreated homewards. His marriage with Catharine of Brandenburg in 1625 involved him once more in the Thirty Years' War; but he finally retired from the contest in the following year, and thenceforth devoted himself exclusively to the internal affairs of Transylvania. He died in 1629, after a lingering and painful illness. B.'s reign was a glorious and flourishing epoch in the history of the little principality; for not only did the great successes achieved through his military talents give a prestige to its arms, but his protection of science and letters, in both of which he was well accomplished, did much to aid the progress of learning. He founded the Academy of Weissemburg at Karlsburg, and installed there, as professors, Opitz, Alstedt, Biesterfeld, and Piscator.—His brother STEPHEN succeeded him, but was soon compelled to resign the throne.—To the same family of Bethlen belong JOHN and WOLFGANG, both Chancellors of Transylvania, the former of whom is celebrated for his work *Rerum Transylvanicarum, libri iv.* (Hermannstadt, 1683), which gives the history of the principality from 1629 to 1663; and the latter of whom wrote a History in 16 books, the MS. of which, from long neglect, had been much damaged, but which was afterwards restored and completed, and published

(6 vols.) at Hermannstadt in 1792, under the title of *Wolfgangi de Bethlen Historia de Rebus Transylvanicis* (1526—1609).

BEUST, FRIEDRICH FERDINAND FREIHERR VON, Austrian prime-minister, one of the most prominent modern politicians. His family is of old nobility, distinguished both in the field and the cabinet. B. was born on 13th January 1809, at Dresden, and after a careful preliminary education in Dresden, he attended the universities of Göttingen and Leipzig. Having conceived early a liking for politics, he devoted himself to diplomacy. After spending some time in travel (1834—1835), he served as secretary of embassy, first in Berlin, and then in Paris. In 1838, he represented his government at Munich, where he began to shew his diplomatic talents, and soon acquired a certain celebrity. Eight years later, he went to London in the same character, from which he was removed in 1848 to Berlin. When called back to Dresden in 1849, he received the portfolio of Foreign Affairs. In this office, he declared against the adoption of the new constitution for the German Empire, and when thereupon an insurrection broke out in Dresden, he called in the assistance of Prussian military, which speedily crushed it. A few years later, he was made Minister of the Interior. On the death of Frederick VII. of Denmark (1863), B. came forward prominently as the exponent of the German national feeling on the Slesvig-Holstein question. In the name of his government, he disavowed the London protocol, and urged a policy favourable to the wishes of the Duchies, and in harmony with the national feeling of Germany. And, indeed, so prominent and popular did he become at this time, that he was sent as representative of the German Bund (the first that ever was sent) to the London Conference, where he stood his ground firmly, taking for his basis the principle of nationalities. Always the friend of Austria, he naturally supported that country in the crisis of 1866, joining in the declaration of war against Prussia, against the wishes of at least the liberal party in Saxony. After the termination of the 'six weeks' war,' and the decided defeat of his party, he was obliged, at the demand of Prussia, to resign his office, on account of his hostile attitude towards that country. He has since entered the service of Austria, and risen to the head of affairs. The chief result of his policy in the reorganisation of the empire is the reconciliation of Hungary (1867) on the footing of its remaining a separate kingdom. See GERMANY in SUPPLEMENT.

BEÜTHEN, or BÜTOM, a town of Prussian Silesia, the capital of a circle of the same name, in the government of Oppeln, and 50 miles south-east from Oppeln, near the Polish frontier. It has manufactures of woollen cloths and earthenware. The language generally spoken is Polish. Pop. (1864) 12,852.

BEZDAN, a market-town of the Austrian Empire, in the Woiwodena, about three miles east of the Danube, and 12 miles west-north-west from Zombor. Pop. 7782.

BHADARSA, a town of British India, in the district of Puckhamrat, in Oude, on the Tons, 75 miles east from Lucknow. Pop. 5000, of whom 2000 are Mussulmans. Here is an eleemosynary establishment, founded by the Nawab Vizier Asaf ud Dowlah, with an endowment of 15,000 rupees a year, the proceeds of which are divided indiscriminately among Mussulman and Hindu religious mendicants. It is under the charge of a Seiad, or descendant of Fatima.

BHANPURA. See BAMPURA.

BHATGONG, one of the chief towns of Nepal,

situated about 9 miles south-east from Khatmandu. It contains a palace of striking appearance, and other notable buildings. It is the favourite residence of the Brahmans of Nepal, who form the greater part of its inhabitants. Its present pop. is estimated at 12,000, but it is supposed to have once contained 60,000 inhabitants.

BHOJPUR, a town of Oude, India, in the district of Bainswarra, five miles from the left bank of the Ganges, and 50 miles south from Lucknow. Pop. about 9000, of whom only 150 are Mussulmans.

BHOWA'N, BHOWANY, or BHEWANNEE, a town of British India, in the district of Rohtuck, North-west Provinces, 55 miles west of Delhi. It has a fort, and was formerly the stronghold of a petty chief, on account of whose hostile acts it was taken by the British in 1809. The pop. is said to be 29,442.

BHU'JI, or BIJI, a small hill-state of India, extending for about 20 miles along the left bank of the Sutlej, and about 7 miles at its greatest breadth. Its centre is in about 31° 13' N. lat., 77° 16' E. long. Its pop. is supposed to be about 25,000. Having been overrun by the Goerkhas, it was, on their expulsion, bestowed by the British government on the present family.

BIA'NA, a town of India, in the territory of Bhurtpore, 23 miles south-west from Bhurtpore. It is situated on an eminence in a small plain, between two ranges of hills. It was once a place of much greater importance than it now is, and was one of the most famous forts in India. The town contains many temples, and the whole ridge of the hill is covered with the remains of large buildings. A high pillar of stone called Bhim Lat, or the *Staff of Bhim*, is conspicuous over a wide extent of country.

BIGAHPUR, a town of Oude, India, in the district of Bainswarra, four miles from the left bank of the Ganges, and 40 miles south-west from Lucknow. Pop. 6000, of whom only about 100 are Mussulmans.

BIHA'R, or BAHADURGANJ, a town of Oude, India, 44 miles north-west from Allahabad. It has a fort. Pop. about 10,000.

BIJAPORE, a town of India, in Guzerat, in the Guicowar's territory, on the route from Mhow to Deesa, 200 miles north-west from Mhow, and 60 miles south-east from Deesa. Pop. 12,000.

BIJAWUR, a town of Bundelcund, India, the capital of a small territory of the same name. It is situated in a mountainous tract, 115 miles west from Rewa, in 24° 37' N. lat., 79° 31' E. long.—The raj or state of Bijawur contains an area of 920 sq. m., and a pop. of about 90,000. It pays no tribute, but is required to maintain a force of 100 cavalry and 1300 infantry.

BIJNO'UR, a town of India, the chief town of the British district of the same name, North-west Provinces, in 29° 22' N. lat., 78° 11' E. long. It is on the route from Moradabad to Mozuffurnuggur, 81 miles east from Mozuffurnuggur. Pop. about 11,000.—The district of Bijnoor has an area of 1904 sq. m., and a pop. of about 696,000. Cotton, sugarcane, and wheat are the principal crops.

BIKAN'IR, or BEEKANEER, a town of India, the capital of a Rajpoot state of the same name, in N. lat. 28°, E. long. 73° 22'. It is situated in a singularly desolate tract, hard, stony, and utterly unfit for cultivation. The town is surrounded with a battlemented wall, and has a very imposing appearance. The pop. is estimated at 60,000.—The state of Bikanir extends from north to south about

160 miles, and from east to west about 200 miles. Its area is 17,676 sq. miles. The climate is remarkable for extreme changes of temperature, the temperature during the night being often very cold, whilst the day is very hot. Ice is often formed on ponds in winter during the night, whilst the summer heat during the day sometimes reaches 123° Fahr. The majority of the population are by descent Jauts, a people inhabiting from a very remote period a great extent of country between the Himalaya and the Indian Ocean. The rajah and dominant race are Rajpoots. Brahmans are numerous, but if they do not eat, they trade in oxen. There are many Jains. The burning of widows was in former times extremely prevalent in Bikanir. One corpse is said to have been burned with 84 victims. The annual revenue of the state is about £65,000. The military force amounts to about 5000. The pop. is about 540,000.

BI'LSA, or BHILSA, a town of India, in Malwa, in the territory of Gwalior, Scindia's dominions, on the right bank of the Betwa, 188 miles south from Gwalior, and 32 miles north-east from Bhopal. It is situated on an elevated mass of trap rock, and has a fort enclosed by a stone wall, and furnished with square towers and a ditch. Outside the walls, are some spacious streets, and many good houses. B. was taken from the Hindus by Samsuddin Altamsh, sovereign of Delhi, in 1230; and after several times changing hands between Hindu and Mussulman masters, was finally incorporated with the empire of Delhi by Akbar in 1570. The pop. is about 30,000. B. and the pergunnah of which it is the capital, are said to yield a revenue of 325,000 rupees. The finest tobacco produced in India is from a small piece of land, about three acres, near Bilsa. Its superiority is said to be entirely owing to careful cultivation. There is at B. a brass cannon, of beautiful workmanship, said to have been made by order of Jehangir, 19½ feet in length, with a bore of 10 inches.

BI'MAH, a river of India, a branch of the Kistnah (q. v.), rises in the table-land of the district of Poona, in the presidency of Bombay, at an elevation of 3090 feet above the level of the sea, and following in a south-eastward direction, falls into the Kistna, in N. lat. 16° 24', E. long. 77° 20', after a course of more than 500 miles.

BINO'NDO, a town of the island of Luzon, Philippines, on the right bank of the Pasig, opposite to Manila, with which it is connected by a magnificent stone bridge, 411 feet in length. This bridge is regarded as the greatest structure erected by Europeans in the East. B. is chiefly inhabited by natives of the Philippines, but is also the residence of some Europeans. It is the seat of government of the province of Tondo. Pop. 29,200.

BIO'RNEBORG, a seaport town of Finland, on the Gulf of Bothnia, at the mouth of the Kumo, 76 miles north-north-west from Abo. Pop. (1861) 7105. Shipbuilding is carried on. Timber, pitch, and tar are the principal exports.

BIROH, SAMUEL, keeper of the Oriental Antiquities in the British Museum, is a son of the late Rev. S. Birch, rector of St Mary Woolnoth, in the city of London, and was born in London, in the year 1813. B. was educated at Merchant Taylors' School. In 1834, he entered the public service under the Commissioners of Public Records; and in 1836, he obtained the appointment of assistant in the department of Antiquities, British Museum. In this capacity, B. acquired an extensive acquaintance with archæology in all its branches. He studied not only Greek and Roman antiquities, including numismatics, but applied

himself with untiring zeal to Egyptian hieroglyphics. In process of time, he so distinguished himself in this difficult branch of learning, that he gained the notice of the celebrated Chevalier Bunsen, who gladly availed himself of B.'s knowledge in the philological portion of *Egypt's Place in Universal History*. The chevalier, in his preface, thankfully acknowledged this assistance in the following terms: 'This English edition owes many valuable remarks and additions to my learned friend, Mr Samuel Birch, particularly in the grammatical, lexicographic, and mythological part. That I have been able to make out of the collection of Egyptian roots, printed in the German edition, a complete hieroglyphical dictionary, is owing to him. To him also belong the references to the monumental evidence for the signification of an Egyptian word, wherever the proof exhibited in Champollion's dictionary or grammar is not clear or satisfactory. . . . The work may now be said to contain the only complete Egyptian grammar and dictionary, as well as the only existing collection and interpretation of all the hieroglyphical signs; in short, all that a general scholar wants, to make himself master of the hieroglyphic system, by studying the monuments.' After Bunsen's decease, B. was engaged to prepare for the press and edit the fifth and concluding volume of *Egypt's Place*, a task which he has performed in an admirable manner, giving the results of all the discoveries made by Egyptologists, since the publication of the first volume, in 1843, down to the present year (1867). B. has also prepared a second edition of the first volume of *Egypt's Place*, published at the same time as vol. 5, and in which the same care has been taken to make the work correspond with the most recent investigations of hieroglyphic scholars. It was by the particular desire of Bunsen, as expressed on his death-bed, that B. undertook the revision of his work on Egypt. B. is now universally recognised as the foremost Egyptologist in this country. In 1844, upon the retirement of Mr Barnewell from the office of assistant-keeper in the department of Antiquities, B. was appointed his successor. In 1861, upon the retirement of Mr Hawkins from the post of keeper of the Antiquities, that department was divided into three separate and independent departments, viz., the department of Oriental, Medieval, and British Antiquities, and Ethnography; the department of Greek and Roman Antiquities; and the department of Coins and Medals. B. was appointed keeper of the first-named collections; but last year, a fourth department was constituted out of these collections, viz., that of British and Medieval Antiquities and Ethnography, at the head of which Mr Franks was placed, the consequence being, that B. is now the keeper only of the Egyptian and Oriental Antiquities. In 1862, B. received the honorary degree of LL.D. from the university of St Andrews. He is a corresponding member of the Institute of France (Académie des Inscriptions et des Belles-Lettres); also of the Academy of Berlin, of the Academy of Herculaneum, and of the Archæological Institute of Rome. B.'s principal publications are as follow: *Gallery of Antiquities selected from the British Museum by F. Arundale and J. Bonomi, with Descriptions by S. Birch* (1842); *Views on the Nile, from Cairo to the Second Cataract, drawn on Stone, from Sketches taken by Owen Jones and J. Goury, with Historical Notices of the Monuments by S. Birch* (1843); *Catalogue of Greek and Etruscan Vases in the British Museum* (1851), drawn up in conjunction with Mr Newton; *An Introduction to the Study of the Egyptian Hieroglyphs,*

contributed to Sir J. Gardner Wilkinson's work, *The Egyptians in the Time of the Pharaohs* (1857); *History of Ancient Pottery* (2 vols. 1858); *Description of the Papyrus of Nas-khem, Priest of Amen-ra, discovered in an Excavation made by direction of H.R.H. the Prince of Wales in a Tomb near Gournah at Thebes* (privately printed by command of the Prince of Wales, 1863). Besides his Egyptian and classical labours, B. has also studied Chinese, and in that direction is author of the following brief contributions, viz., *Analecra Sinensia*, short stories from the Chinese (1841); *The Friends till Death*, a tale translated from the Chinese (1845); and *Chinese Romance—The Elfyn Foxes* (1863). B. has likewise contributed papers to the *Archæologia*, to the *Transactions of the Royal Society of Literature*, the *Revue Archéologique*, the *Archæologische Zeitung*, and the *Zeitschrift für Aegyptische Sprache und Alterthumskunde*. He has also written many articles for the *English Encyclopædia*, principally on subjects connected with Egyptian antiquities and hieroglyphics. In the same class of subjects, he has been a much valued contributor to Chambers's *Encyclopædia*.

BISCEGLIE, a seaport town of Italy, on the Adriatic, in the province of Bari, in the former kingdom of Naples, 21 miles north-west-by-west from Bari. It is built on a rocky promontory, defended by strong fortifications. The port admits only vessels of small burden. B. is a bishop's seat, and has a cathedral, besides two collegiate and several other churches, convents, a seminary, a hospital, &c. Rain-water is collected in public reservoirs, the water-supply being otherwise very insufficient. Pop. (1861) 16,427. Around the town are many fine villas and country-houses. The neighbourhood produces good wine, and has acquired particular celebrity for its currants, which are said to be equal to those of the Ionian Islands. During the Crusades, B. was famous for its hospital, founded by Bohemond, for pilgrims from the Holy Land, of which some ruins still exist.

BISMARCK-SCHOENHAUSEN, GRAF CARL OTTO VON, Prussian prime minister, perhaps at this moment the most prominent man in Europe, was born in 1813 at Brandenburg, of an old family, of which various members have gained a reputation both as soldiers and statesmen. B. received his university education at Göttingen, Berlin, and Greifswald, where he studied law. After he had finished his studies, he lived for a time on his estates. Before 1847, he was little heard of, but about that time he began to attract attention in the Prussian parliament as an ultra-royalist, and an advocate of the extremest absolutism. He was one of those who opposed the scheme of a German Empire, proposed by the German parliament of 1849. His diplomatic career commenced in 1851, when he was appointed chief secretary of the Prussian legation, at the resuscitated German diet at Frankfurt. Here he began to manifest that zeal for the interests and aggrandisement of Prussia, which has since undeviatingly guided him, often regardless of the means. In the diet, he gave open expression to the long-felt discontent with the predominance of Austria, and demanded equal rights for Prussia. In St Petersburg, whither he was sent in 1859, he is said to have tried to bring about an alliance between France, Prussia, and Russia, but without success. By this time he had acquired the special regard and confidence of the king, who sent him, in the spring of 1862, as ambassador to Paris, in order to give him an insight into the politics of the Tuileries, before taking the direction of affairs at home. In autumn, when the king's government could not obtain the consent of the

lower house to the new military organisation, B. was recalled, to take the portfolio of the ministry for Foreign Affairs, and the presidency of the cabinet. Not being able to pass the re-organisation bill and the budget, he closed the chambers (October 1862), announcing to the deputies that the king's government would be obliged to do without their sanction. Accordingly, the army reorganisation went on; and the next four sessions of parliament were closed or dissolved in the same way, without the government obtaining, or even caring to obtain, the sanction of the house. The people were now looking for a *coup d'état*, and the government for a revolution. At this crisis, the death of the king of Denmark opened up again the Slesvig-Holstein question, and excited a fever of national German feeling, which B. was adroit enough to work so as to aggrandise Prussia by the acquisition of the Duchies, and reconcile his opponents to his high-handed policy by being able to point to the success of the newly-modelled army. Throughout the events which ended in the humiliation of Austria and the reorganisation of Germany under the leadership of Prussia (see **GERMANY IN SUPPLEMENT**), B. was the guiding spirit; and such is the magic of success, that from being universally disliked, he has become the most popular man in Germany. What is perhaps still stranger, the man who, of all others living, has been the most strenuous upholder of absolutism, and has all along manifested the strongest contempt for public opinion, recently (May 1867) received the thanks and congratulations of the extreme democrats of Great Britain for giving to North Germany a constitution based on universal suffrage. The truth probably is, that B. never cared for the unification of Germany, on which his popularity among Germans rests; it is more than suspected that he even disliked it. What he did care for was the aggrandisement of Prussia; and the national aspiration for union presented itself as the only means to attain his end. But in order to give this national feeling a fair field of action, it was necessary to swamp the obstructive 'particularism' of the aristocrats and bureaucrats in the petty states by the votes of the people, and hence the democratic constitution of the new German parliament. B. probably saw that thus, and not otherwise, would the leadership of Prussia be real. B.'s personal appearance is that of a man of energy; in social life, he is genial and witty; in the discharge of his public duty, earnest and stern; he possesses a great deal of personal courage, and has shewn himself cool and fearless in battle.

BISULNUGGUR, or **BISANAGAR**, a town of India, in Guzerat, in the territories of the Guicowar. It is situated on the route from Mhow to Deesa, 82 miles north-west of Mhow, and 44 miles south-east of Deesa. It has a considerable transit trade, in sending iron and other heavy goods to Marwar. The manufacture of cotton cloths is carried on to a considerable extent. Pop. 18,000.

BISULPUR, a town of India, in the British district of Bareilly, North-west Provinces. It is 24 miles south-east from Bareilly. It has a good bazaar, and is abundantly supplied with water. Pop. 7245.

BITTENFELD, **HERWARTH VON**, a Prussian general, one of the three leaders that commanded the invasion into Bohemia in 1866. B. was born in 1796, and gained his first martial laurels in the War of Liberation, especially in the battle of Leipzig. In the year 1848, he commanded the first regiment of the Guards. In 1863, raised to the rank of general, he acquired great fame through his daring crossing of the Sund, and capture of the isle of Alsen. In

the campaign of 1866, he was intrusted with the occupation of Saxony, and then with the command of the army which advanced from Saxony into Bohemia, and co-operated with that of Prince Frederick Charles in the advance on Gitschin. He contributed largely to the brilliant victories of Hünnerwasser, Gitschin, Mütchengrätz, and Königgrätz; and stands in the highest favour both with the people and the sovereign, who has conferred on the aged hero the order of the Black Eagle.

BLACKBURN, an inland town of Lancashire, England, 21 miles north-north-west from Manchester, and 12½ miles by railway east-by-south from Preston. It stands on a stream, from which it appears to derive its name, a branch of the Ribble. The surrounding district, formerly known as *Blackburnshire*, or *Blagburnshire*, was long very wild and dreary, but is now very populous. Coal and lime abound in it. B. had acquired some importance as a market-town in the 16th century. Its manufacturing prosperity can be traced back at least to the middle of the 17th c., when it was noted for the production of a kind of linsey-woolsey known by the name of *Blackburn Checks*, afterwards superseded by the *Blackburn Grays*, so called from their being printed unbleached. In the course of the 18th c., the cotton manufacture became the chief industry of the town, which is now one of the chief seats of it, the number of cotton factories being very large, and many of them employing from 1000 to 2000 operatives. The value of the calicos and other cotton goods annually produced was estimated some years ago at nearly £2,000,000 sterling, and is now certainly much more. The steam-power employed in the works for spinning and weaving cotton has been more than doubled within the last 20 years. Many improvements in machinery for the cotton manufacture have been made in B., among which the first place in importance as well as in date must be assigned to the invention of the spinning-jenny, by James Hargreaves (q.v.), a native of the town, in 1767. His invention, however, was regarded with so much popular dislike, that he was compelled to remove from the town, and it was not till the beginning of the present c., that it came into general use in the cotton-works of Blackburn. The pop. of B. in 1851 was 46,536; and in 1861, it had increased to 63,126. It is now (1867) probably about 75,000. A range of hills on the north of the town shelters it from the coldest winds. Many of the streets are spacious, and the town is generally well built. A park of 50 acres, known as the *Corporation Park*, has recently been laid out for public recreation. The most elevated part of this park is about 700 feet above the level of the sea, and commands a very extensive view. The parish church, St Mary's, is a very beautiful Gothic building, erected between 30 and 40 years ago. There are numerous other places of worship, both of the Established Church, and of various denominations of dissenters. The Grammar-school was founded by Queen Elizabeth in 1567; and there are many other educational establishments, and many benevolent and religious institutions. The finest building in the town is the new Exchange, recently erected, in the Gothic style, and containing a magnificent room, 40 yards by 20. The town-hall is also worthy of being mentioned. B. is supplied with water from capacious reservoirs, which have been constructed in the neighbourhood. The Leeds and Liverpool Canal, passing on the south side of the town, affords important facilities for the conveyance of goods; and B. is connected by several railways with all the neighbouring towns, and so with all parts of the kingdom. B. is governed by a mayor, 12 aldermen, and 36 common-councilmen. It sends

two members to parliament, a privilege which it obtained under the Reform Bill of 1832.

BLACK DEATH, THE REGENT, is the title commonly given to a very fatal disease which occurred in Ireland, in an epidemic form, in the years 1866—1867. It is described under the title of **EPIDEMIC CEREBRAL MENINGITIS**.

BLACKPOOL, a flourishing town in the township of Layton-cum-Warbreck, in the county of Lancaster, is now a very considerable place, lying on the coast of the Irish Sea, between the estuaries of the Ribble and the Lune, distant from Poulton-le-Fyde 4 miles, and from Preston 18 miles. The pop. in 1861 was 3506, and since that period it has very considerably increased; but the numbers who resort here during the bathing-season far exceed the permanently resident inhabitants. Upwards of 100,000 visitors annually come from East Lancashire, Manchester, Yorkshire, and other parts of the kingdom. B. is one of the most frequented bathing-places in the west of England, the sands being excellent. It has a branch railway connecting it with the Preston and Wyre Railway, which affords easy access from Preston, Liverpool, Manchester, and all parts of the kingdom. There is also another railway connecting it with Lytham, another favourite bathing-place on the Ribble, about 7 miles to the south. B. has a fine pier stretching out into the sea about 500 yards, which cost £15,000; also another pier, now (1867) in the course of construction, which, when finished, will extend further. There are three established churches, a Roman Catholic chapel, and five other chapels for the Wesleyans, Independents, &c. Besides excellent streets and terraces of houses elegantly built, it has many large hotels (one of which, recently erected, cost upwards of £12,000); there is also a theatre, libraries, news-rooms, &c. There is no trade or manufactures; the lodging-house keepers depend solely on the large concourse of visitors. Fishing is the employment of many during the winter months.

BLANC, LE, a town of France, in the dep. of Indre, on the Creuse, 33 miles west-south-west from Châteauroux. It is beautifully situated, and is a neat and well-built town. It was formerly strongly fortified, but the fortifications are dismantled. Its principal industries are the manufacture of coarse woollen cloths, and tanning. Vinegar is also made here; and there is a considerable trade in the wine of the district, and in iron, fish, wood, and pottery. There are several iron-works in the vicinity. Pop. (1866) 4584.

BLOWING-MACHINES. The earliest blowing-machine was, doubtless, some form of the common bellows, the idea of which is supposed to have been derived from the lungs. A very primitive form of this instrument is still in use in some Eastern countries, consisting simply of the skin of some animal sewed into a rude bag with a valve and nozzle. The older forms of domestic bellows are all constructed on the same principle—viz., a chamber formed of two boards with flexible leather sides, having at one end a nozzle with a narrow mouth; and in the lower board, a valve of considerably larger area for the admission of air. When the bellows are distended by drawing the boards apart, air is sucked in by the valve, to replace the vacuum which would otherwise be formed; and then, when the boards are being closed, the valve, which only opens inwards, is shut by the compressed air; and the latter, having no other escape, is forced out at the nozzle.

The great fault of the common bellows is, that it gives a succession of puffs, and not a continuous blast. One remedy for this was to use two bellows, so that one was blowing while the other was filling;

but it was afterwards found that the double-bellows secured a still more uniform blast. This machine, shewn in fig. 1, is merely the common bellows with

Fig. 1.—Section of Double-bellows for a Portable Forge.

a third board of the same shape as the other two placed between them, so as to form two chambers instead of one. The middle board is fixed, and both it and the lower one have valves placed in them opening inward. A weight on the lower board keeps the under chamber filled with air; and when this board is raised by a lever or otherwise, the air which it contains is forced into the upper chamber. The exit-pipe is attached to the latter, and a weight is placed on the upper board sufficiently heavy to press the air out in a continuous stream, the continuity being maintained by the large quantity of air always present in the upper chamber, and the uniform pressure of the weight. Sometimes a spring is used instead of a weight to press out the air. Even with the double-bellows, however, the constant refilling of the upper portion from the lower prevents the blast from being quite regular.

For such purposes as the supplying of a continuous stream of air to a flame for glass-blowing or soldering, a very convenient form of apparatus has been constructed by Mr P. Stevenson of Edinburgh, which the diagrams (figs. 2 and 3) will explain. By means of the common bellows worked by a treadle,

Fig. 2.

Fig. 3.

air is blown into the lower portion of a small cylinder containing a quantity of water, and having a diaphragm in the middle of the height, with a wide pipe reaching nearly to the bottom. When the apparatus is at rest, the water remains below the diaphragm, as shewn in fig. 2; but when air is blown in, it gradually rises through the pipe to the position shewn in fig. 3. The water as it descends then presses out the air in a steady stream by the exit-pipe, as a valve prevents it returning to the bellows.

BLOWING-MACHINES.

Bellows made entirely of wood except the nozzle, first made in Germany in the 16th c., are in use in some continental countries. They are usually of large size, and the contrivance consists in having two boxes, of which the sides of the upper enclose those of the lower, so that the former can move up and down on the latter without admitting air except by a valve, as in the common bellows, of which, in fact, they are only a modification.

The Chinese have a very simple form of bellows, shewn in fig. 4, which is not only interesting in

Fig. 4.—Chinese Bellows.

itself, but also because its action is almost the same as the blowing-engine. It is merely a square chamber of wood, with a close-fitting piston, which, when drawn from the nozzle, opens the valves *v, v*, to admit air, and when pushed in the opposite direction, shuts these valves, and forces the air out by the nozzle.

For blowing a domestic fire in a chimney, the most effective contrivance is a metal screen to close the front of the aperture above the grate, so that the supply of air must all pass through the fire. This kind of blower, however, will only act when the fire is already producing as much heat as to cause a sensible draught up the chimney.

For smelting and refining furnaces, where a blast with a pressure of 3 or 4 lbs. per square inch is required, blowing-engines of large size are usually employed. In our article IRON, this kind of engine is referred to, and a small figure of one given; but we shall here describe the blowing apparatus itself more in detail. A blowing-engine consists, as shewn in fig. 1, article IRON, of a steam-engine, with the ordinary steam-cylinder at one end, and a blast-cylinder at the other end of the beam. Such, at least, is the construction preferred for the larger-sized engines; but sometimes a horizontal arrangement of the cylinders is adopted for those of smaller size. The blowing-cylinder, X, shewn in fig. 5, is of cast-iron, with an air-tight piston, P, which, as it ascends and descends with the motion of the engine, alternately inhales and expels the air at each end. To effect this, a series of valves are provided, and these are arranged as follows: Inlet valves are placed on the top of the cylinder at A, and also on three sides of the box at B, but on the fourth side of this box there are two outlet valves at C. These valves consist of numerous openings, against which leather flaps lie when they are shut. Valves of a similar nature are placed at the bottom of the cylinder; those for the inlet of air at D, E, and F; and those for outlet at G. When the piston descends, it would create a vacuum in the upper portion of the cylinder, provided there were no openings in it; but the external air pressing on the inlet valves, opens them, and fills the space above the piston; at the same time, the outlet valves at C, which only open outwards, are tightly closed by the air pressing inwards from the pipe M. Again, when the piston ascends, it compresses the air above it, and exactly reverses the action of the valves; that is to say, it shuts the inlet valves at A and B, opens the valves at C, and allows the compressed air to pass along the outlet pipe M, which is made of large size, so as to offer as little resistance as possible to the passage of the air. The valves at the bottom of the cylinder work exactly in the same way, the inlet valves, D, E, and F, opening when the piston ascends, and shutting when it descends, thus compelling the inhaled air to pass into the pipe M by the lower outlet

valves at G. The air is conducted by the pipe M into a receiver of large capacity, which serves to equalise the blast before it passes to the tuyeres. See IRON, fig. 1.

A blast-engine at Shelton Iron-works, of which the blowing-cylinder is 8 feet 4 inches in diameter, and has a 9-foot stroke (represented in fig. 5), working with 186 horse-power, and making 32 single strokes of the piston per minute, inhales 15,700 cubic feet of atmospheric air per minute; but this is compressed by the blowing-cylinder to a pressure of 3 lbs. per square inch above the atmosphere, which reduces the volume supplied by the cylinder to 13,083 cubic feet. Its volume, however, is largely increased again, when raised to the hot-blast temperature, before entering the furnace. Much valuable information respecting blowing-engines and blast apparatus will be found in Dr Percy's large

Fig. 5.—Section of a Blowing Cylinder, Shelton Iron-works, Stoke-upon-Trent.

work on Metallurgy, vol. ii., from which the above figure is taken.

In the Catalan forges of Spain and the south of France, there is a very ingenious water-blowing machine in use called a *Trompe*; but it can only be advantageously employed where a fall of a few yards of water is available. Its construction will be understood by an inspection of fig. 6. A strong wooden cistern, C, to act as a reservoir for the water; wooden pipes, P (generally two in number), through which it descends; and a wind-chest, W, to allow the air and water to separate, constitute the essential parts of the apparatus. It is put in operation by lifting the wedge *v* with a lever; this allows the water to rush down the pipe, and in doing so, it draws in air through sloping holes, *a, a*, called aspirators, at the throat of the pipe. A continuous current of water and air is thus supplied to the wind-chest, which is provided with an opening at *o* for the escape of the water, while the air passes out in a regular stream by the nozzle-pipe at *n*. The height from which the water falls determines the tension of the blast; but the height seldom exceeds

BLOWING-MACHINES.

27 feet, which gives a pressure of from $1\frac{1}{2}$ to 2 lbs. to the square inch. It is asserted that no other blowing-machine gives so equable a blast as the trompe, and it is the least costly of any; but it has the serious defect of supplying air more or less saturated with moisture. The theory of this singular machine has never been satisfactorily explained, although one or two able philosophers, who have specially studied the matter, incline to

Fig. 6.—Trompe, or Water-blowing Machine (vertical section).

the belief that much of the air is carried down the pipe by becoming entangled in water. It is found that the separation of the air from the water is greatly promoted by allowing the falling current to impinge on a narrow platform at *p*.

The fan, or Fanners (q. v.), as it is sometimes called, is another machine of great value for producing currents of air. It has long been in use as a winnowing-machine for agricultural purposes, and also for creating a blast to melt pig-iron in foundries. More recently, it has been employed instead of bellows in smithies, on account of its greater convenience and the steadier blast which it yields. A domestic bellows has even been introduced on the fan principle. The fan is also much used in the ventilation of buildings, ships, and mines. For the last, it is now considered preferable to the plan of furnace-ventilation, especially where there are fiery seams of coal.

In its construction, the fan is like a wheel, having the arms tipped with vanes, instead of being joined by a rim. It is placed inside a chest—usually in

an eccentric position—with openings on each side round the spindle for the admission of air. The motion is given by steam or other power; and as it revolves, the centrifugal action sucks in air at the centre, draws it towards the tips of the vanes, and

Fig. 7.—Fan (vertical section).

these impel it forward through the exit-pipe. Fig. 7 represents a vertical section, and fig. 8, a plan of a blowing-fan, in which *v, v, v* are the four vanes; *o*, one of the central openings; *c*, the chest or fan-case; and *e*, the exit-pipe. Engineers differ as to the proportions which should be adopted for the fan, and as to the extent of spiral which the fan-case should have. For foundries and smithies where the pressure of the blast required is from four to five ounces per square inch, the following have been found to suit very well in practice: the width of the vanes, as well as their length, made one-fourth of the diameter of the fan; the inlet openings in the sides of the fan-chest, one-half, and the degree of eccentricity, one-tenth of this diameter. There is a segmental slide shewn at *s* in fig. 7, by which the opening into the delivery-pipe may be increased or diminished. For

Fig. 8.—Fan (horizontal section).

such purposes, fans vary from 3 to 6 feet in diameter, and they are entirely constructed of iron. Double fans have been introduced by Mr Chaplin in England, and by M. Perrigault in France. In these, two simple fans are so disposed on one spindle that the blast produced by one passes in its compressed state through a tube to the other, which largely augments the working pressure. In Platt and Schiele's silent fan, the air enters by a central entrance at one side only, and is expelled from the case at the opposite side. The vanes are a peculiar shape, and describe what the inventor (Schiele) calls an antifriction curve. It is said to be very efficient, and so also is another form of noiseless fan by Mr George Lloyd, London.

For the use of the fan in ventilation, see that head. In some cases, fans are of large size; some also are of peculiar construction. Agricultural fans (see FANNERS) are not usually placed in an eccentric position in their cases, and only some kinds of ventilating fans are. One of the happiest applications of the fan has been to draw off and render harmless

the fine steel dust in the operation of needle-grinding. It has been lately employed to recover the waste gases in blast furnaces. A hot-air fan of an ingenious kind has been introduced for heating and drying purposes by Mr J. R. Davidson, London.

A modified form of the fan, called a *centrifugal disc*, patented by Mr Rammell (Patent No. 2718, Nov. 1860), has been successfully employed by the Pneumatic Dispatch Company for the transmission of the mail-bags. See PNEUMATIC DISPATCH. This machine can also be used to produce a blast, to raise water, and to propel vessels.

In the Paris Exhibition of this year (1867), there is an excellent blowing-machine, something on the principle of the fan, by Messrs Roots of Connersville, U. S. It is thus described in the *Engineer* for August 23, 1867: 'A pair of horizontal shafts, geared together at both ends, traverse a case of the form of two semi-cylinders, separated by a rectangle equal in depth to the diameter of the semi-cylinders, and in width to the distance between the centres of the shafts. . . . These shafts carry a pair of solid arms, each having a section somewhat resembling a figure of eight, the action of which, as they revolve, takes the air in by an aperture at the bottom of the machine, and expels it with considerable pressure, if required, at the top.' Fig. 9 will further explain

Fig. 9.—Roots' Blowing-machine.

the construction of this machine. It gives a much greater pressure of blast than is attainable by the fan.

For the purposes of ventilation, and also for expelling accumulations of hot air, dust, waste flyings, &c., in factories, a machine has been constructed by Mr J. Howorth, Farnworth, Bolton, called a *revolving Archimedean screw-ventilator*. It consists of an Archimedean screw enclosed in a tube with proper means of lubrication. Its diameter is 30 inches, and it is made to be set in motion by steam or other power, but it is also furnished with a hood, on the top of which there are curved vanes, which turn the screw by the action of the wind. Immediately beneath these, there is another series of lateral vanes for the escape of the hot air.

BLUEFISH (*Temnodon saltator*), a fish of the family *Scomberidae*, of a genus having no detached finlets, no isolated dorsal spines, and no lateral armature of the tail, two dorsal fins, the first of which is small, and two deeply-hidden spines in front of the anal fin. The only known species is a native of the east coast both of North and South America. The upper parts are of a bluish colour, the lower parts whitish, a large black spot at the base of the pectoral fins. The mouth is crowded with teeth, the jaws are furnished with large ones. The B. preys on other fishes, as the weak-fish, menhaden, and mackerel, the shoals of which it pursues. It is very swift, strong, and voracious.

It sometimes attains a length of three feet, and a weight of 14 lbs. It is much esteemed for the table, and great numbers are brought to market in New York, Philadelphia, and other towns about the end of summer. It is often caught by trolling, as it bites readily at any object drawn swiftly through the water. It frequently ascends rivers even to fresh water.

BOATBILL (*Cancroma cochlearia*), a bird of the Heron (q. v.) family, the only known species of a genus differing from the true herons in little else

Boatbill (*Cancroma cochlearia*).

than the form of the bill, which is comparatively short, and very broad, the mandibles resembling the bowls of two spoons placed one upon the other, the upper mandible overlapping the lower, keeled on its upper ridge, and hooked at the point. The B. is about the size of a domestic fowl, has shorter limbs than most of the herons, but resembles them in plumage, and is abundantly provided with elongated feathers on the back of the head and neck, which it erects when irritated. Its general colour is rusty red, the forehead and breast whitish. It inhabits Cayenne, Surinam, Brazil, &c., sits perched upon trees which hang over streams, and darts down upon fish, which seem to be its principal food.

BODE, THE BARONS DE, a family of doubtful nationality, best known in England in connection with a claim for indemnity frequently brought before parliament. The first member of the family connected with England was CHARLES A. L. F. DE B., a baron of the Holy Roman Empire. He was born at Neuhoef, in Germany, in 1741, and became an officer in the regiment of Nassau, which, although in the service of France, consisted exclusively of Germans. The baron had landed property in Germany, and remained German when he married a Miss Kennerley, an Englishwoman. Two years afterwards, a son was born of the marriage at Locksley, in Staffordshire, named CLEMENT J. P. de B., who returned when a child with his parents to the continent. In 1787, Baron Charles purchased an estate in Lower Alsace, held under German feudal tenures, in terms of the treaty of Münster, and thither he went to reside. The Revolution, however, broke out, and in 1791 the baron considered it prudent publicly to surrender his estates to his son. Two years later, the family was obliged to emigrate, and the property was confiscated. After leaving France, Baron Charles bought a fief held of the Archbishop of Cologne, and he died a German in 1797. Clement, his son,

became an officer in the Russian artillery, married a Russian, and, with his regiment, entered Paris in 1814. After the peace, conventions were entered into, under which British residents who had suffered during the Revolution by confiscation were to be indemnified. A large sum was handed over by France to England, to be divided among the claimants, one of whom was Baron Clement. The fact that he had been invested as proprietor of the estate in Alsace at the time of confiscation, that his mother was English, and that he had been born in England, secured at first a recognition of his claim to the extent of making it an item of the calculation for fixing the amount of the indemnity; but it was afterwards repudiated, on the ground, that Baron Clement was not an English subject at the time of confiscation, and that he had sustained no loss through his connection with England. He died in 1846. His son, BARON CLEMENT A. G. P. L., took out letters of administration to his father, and prosecuted the claim of his family; until now, however, without much success. He petitioned the House of Commons in 1852, and his case was fully discussed. See J. Hodgkin's *Case of the Baron de B. in its Present Aspect* (1860). Baron Clement is naturalised as a British subject, and has married an Englishwoman. He has acquired reputation as an Eastern traveller, and is the translator of *Bokhara, its Emir and People*, from the Russian of Khanikoff (1845), and the author of *Travels in Lauristan and Arabistan* (1845), and of an interesting *Account of Hilly Daghestan and the Lezghi Tribes of the Eastern Caucasus*, referred to with approbation by Earl de Grey in his address to the Geographical Society in 1860.

BOEHMERIA. The China-grass plant, *B. nivea*, has recently been introduced into cultivation in some of the southern parts of the United States, under its Malay name of *Ramee*. It succeeds well, and the results as to produce of fibre have proved very encouraging.

BOISSONADE, JOHN FRANCIS, a distinguished classical scholar, born at Paris, August 12, 1774, of a noble Gascon family. He was originally intended for the administrative career, but after experiencing some of its more violent vicissitudes, he renounced it for philology, in which he had always found his favourite recreation. He soon made himself known to the critical world by his acute and learned contributions to the literary journals, was appointed Professor of Greek in the Academy of Paris in 1809, and entered on the active duties of the chair in 1812. In 1813, he was admitted into the Academy of Inscriptions; and in 1828 he succeeded Gail as Professor of Greek Literature in the College of France. Beyond this high position he never aspired, but pursued his investigations with an energy which no mere social or public ambition could distract. His more important works are these: *Philostrati Heroica* (Paris, 1806); *Marini Vita Procli* (Leip. 1814); *Tiberius Rhetor de Figuris* (Lond. 1815); *Sylloge Poetarum Græcorum* (Paris, 1823—1826); *Babrii Fabula* (Paris, 1844); &c. He contributed in his earlier years numerous papers on philological subjects to Parisian, English, and German journals, and gave the cause of classical study in France a powerful and still perceptible impulse by his eloquent and attractive lectures from his chair. In spite of his many and laborious philological works, he also signalised himself as a French lexicographer and belle-lettrist, and was one of the most copious and valued contributors to the *Biographie Universelle*. He died in 1859, leaving behind him a reputation for learning almost German in its profundity, and more than English in its elegance.

BOLI, or **BOLY**, a town of Asia Minor, in the pashalic of Anatolia, on the left bank of the river Boli, and on or near the site of the Roman Hadrianopolis, 136 miles east from Constantinople. The town occupies an eminence, at the extremity of a fertile plain. It has several mosques. There are mineral springs near the town, and baths much frequented by the Turks. B. is on the caravan route from Constantinople to Erzeroum. Pop. 6000.

BOLSWA'RD (Lat. *Bolwerda*), an old town in the Netherlands, province of Friesland, lies 15 miles south-west from Leeuwarden. It is surrounded by a high earthen wall and broad canal. The church of St Martin, in the Gothic style, is the largest and handsomest in Friesland. There are several benevolent institutions, and a grammar-school. The trade is chiefly in butter, cheese, and cattle. Ship-building, tanning leather, making brick and coarse pottery, spinning worsted, carding wool, &c., are the principal industries. In 1864, pop. 4617.

BOM JARDIM (i. e., Good Garden), a town of Brazil, in the province of Ceara, 20 miles south-by-east from Crato, in a rich and beautiful mountain valley. It is the centre of an extensive district, yielding mandioc, sugar, &c. Pop. 6000.

BONILLO, a town of Spain, in the province of Albacete, and 34 miles west-north-west from Albacete. Pop. 5980.

BONYHAD, or **BONHARD**, a market-town of Hungary, in the county of Tolna, 20 miles north-east from Fünfkirchen. Pop. 5340.

BO'RA SA'MBA, a curious little half-independent state, or raj, in India, within the jurisdiction of the political agent for the south-west frontier of Bengal. Its central point is in N. lat. 20° 55', E. long. 83° 10'; its area is about 622 sq. m.; the pop. is estimated at 28,000. The country is rugged, and the people savage. Outlaws from other parts of India have too often found refuge here. The revenue is about £400 a year. A tribute of £16 is paid to the British government.

BORGETTO, a town of Sicily, in the province of Palermo, and 13 miles west-south-west from Palermo. It is a long straggling town, of mean houses, but picturesquely situated on a wooded cliff overhanging a plain, and itself overhung by a lofty precipice of red rock. Pop. (1861) 5977.

BORGOMANERO, a town of North Italy, in the province of Novara, and 19 miles north-north-west from Novara, situated near the left bank of the Agogna. It is a walled town, well built, and contains a communal college and an hospital. It has little trade. Pop. (1861) 4604.

BO'RGIO SAN DONI'NO, a city of North Italy, in the province of Parma, situated in a plain, 14 miles north-west from Parma, on the railway between Parma and Piacenza. It is surrounded by walls, has several good streets, is an episcopal see, and has a cathedral (the oldest part of which is in the Lombard style), several churches, and several educational institutions. Manufactures of silken, linen, and woollen fabrics are carried on; and oil and wine are produced in considerable quantities. The city derives its name from a saint, who is said to have been a soldier in the army of the Emperor Maximian, and to have suffered martyrdom here. The shrine of St Donino has long been one of the most frequented in Italy. There are some curious remains of very rude medieval sculpture in the cathedral. Pop. (1861) 4119.

BORGOTARO, a town of North Italy, in the province of Parma, and 35 miles south-west from Parma, on the left bank of the Taro, a tributary of

the Po. It is encircled by walls, and is well built. Pop. (including commune) 6938. The surrounding district is hilly and wooded.

BOROVITCHI, a town of Russia, in the government of Novgorod, 98 miles east of the town of Novgorod, on both sides of the river Msta, near some rapids. Pop. 8706. Its situation on the great canal and river water-way which connects the Volga with Lake Ladoga, renders it of considerable commercial importance.

BO'RZNA, a town of Russia, in the government of Tchernigov, 50 miles south-east of the town of Tchernigov. Pop. 5341.

BO'SCO REA'LE, a town of South Italy, in the province of Naples, at the south base of Mount Vesuvius, 10 miles east-south-east of Naples city. It contains several churches and convents. Pop. (1861) 4553. Good wine is produced in the neighbourhood, and much silk. This town was in imminent danger of destruction by the eruption of Vesuvius in 1850, when a stream of lava advanced towards it with a front of about a mile and a half broad, and a depth of about 12 feet, enveloped the town, and consumed the wood on both sides of it, in which were many magnificent oak, ilex, and ash trees. The larger trees, as they were enveloped in the lava, poured out jets of hissing steam from every knot and branch, and then exploded with a loud noise, leaping into the air to the height of 10 or 20 feet.

BOUCICAULT, **DION**, dramatic author and actor, was born at Dublin on the 26th of December 1822. He was brought up under the guardianship of Dr Dionysius Lardner, the well-known popular writer on science, and was educated at University College, London. He produced his first dramatic work very early—before he was 19 years old. It was signally successful, and its success determined his career. This was *London Assurance*. It was first performed at Covent Garden Theatre in March 1841; and it has ever since remained a favourite with playgoers, both throughout Great Britain and in America. Much of the success it had in London must be ascribed to the admirable acting of Mr Charles Mathews; but it had merits of its own sufficient to secure to it the favourable verdict of the public. The plot was slight, but ingenious; it abounded in comic situations; the dialogue was brisk and sprightly; there was no lack of wit, and there was perhaps somewhat too much of those flippancies and pleasant impertinences which average theatre-goers prefer to wit. Once embarked in the career of a play-writer, B. produced piece after piece in rapid succession, and greatly increased the reputation which his first attempt had brought him. *Old Heads and Young Hearts*, *Love in a Maze*, *Used Up*, *Louis XI.*, and *The Corsican Brothers* were among the most popular of his early works. Several of these are still stock pieces at our theatres; and to playgoers, the mere enumeration of their names will shew that B. distinguished himself equally in comedy, farce, and melodrama. When he went upon the stage, as he soon did, he added a high reputation as an actor to the reputation he had previously gained as an author. From 1853 till 1860, he was in America, where his popularity was scarcely less than it had been in England. On his return to England in 1860, he produced at the Adelphi Theatre, a play, *The Colleen Bawn*, which proved among the most successful of modern times, and which, if not the first of a new school, has at least supplied a new descriptive name to our dramatic literature. *The Colleen Bawn* was, happily enough, described as a 'sensation drama;' its interest depended largely upon scenery, mainly upon

startling incidents and astounding stage-effects. It was not a high kind of work, or fit to stand the tests of a good dramatic piece, as nobody knew better than the author; but it suited the public taste, and the author made a fortune by it. It has been performed at almost every theatre in the United Kingdom; it had a great run in America too; it was even translated into French, and brought out at the Ambigu Theatre at Paris. Mr B. subsequently produced at the Adelphi—of which he was for some time joint-manager with Mr B. Webster—another 'sensation' drama, *The Octoroon*, the popularity of which was only inferior to that of *The Colleen Bawn*. Having quarrelled with Mr Webster, he, in 1862, opened a new theatre in London, the Westminster, erected on the site of what had been for generations known as Astley's Amphitheatre; but this speculation turned out unfortunate, and B. was ruined by it. He has since, however, re-established his fortunes by new plays, brought out at the Princess's, the Holborn, and other theatres, in some of which he and his wife—formerly Miss Robertson, a very popular actress—took the leading parts. *The Streets of London* and *Flying Scud* have been the most popular of his recent works, all of which are of the 'sensation' school, with which, it may be said, he first familiarised the public. He has written upwards of 150 dramatic pieces; and in illustration of the facility with which he has composed works which—all deductions made—are of considerable merit, it may be said that he lately stated to a royal commission that he would undertake to write plays for all the theatres in London. He is undoubtedly capable of writing better works than any he has yet written; but he found the public taste bad, and instead of making thankless attempts at improving it, he has been content to gratify it; and in fact has helped to debauch it. As an actor, B. has always been popular, without attaining to high excellence in his vocation. He wants some natural gifts, without which a man cannot be a great actor: he has an immobile countenance, an indifferent voice, and a too artificial manner. Any success he has had has been gained by the soundness of his judgment, his great cleverness, and his intimate knowledge of stage business.

BOU'FARIK, a village of Algeria, in the province of Algiers, and 16 miles south of Algiers. It is an important military station on the road from Algiers to Blidah and Oran. It has well-frequented markets, and a considerable trade in corn, cotton, olives, oranges, tobacco, raisins, and cattle. Pop. 5100.

BOUVA'RDIA, a genus of plants of the natural order *Cinchonaceæ* (q. v.), and of the same tribe with the *Cinchona* (q. v.), or Peruvian Bark. The calyx is 4-partite, with teeth between the segments; the corolla tubular and 4-fid; the stamens 4, included within the corolla; the capsule 2-celled. The species are natives of Mexico. One of them, *B. triphylla*, with oblong ternate leaves and trigonous branches, has obtained a place among the favourite ornaments of flower-borders in Britain, but requires careful protection from frost. To preserve it, the roots are generally taken up, and are sometimes placed in a greenhouse or frame for the winter, sometimes in a dry cellar. Its beautiful corymbs of scarlet flowers are produced from June till November.

BRADDON, **MISS MARY ELIZABETH**, one of the most popular novelists of the day, was born in London in the year 1837. Her father, Mr Henry Braddon, was a solicitor. She very early shewed a turn for literature, which she indulged in the usual manner, by sending verses and other trifles to the

magazines and newspapers. In 1860, she essayed a somewhat more sustained effort in a little *com-medietta* called *The Loves of Arcadia*, which was brought out at the Strand Theatre; and the year after, she published a volume of verse entitled *Garibaldi and other Poems*. Neither these, however, nor the tales which she now began to issue through the medium of the *Temple Bar* and *St James's Magazine*—*Lady Lisle*, *The Captain of the Vulture*, *Ralph the Bailiff*, &c.—in any decisive way succeeded in drawing to her the attention of the public. Her first great success came with the publication, in 1862, of *Lady Audley's Secret*, which instantly attained a great popularity. This has since been extended by the appearance of *Aurora Floyd*, *Eleanor's Victory*, *John Marchmont's Legacy*, *Henry Dunbar*, *The Trail of the Serpent*, *The Ladies' Mile*, *Sir Jasper's Tenant*, *Only a Clod*, *The Doctor's Wife*, and *Rupert Godwin*. Than these, whatever may be judged their exact merits, few books of the period have secured a wider circle of readers. They mainly depend for their interest on good bold effects, of what is termed, in the slang of the day, *sensation*, and the art of their appeal to 'that low vice curiosity' in the conduct of a story, carefully leading up to some suspended and unforeseen *dénouement*. In their particular way, though without much claim to attention as regards either character or sentiment, they display undoubted talent: in style, they are fresh and vigorous, and their narrative power strongly excites the reader's interest. Miss B. is still in uninterrupted literary activity; and as her facility of production is great, she will probably continue to produce books in rapid succession, so long as the public continues to read them, as now, with avidity.

B R A Y, **MRS ANNA ELIZA**, an authoress, is daughter of the late John Kempe, Esq., of the New Kent Road, Surrey, and was born towards the end of last century. At an early age, she shewed much of the imaginative faculty, and a taste for design, which latter brought her the acquaintance of the celebrated Mr Stothard, R.A. From Stothard she took lessons in drawing; and in February 1818, married his second son, Charles Alfred Stothard, also an artist, and author of a well-known work entitled *The Monumental Effigies of Great Britain, selected from our Cathedrals and Churches*, &c. In July 1818, she accompanied her husband to France. Their tour and residence in France lasted until about the middle of November in the same year; and Mrs Stothard wrote an agreeable and lively account of her first foreign experiences, under the title of *Letters written during a Tour through Normandy, Brittany, and other parts of France*, in 1818, with *Numerous Engravings after Drawings by C. Stothard, F.S.A.* (Lond. 1820, 4to). Subsequently, Mrs Stothard accompanied her husband on a similar tour in the Netherlands. In May 1821, however, she had the severe misfortune to lose her husband, who was killed by falling from a ladder. In 1823, Mrs Stothard wrote a life of her husband, entitled *Memoirs, including Journals, Letters, Papers, and Antiquarian Tracts of the late C. A. Stothard, with Connective Notices of his Life, and some Account of a Journey in the Netherlands*. Distress of mind brought on ill health, and Mrs Stothard suffered from an affection of the eyes, which obliged her to give up literary labour altogether for more than two years. In 1825, she married the Rev. E. A. Bray, vicar of Tavistock; and in the following year, published a historical romance entitled *De Foix*, which she had begun during her first husband's lifetime. The idea of this romance was conceived during the tour in Normandy; and similarly, that of her second

romance, *The White Hoods*, during her tour in the Low Countries. This was published in 1828, and was followed by *The Protestant*, also in 1828; *Fitz of Fitz-Ford, a Legend of Devon* (1830); *The Talba, or Moor of Portugal* (1830); *Warleigh, or the Fatal Oak, a Legend of Devon* (1834); *Trelawny of Trelawne, or the Prophecy, a Legend of Cornwall* (1837); *Trials of the Heart* (1839); *Henry De Pomeroy* (1842); and *Courtenay of Walredon, a Romance of the West* (1844). A collective edition of all these romances was published in ten volumes in 1845, with a 'general preface,' in which the writer mentions the circumstances under which each was produced. Mrs B. is also author of *The Borders of the Tamar and the Tavy* (1836), *The Mountains and Lakes of Switzerland* (1841), *Trials of Domestic Life* (3 vols. 1848), *Life of Thomas Stothard, R.A.* (1851), *A Peep at the Pixies* (1854), and *Händel, his Life, Personal and Professional, with Thoughts on Sacred Music* (1857). In July 1857, Mrs B.'s husband died; and in 1859, she published *Poetical Remains, Social, Sacred, and Miscellaneous, of the late Edward Atkins Bray, selected and edited with a Memoir of the Author, by Mrs Bray* (2 vols.). We are not aware that anything has issued from Mrs B.'s pen since this publication.

BRAY, a maritime town, situated partly in the county of Dublin, partly in that of Wicklow, 13 miles south-east from Dublin, with which city it is connected by two different lines of railway—the Dublin, Kingstown, and Bray Railway, and the Dublin, Wicklow, and Wexford Railway. The pop. in 1861 was 4182, of whom 3455 were Roman Catholics, 665 Protestants of the Established Church, and the rest of other denominations. Some years since, B. was a small and unimportant fishing-village; but the beauty of its situation, and the facilities of access to Dublin, have made it a popular watering-place, as well as a favourite position for villa residences; and under the enterprise of a few active proprietors and speculators, it has not only grown in its dimensions, but the extensions have been carried out with excellent taste and spirit. The most striking buildings are the new hotels, and a spacious and highly decorated Turkish bath. The affairs of the municipality are administered by town commissioners.

BRAZIL CABBAGE, or **CHOU CARAÏBE** (*Caladium sagittifolium*, or *Xanthosoma sagittifolia*), a plant of the natural order *Araceae*, nearly allied to *Cocco* (q. v.), and very similar to it, although it differs in having arrow-shaped pointed leaves. It is supposed to be originally a native of tropical America, but is now in common cultivation throughout the whole tropics; not only the root being used for food like that of *cocco*, but also the leaves, boiled as greens. Both root and leaves are almost entirely destitute of the acidity so generally characteristic of the order.

BREECH-LOADING ARMS AND NEEDLE-GUNS. To be loaded at the breech, and to be fired by the penetration of a needle into a detonating cap within the cartridge, are distinct attributes in a weapon; and although the latter system has only been before the public for about thirty years, systems for breech-loading have been tried, accepted, and abandoned without number during the last three centuries. Indeed, a sort of instinct dictates that loading at the breech is the preferable course; and all the earliest muskets were so made, the system being doubtless abandoned from the difficulty of accurately closing the breech, in those days of rough workmanship. The extraordinary efficacy of these principles, especially in combination, have, however, only been very prominent

BREACH-LOADING ARMS AND NEEDLE-GUNS.

during the wars of the last few years, and notably in the Prussian campaigns of 1864 against Denmark, and of 1866 against Austria. The successes of the Prussian arms were attributed in no small degree to the rapidity with which their troops could fire as compared with the enemy. They had, in greater or less numbers, borne these same rifles since 1835, but these were the first opportunities of using them in warfare. To all the other powers, whose men still carried muzzle-loading rifles, and who had debated, without practical result, for years past the question of armament with breech-loaders, soldiers thus armed appeared irresistible. From July 1866 to the present moment, the hammer and the anvil have been busy night and day throughout the civilised world in making the weapons of death yet more deadly. Scarcely two countries seem to have adopted the same plan: each nation has elaborated a system from among its own inventors. Those possessing no great reserve of rifles have prepared new arms; but the majority of governments have been content, in the first instance, to convert their existing stock into needle-firing breech-loaders of as good a construction as circumstances would permit. Thus, Britain, after offering a handsome prize for the best design, selected one said (subject to some controversy) to be the invention of the late Mr Snider.* As this weapon has been produced already to the number of nearly a quarter of a million, and as it has confirmed the favourable auguries entertained of it by accuracy of fire, and by loading thrice to the muzzle-loader's once, much of the following article will be devoted to a consideration of it. At the same time, it is to be borne in mind that the British government only regards the Snider arm as a make-shift, reserving to itself the ultimate selection of a pattern on which to manufacture new weapons. It is not to be understood from the foregoing paragraph that Britain adopted a breech-loading arm in a sort of panic after the battle of Sadowa. It was after the Danish campaign, on the 11th July 1864, that it was decided as an abstract question to arm the British infantry with breech-loaders; a portion of the cavalry having for nearly ten years past been armed with Sharp and Terry carbines, loading at the breech. The selection of an arm took longer; but by the beginning of 1855 it had been decided to convert our great stock of rifles on the 'Snider' system.

Breech-loading.—The advantage of breech-loading is obvious: to be able to insert the charge at the head of the barrel instead of at its mouth, is to save time, and to avoid exposure to hostile fire during the operation of loading and ramming home, which of necessity involves considerable outstretching of the limbs. The great condition of success is, that the bullet shall be propelled with equal force, and with equal safety to the rifleman, as from the muzzle-loader.

* The originality of the invention, though claimed by Mr Jacob Snider, was disputed on behalf of Mr F. E. Schneider, and also of a Cornishman, Mr John Poad Drake. Really, there was little originality about it, for there are in the Tower armoury two muskets with a breech apparatus scarcely perceptibly different from the present gun. However, the War Department recognised substantially Mr Snider's claim, and paid him—or his representatives, for he died October 25, 1866—a reward of £14,500 for his ingenuity; while a small sum was paid to a Mr Wilson in consideration of some share he had in the invention. There was a controversy between Snider and the government; but it hinged not on any refusal to admit his claim as inventor, but rather on legal doubts, occasioned by money difficulties, as to the person capable of giving a valid acquittance. Snider died before this question was definitively settled.

When a charge is ignited, the constituents of the gunpowder, assuming a gaseous condition under the heat engendered, expand into a volume of light gas many times greater in bulk than the powder before occupied. On the amount of this expansion, and its sudden action on the projectile, the force of the shot depends. Any joint in the breech-piece through which a portion of this gas can escape, without having imparted its thrust to the ball, tends, therefore, to lessen the range and penetration; while the shock of the explosion falling more severely on this than on any other part of the barrel, tends yet more to dislocate the breech-piece, and diminish the closeness of the joint's fit. In weapons which do not call for a long range, as revolver pistols, a perceptible interval is left between the chamber and barrel, through which much gas escapes; but in rifles, which have range and penetration as principal objects, there is *prima facie* ground for preferring a muzzle-loader. The gas, however, is far from pure as generated in the barrel, for much water is produced and held in suspension, while there is also a solid residuum consisting of unburned materials of the powder. In the muzzle-loader, these clog (or, technically, foul) the barrel, filling the grooves, and rendering the ramming home of succeeding charges more and more difficult. The effect is, that a solid mass of unburned matter is gradually forced by ramming into the head of the barrel, destroying the accuracy and usefulness of the weapon. In the breech-loader, this solid deposit must be provided against both ways. The backward throw on firing (for, of course, the charge explodes with equal power in every direction) tends to force it into the mechanism of the joints, preventing their proper fit, and continually augmenting the escape of gas. On the other hand, the deposit is prevented from accumulating in the barrel by the fact, that succeeding charges are inserted behind it, and, by their explosion, force the solid matters out at the muzzle. Thus, in the matter of fouling, if the gases can be prevented from blocking up the breech-apparatus, the breech-loader has a great advantage over the muzzle-loader. This protection of the breech-apparatus is the problem which inventors have had to solve.

A moderate escape of gas in front of the first position of the ball, is not found to be any material disadvantage. If, then, the barrel could have an opening, as in fig. 1, at *a*, where the cartridge could

Fig. 1.

be inserted, and then pushed backwards towards *b*, an escape of gas through the joints by which *a* might be subsequently closed would be comparatively immaterial; but this formation would be impracticable, because the explosion of each cartridge would drive the fouling more and more towards *b*, till ultimately the chamber between *b* and *a* would be unable to contain the cartridge. It is clear, therefore, that the charge must be inserted either at the barrel's head *b* (in fig. 2), or, if the

Fig. 2.

barrel be opened, in a space close to that head, as *c*. In either of these cases, the breech at *b* must be solidly closed to resist the explosion. A third case, as in the Snider, is where the cartridge is inserted, as at *c*, and then pushed forward to the position *d*,

the aperture *c* being closed by a solid breech-piece which completely fills that portion of the barrel, and forms, with the barrel's head, a massive foot to resist the backward pressure of the fired powder. But a perpendicular moving joint is found, in practice, to lead to a serious escape of gas: such a joint is shewn in fig. 3, and is naturally the most convenient in an arrangement like the Snider, where the breech-piece turns on a hinge.

Fig. 3.

In the Prussian needle-gun, the end of the barrel is the frustum of a cone, which fits into a corresponding cavity in the fore-end of the breech-piece *a*, as in fig. 4; this also is a serviceable form, precluding any deleterious escape, but only available when the breech-piece is pushed up from the rear.

Fig. 4.

In the Snider and several other breech-loading weapons, the cartridge is made itself to close hermetically the aperture between the barrel and the fore-end of the breech-piece. This is done by leaving a groove, as at *a* in fig. 5, round the hinder-end of the barrel: the

Fig. 5.

cartridge, *d*, has a portion of its case at the rear flattened out into a rim, which fits the groove *a*. This rim is seen on a Snider cartridge in fig. 6. The cartridge being enclosed in thick paper or metal,

Fig. 6.

or in thin paper outside brass foil, this material is expanded at the time of the explosion until it completely fills the open rim, and prevents any escape between the barrel and the breech-piece. In the Snider arm, the cartridge was enclosed in thin brass, with a brass disc at the foot, which seemed to expand better than any other material; and its blocking power is aided by the presence, in the foot of the cartridge, of a disc, *a*, of millboard; but in the latest cartridge an iron disc has been substituted for that of brass, on the ground of economy. On the whole, no arrangement has been found more efficacious than this for breech-stopping.

Having now shewn the principles of closing the breech, the mere needle-arrangement may be generalised in a few words, the remainder of the article being devoted to a more particular description of the two most prominent needle-guns—the Prussian Zündnadelgewehr and the British Snider. The needle is no more than a steel shaft—not necessarily pointed at the end, which can be drawn back and fastened in that position. It is, when released by pulling the trigger, impelled forward by a spiral spring or other appliance, and piercing the cartridge, it explodes a small cap of highly-sensitive detonating powder, placed either at the rear-end of the cartridge, as in the Snider, or in front of the powder, as in the Prussian cartridge.

The Prussian gun, which was first in the field,

consists, as regard its breech-apparatus and needle-lock, of three concentric hollow cylinders, with a solid cylindrical bolt inside the last (see figs. 7, 8, 9). The rear-end of the barrel is firmly screwed into the head of the chamber *a*, which is fixed to the stock of the piece, and is open at the rear-end. The upper half of the cylinder is cut away at the front-end for rather more than the length of the cartridge: this constitutes the opening in which the musketeer inserts the cartridge. From the rear of this opening to the back, a groove is cut, sufficiently wide to allow the square pillar of the breech-handle, *c*, to pass along it. In the middle of this groove is a right-angled shunt, offering a stop to the breech-handle when drawn backwards, unless it be likewise turned downwards, when it may be passed completely out at the rear-end. Next within the chamber is the breech-piece *d*, which, to admit the cartridge, is drawn back for a sufficient distance by the breech-handle along the groove. When the cartridge is deposited in the recess in the chamber, this breech-piece is closed against the heel of the barrel by moving up the handle to the front-end of the groove, and then turning it down to prevent it from being driven back on the explosion of the charge; representing, indeed, the resistance offered by the heel of an ordinary muzzle-loading barrel. Firmly screwed within the breech-piece, at a short distance from its front, is a solid block of metal *f*, on which impinges the first force of the explosion. Projecting from this block to the base of the cartridge, is a strong *tige*, or pillar, *g*, around which a space containing air is left. Through this pillar is the channel for the needle to work. Fitting within the rear-end of the breech-piece is a smaller cylinder *h*, constituting the lock of the gun. It slides within the breech-piece, and is retained from falling out backwards by the spring *i*, which catches in a notch at the end of *d*. Along the bottom of this cylinder is a groove to admit the passage of the trigger *k*; and at the back is a short upright handle, by means of which the weapon is cocked. Lastly, within the lock is a bolt *l*, pressed forward by a spiral spring, and having the needle, *m*, rigidly fastened to its front end. Having now described the several parts of the rifle, it is easy to follow it from the moment of a shot being fired until the next is ready for discharge. At the moment one shot has issued, the rifle will present the appearance in fig. 9, every part being as far forward as it can go. The soldier's first step is to press down the spring *i* with his finger, releasing the catch below it, and enabling him to draw back the lock to the next catch on the spring, into the position shewn in fig. 7. Having done so, he raises the breech-handle to the perpendicular, and passes it along the groove to open the breech. This done, he places the cartridge in the opening thus made in the chamber, and again moving up the breech-piece to close the breech, the *tige* in it pushes the cartridge forward into the barrel, and the rifle is at once at 'half-cock,' as in fig. 7; for in drawing back the lock, the front point of the spring *i* forced the bolt *l* (including the needle *m*) with it, and the projection, *n*, on it having passed over the head of the trigger *k*, is caught by the latter in a way which can only be released by the falling of the trigger. It will be observed that at half-cock the needle is ready to penetrate the cartridge, but that the spiral spring is loose and without power. To 'full-cock,' no more is necessary than to push *h* back to its original position. It cannot take the bolt, *l*, with it, as the trigger retains it to the rear. The position (fig. 8) is now obtained, in which the bolt, *l*, projects at the back, and the spiral spring is compressed into a state of passive strength.

BREECH-LOADING ARMS AND NEEDLE-GUNS.

All that is now needed to fire the gun is to press upon the trigger, until the point *o* bears, when the bolt *l*, being released by the depression of *k*, the

spiral spring asserts its power, and drives the needle into the heart of the cartridge, the parts all resuming the positions in fig. 9. At first sight, one can-

Fig. 7.—Prussian Needle-gun : Half-cock.

not help exclaiming: 'What a complicated apparatus with the four cylinders and the springs;' but, in reality, it is as simple as almost any other gun, for the whole mechanism of the Lock (q. v.) is dispensed with. If it be desired to take the needle-gun to pieces, press the trigger till the point, *p*, bears. If the breech-handle be then in the hinder part of its groove, the breech-piece with its contents will slip out of the chamber. Pressing down, next, the spring *i*, until the second catch is passed, there is nothing to retain the lock, *h*, in the breech-piece;

and the lock being free, the needle, with its attached bolt and spring, falls readily out of its fore-end. The gun is thus taken to pieces in a few seconds, and as many suffice to put it again in fighting order. The most delicate portions are the needle and the spiral spring; but in case of accident to these, there is a spare one in a small cavity opening by a spring in the butt-end of the stock. The worst feature about this celebrated gun is its weight, 12 lbs., or 33 per cent. heavier than the Enfield or Snider rifle.

Fig. 8.—Prussian Needle-gun : Full-cock.

The converted Enfield or 'Snider' rifle was selected in 1865—1866 by the British government from the specimens submitted at an open competition of inventors. It is an extremely simple weapon, and though by no means free from faults, has given very satisfactory results up to this time. The ordinary Enfield barrel is shortened by about three inches, and the heel of the remainder is screwed in to a strong ring, *a* (figs. 10, 11), with which is connected by a powerful hinge, *b*, the solid breech-piece, *c*, which, when shut, as in fig. 11, completely closes the breech. Through this passes the needle or bolt from *d* to *e*; the normal position of the

needle is maintained by a spiral spring within the nipple *f* (which screws into the upper side of *c*), and is such that the needle does not project at *e*, while it does project at *d*. At *g* in the breech is a small compressible knob, which fits into a niche in the breech-piece, and serves to keep it from shaking up by ordinary motion, but is too weak to oppose opening by the finger on the projection *h*. Given the breech open as in fig. 10, the cartridge is inserted and pushed forward into the barrel, where its metal rim fills the groove left around the barrel's heel. The breech-piece, *c*, is closed down, as in fig. 11, the hammer, *i*, drawn to full-cock, and the piece is ready

varies from 15a. to 20a.: already (October 1867) about a quarter of a million have been converted; and by the end of March 1868, it is intended that 350,000 shall be ready for use. The government factories can convert 1100 rifles daily.

At first, the firing of the Snider was inferior to the old Enfield; but, by alterations in the bullet, effected by Colonel Boxer, in the direction of decreasing the specific gravity at the apex by the insertion of a wooden plug (see fig. 6), this condition has been reversed, and the Snider now fires 30 per cent. better than the old Enfield. Of course, these changes add to the cost of the cartridge, which has, however, these great perfections—first, that it is absolutely impervious to wet; and second, that fire can scarcely be communicated to it otherwise than through the detonating cap. A single cartridge has been fired within a barrel of loose cartridges without exploding any of the others.

Adverting to fig. 6, which is as nearly as possible two-thirds the size of an actual Snider cartridge: the whole is enclosed in a roll of thin brass foil, outside which is a covering of oiled paper. Next the foot is the round of millboard *a*, encircling the percussion cap *b*, which communicates with the powder *c*. Between the powder and the ball is a layer of wool, *d*. The ball, *e*, has, as explained above, a peg of wood inserted at the apex, and a conical hollow is made at the base: into the wider part of this is dropped the wooden plug *f*, while on the circumference of the bullet, and outside this conical hole, are four small cannellures or cuts in the lead. When the powder explodes, the wooden plug is driven forwards to the head of the hollow, driving the base of the bullet outwards till the lead completely fills the grooves of the rifle—a process aided by the comparatively less resistance at the cannellures. These cannellures are also receptacles for a wax lubrication which prevents fouling, interposing always a film of wax between the bullet and the barrel. The charge and bullet are held together by the copper sheathing being pressed into the cannellures. Returning to the percussion-cap, we should find, if it were enlarged, an apparatus—as in fig. 12—where *a* is a thin plate of copper closing the mouth, *b* is a brass bead called the 'anvil,' and *c* is detonating powder of great sensitiveness. The needle pierces *a*, drives the anvil down upon the detonating powder, which explodes, and through the opening *d*, communicates with the powder in the cartridge. The weight of the bullet is 480 grains; of the powder, 70 grains: the cost being about £3 per thousand.

Fig. 12.
Snider Cap.

From this description, it is evident that the Snider cartridge is a complicated arrangement; but in the first place, it is not much more so than that of the Zündnadelgewehr, though vastly more efficient; and, in the second, it must be borne in mind that the separate operation of capping is dispensed with.

In comparing the Snider and the Prussian gun, the former has certainly the greater simplicity; while its smaller weight (9 lbs. 4 oz. to 12 lbs.) is an immeasurable advantage. Of the two, it is probably the less likely to get out of order, but would perhaps be the most difficult to restore if it did. There is this difference of a material character between the two weapons, that in the Prussian arm, the needle, by its own mechanism, fires the charge; while in the Snider, it is a mere medium for conveying the blow of the hammer.

It may be useful here to say a few words as to the course pursued by foreign governments in this

matter, which is held to be of sufficient importance to precipitate or delay political complications. Prussia adheres to its needle-gun. England converts on the Snider principle (with a bore of .577 inch), reserving the question of a smaller bore rifle for new supplies. Belgium and Turkey convert as Sniders; but the latter has adopted the 'Samson' rifle for new weapons. France does not convert, but selects the 'Chassepot' for new supplies, with a bore of only .433. Austria converts after Wanzl Portugal's and Italy's new rifles are to be Westley Richards'; Sweden's, Högstom's; Russia's, Laidley, while her present stock are converted on Terry's principle. The United States have chosen the Berdan and Spencer systems. Switzerland converts on the Amal-Milbank principle, and makes new arms on that of Winchester, an American.

The breech-loaders with and without the needle-arrangement are too numerous even for mention; one of the most remarkable is the Spencer Magazine Rifle, having, in a tube in the stock, a series of cartridges, which, by a simple action, pass into the barrel for discharge. As the gun can ordinarily be loaded at the breech without drawing on the magazine, it is doubtless that this reserve would be a powerful means of defence in a moment of danger, as in resisting cavalry; but among its drawbacks are weakening of the stock, serious increase of weight, and, worst of all, great complexity and delicacy—fatal objections in the rough usage of active service.

BRENNER PASS, a pass in the main chain of the Alps, on the road between Innsbruck (q. v.) on the north and Botzen (q. v.) on the south, connecting the south of Germany with Venice and the north-east of Italy. The B. P. is the lowest which crosses the main chain of the Alps, the summit being only 4775 feet above the level of the sea. Lofty mountains rise above it to the further height of more than 7500 feet, yet the scenery of the pass is less sublime and less interesting than that of any other of the great passes of the Alps. It is open at all seasons of the year. At the summit of the pass is the village of Brenner, a resting-place for travellers, with a pop. of about 400. The climate here is so severe that corn seldom ripens. Here the traveller finds in close contiguity the Eisach, a small stream, which, after growing to be a considerable river, joins the Adige, and the Sill, a tributary of the Inn; the one stream flowing to the Gulf of Venice, and the other into the Black Sea. On 18th August 1867, a railway through the B. P. was opened, and thus a complete line of railway communication is established between Germany and Italy; Botzen having already been connected by a railway through the valley of the Adige, with Verona, and so with the whole of Italy—Innsbruck being likewise connected with the railway system of Germany. This work was begun by the Austrian government when Venetia belonged to the Austrian Empire, and with the view not only of facilitating military operations, but of restoring the commercial prosperity of Venice, by making it the port of Southern Germany. The prosecution of the works, however, was not arrested by the great political changes which took place. A liberal commercial treaty, recently made between Austria and Italy, binds the two countries together in community of interests, restoring, in fact, the natural state of things with which political animosities had long interfered; and it has already begun to be apparent, from the activity with which the roads are being repaired on some of the Alpine passes, and particularly that of the Stelvio, that both Germans and Italians appreciate the importance of an intimate commercial intercourse. The distance from

Innsbruck to Botzen in a direct line is only 52 miles, but by the windings of the road or of the railway, it is much increased.

BREZOWA, a market-town of Hungary, in the county of Neutra, on a river of the same name, about 19 miles north-west of Leopoldstadt. It has a Roman Catholic church and a Protestant church, tanneries, and distilleries. Pop. 5516.

BRI'ERLY HILL, an ecclesiastical district of Staffordshire, England, two miles north-north-east from Stourbridge, on the Oxford, Worcester, and Wolverhampton Railway. It is a place of much activity, the district abounding in coal, iron, and fireclay; and there are here numerous collieries, large iron-works, glass-works, brick-works, and potteries. The manufacture of steam-boilers is extensively carried on. Pop. (1861) 10,755.

BRITANNIA METAL. The present composition of Britannia metal at Birmingham is usually 90 tin + 8 antimony + 2 copper, without any zinc or bismuth; although some manufacturers deviate a little from this formula, by adding one or both of the metals last named. The manufacture was begun at Sheffield by Hancock and Jessop, in 1770; it reached Birmingham towards the close of the century, and made gradual progress. At first, the articles were made by stamping with dies, and soldering up into form; this, being a slow operation, rendered the articles expensive. Afterwards, the curious process of *metal-spinning* was introduced; and this, with the subsidiary operation of swaging, rendered a great reduction in price possible. In the spinning process, a thin sheet or piece of Britannia metal is placed upon a wooden model shaped like the article to be made; the model is made to rotate in a lathe; and burnishers and other tools are employed to press the yielding metal into all the curvatures of the model. Ductility is an essential quality to the attainment of this end with the metal; how complete it is, may be seen in such articles as Britannia metal teapots and dish-covers, the principal forms of which are not given by hammering, stamping, or casting, but by spinning. Besides spinning and swaging, the processes include stamping, soldering, casting, and polishing. When electro-plating was introduced, an increased use of Britannia metal arose, as it forms a good ground or basis for the deposited silver. Britannia metal spoons and ladles, made by casting, stamping, and burnishing, have been nearly driven out of the market by German silver; but the former metal is more largely used than ever for hot-water jugs, soup tureens, gravy-dishes, vegetable and side dishes, dram bottles, drinking-cups, sandwich cases, wine-coolers, soap-boxes, liquor-frames, cruet, waiters, trays, &c.; and as a basis for electro-plate. Birmingham is the chief seat of the manufacture.

BRI'XHAM, a market-town and seaport of Devonshire, England, beautifully situated on the south side of Tor Bay, 5 miles south from Torquay, and 22 miles directly south from Exeter. The town occupies the sides of two hills, and is divided into two parts, called Upper and Lower B., the former consisting chiefly of a long straggling street. Some of the more recently erected parts of the town are well built, and contain good houses, but the older parts are mean. The prosperity of B. depends chiefly on its fisheries, it being the head-quarters of the great Devonshire fishery of Torbay, in which many vessels are employed, mostly trawlers, of which there are about 200. These are decked sloops of 40 to 50 tons burden, and generally managed by three men and a boy. Great quantities of fresh fish are sent to London, Bath, and Bristol. Considerable quantities of iron ore are raised in the neighbourhood and

shipped here. B. has also a number of vessels engaged in the coasting and foreign trade, the foreign trade being chiefly with the Mediterranean. The Admiralty have an establishment here for watering the navy. Near B. is a station of the South Devon branch of the Great Western Railway. It was at B. that the Prince of Orange, afterwards William III., landed, November 4, 1688. Pop. (1861) 4390.

BRO'MSGROVE, a market-town of Worcester-shire, England, near the small river Salwarp, 12 miles south-south-west from Birmingham. It is 1½ mile east from a station on the Birmingham and Bristol Railway. The Birmingham and Worcester Canal also passes near it. It is situated in a highly cultivated and richly wooded valley. The principal street is about a mile in length. There is a very flourishing grammar-school, founded by Edward VI. in 1553. The linen manufacture was formerly carried on at B.; button-making and nail-making are at present the principal branches of industry. B. returned two members to the House of Commons in the reign of Edward I., but was afterwards disfranchised on petition of the inhabitants themselves, because the trade of the town had declined. Pop. (1861) 5262.

BROOKS, CHARLES SHIRLEY, novelist and journalist, is the son of Mr William Brooks, an architect, and was born at Brill, in Oxfordshire, about the year 1820. B. was educated chiefly by the late Rev. T. J. Bennett, canon of St Paul's; and upon leaving school, was articled to an attorney. Upon serving out his time, he passed with distinction the examination in the Law Society's Hall. Literature, however, had more charms for him than the law, and he had not long been settled in London, before he tried the experiment of living by it as a profession. He wrote dramas—*Our New Governess, Honours and Tricks, The Creole, The Daughter of the Stars*; and he contributed at the same time to some of the leading periodicals and journals. An introduction to the editor of the *Morning Chronicle* procured him a steady engagement as writer of the Parliamentary Summary for that journal. He was also sent by the proprietors of the *Chronicle* on a mission into Russia, Syria, and Egypt, to report on the condition of labour and the poor in those countries; and the results of his observations appeared in a series of letters in that journal. B. has also been a contributor to *Punch* from the commencement of that periodical. The 'Essence of Parliament' in *Punch* is said to be regularly contributed by him. He has also written for it 'Miss Violet and her Offers,' 'The Naggletons,' &c. B. has also contributed political and other articles to the columns of the *Illustrated London News*. As a novelist, B. is a graceful and pleasing writer, and therefore deservedly popular. He is author of *Aspen Court, The Gordian Knot, and The Silver Cord*, the last mentioned having been originally published in *Once a Week*. B. is likewise author of *The Russians of the South*, which appeared in the Travellers' Library, vol. vi.; and he is now publishing in numbers a new novel, under the title of *Sooner or Later*.

BROOM-CORN, a grass cultivated in North America for the manufacture of brooms and whisks, which are made of the tops of the culms and the branches of the panicle. It is regarded as a mere variety of the same species (*Sorghum saccharatum*), of which the shaloo, or sugar-grass (see **SUGAR-CANE** and **DURRA**), is another variety. It has been much longer cultivated in North America, however, than the sugar-yielding variety. Its introduction is ascribed to Dr Franklin, who, seeing an imported

whisk in the possession of a lady of Philadelphia, found a single seed on it, and planted it. It is said to have been brought from the East Indies. It is now extensively cultivated in all parts of the United States, and especially by some branches of the religious society called Shakers. The manufacture of brooms is annually becoming of greater importance, much capital being invested in it. The crop of B. has a beautiful appearance when near maturity. It often attains a height of 12—15 feet. The stalks are long and hard, and mostly used for manure, although cattle will feed on them before they are touched by frost, and cattle are very fond of the leaves. The seed is used like Indian corn, for feeding poultry, and sometimes for feeding cattle and horses. The usual practice in harvesting B. is to bend the stalks 2½—3 feet from the ground, and leave them a few days to dry, then to cut them over 6—8 inches below the panicle, laying the tops in heaps, to be conveyed to the scraper, which is often wrought by horse-power, and which removes the seed from them. Improved machinery has recently begun to be employed in the manufacture of brooms and whisks from B., and they are therefore produced with much greater rapidity than before. It is supposed that, in 1860, about 10,000 acres of B. were cultivated in the state of New York, 9000 in Illinois, 6000 in Ohio, and about an equal amount in all the other states of the Union, or 30,000 acres in all; the value of the produce about 1,590,000 dollars. Great numbers of brooms and whisks of this material are exported to Britain.

BROWN, CHARLES FOSTER, an American humorist, better known as 'ARTEMUS WARD,' was born in Waterford, Maine, in 1836, and graduated from the free village school into a printing-office—the American boy's college. As a printer's boy, he worked in all the principal towns in New England, until settled at Boston, where he began to write comic stories and essays. A roving disposition carried him to the West, and he was engaged as local editor in Toledo, and later in Cleveland, Ohio, where his letters from 'Artemus Ward, showman,' a pretended exhibitor of wax figures and wild beasts, first attracted general attention. In 1860, he became a contributor to *Vanity Fair*, a New York comic weekly paper; and being invited to lecture, soon became very popular and attractive. As a lecturer, in 1863, he visited California, making the overland trip, visiting Salt Lake City, the Mormon capital, and drawing crowds in every town he visited. In 1864, he opened his illustrated lectures on California and Utah in New York with immense success; and in 1866, was induced to visit England, where he became a contributor to *Punch*, and gave his lecture on the Mormons in the metropolis, at the Egyptian Hall, Piccadilly. But while convulsing crowded audiences with laughter, he was wasting with pulmonary disease. Early in 1867, he went to Guernsey for a milder air, but with no benefit; and was about to embark for America, when he died at Southampton, March 6, 1867. He was tall, slender, with striking features, and a most amiable character, which attracted and attached to him many friends. By his will, after providing for his mother, leaving legacies to his friends, and his library to the best boy in the school of his native village, he left the bulk of his property in trust to Horace Greeley to provide an asylum for printers. His collected writings, which have had a wide circulation in America and England, are *Artemus Ward His Book*; *Artemus Ward among the Mormons*; *Artemus Ward among the Fenians*; and a posthumous collection and biography entitled *Artemus Ward in England*.

BRSHES'NY, an insignificant town of Poland.

in the government of Warsaw, 62 miles south-west of Warsaw, near the railway that connects Warsaw with Vienna and other places. Pop. 5375.

BRYOPHYLLUM (Gr. *bryon*, moss, and *phylon*, a leaf), a genus of plants of the natural order *Crassulaceae* (q. v.). *B. calycinum*, a succulent shrubby plant, a native of the Moluccas, with quinate or almost pinnate leaves, oblong deeply crenulated leaflets, and panicles of large pendulous greenish-yellow flowers, is not unfrequent in British hot-houses, being regarded as an object of interest, upon account of its producing buds on the edges of the leaves more frequently than almost any other plant. These buds are capable of forming independent plants. This curious mode of propagation is found also in the Bog Orchis (*Malaxis paludosa*), a plant of a very different natural order. See **BUD** and **LEAF**.

BRUISE, or **CONTUSION**, signifies an injury inflicted by a blow or sudden pressure, in which the skin is not wounded, and no bone is broken or dislocated. Both terms, and especially the latter, are employed in surgery to include all such injuries in their widest range, from a black eye to a thoroughly crushed mass of muscle. In the slighter forms of this injury, as in ordinary simple bruises, there is no tearing, but only a concussion of the textures, the utmost damage done being the rupture of a few small blood-vessels, which occasions the discoloration that is always observed in these cases. In more severe contusions, the subjacent structures—muscles, connective tissue, vessels, &c.—are more or less ruptured, and in extreme cases, are thoroughly crushed, and usually become gangrenous. The quantity of blood that is extravasated mainly depends upon the size and number of the ruptured blood-vessels, but partly also on the nature of the textures of the injured part. Thus, a lax tissue, as that of the eyelids, favours the escape of blood into the surrounding parts. Moreover, the constitution of the patient has some influence, and many persons, especially (according to Mr Paget, in his article on 'Contusions' in Holmes's *System of Surgery*, vol. i.) pallid, fatty, soft-skinned women, though suffering from no apparent disease, are subject to extravasations, and consequently to discolorations, very disproportionate to the injuries that cause them.

The most characteristic signs of a recent contusion are more or less Shock (q. v.), pain, swelling, and discoloration of the surface from effused blood (commonly known as *Echchymosis*, q. v.). There is nothing special in the character of the shock, but it is worthy of notice that it is most severely felt in injuries of special parts—as the testes, the breasts, and the larger joints, which are often followed by remarkable general depression, faintness, loss of muscular power, and nausea. The immediate pain following the blow is succeeded by a feeling of numbness, which, after a varying time, unless the part is killed, gives place to a heavy, aching pain. Although some depression may usually be observed immediately after the infliction of the blow, swelling of the parts rapidly follows, as may be well seen in the case of a child receiving a blow on the head, or of the wale that rises after the lash of a whip. In lax parts, such as the eyelids, the swelling is often considerable, and may remain for a week or more; but in other parts, it usually subsides in two or three days. The discoloration of the skin consequent on blows is of a more or less purple tint, varying from black to crimson or pink. 'Blackness,' says Mr Paget (*op. cit.*), 'usually indicating intense injury, is probably due to the extravasation of a large proportion of entire blood; crimson or pink tints, to the prevalence of a blood-stained fluid;

blue, to the degrees in which blackness is veiled by the cuticle and skin, as the colour of blood in veins is; and perhaps some of the shades of pink to the partial aëration of the blood by the penetration of air through the epidermis. After a variable time, proportionate to the severity of the injury, these colours fade out, passing most commonly through gradually lightening shades of brownish olive, green, and yellow.' The causes of these changes of colour are not clearly known; as, however, the changes are not observed in bruises of parts removed from air and light, they are probably due to oxidation and actinic agency. When a severe bruise tends to a natural cure, and there is no inflammation or sloughing, the effused blood is generally absorbed, the liquid portion rapidly disappearing, while the blood-cells are more slowly removed. In some cases, it is probable that the effused blood becomes organised into vascular connective tissue, which takes part in the repair of the injured tissue. We need not follow the course of a bruise in which active inflammation with suppuration ensues, or in which sloughing takes place, as these complications must be treated according to the ordinary rules for those affections. There are, however, one or two ill consequences following partial recovery, which require notice. Thus, in some organs, as the breast, abscess may ensue long after a blow; or a sensitive indurated lump may remain; or (more commonly) there may be long-continued pain, without change of texture; or, lastly, cancer may ensue. Blows on superficial bones, as those of the skull, are not unfrequently followed by very painful thickening of the periosteum; and a muscle violently struck may be paralysed, and rapidly waste away; and constitutional diseases, such as gout and rheumatism, are well known to localise themselves with special severity in parts that have once been seriously bruised.

With regard to treatment, simple and not very severe bruises require little treatment but the rest necessary for the avoidance of pain; but the removal of the swelling and discoloration may be hastened by the application of various local stimulants, which seem to act by accelerating the circulation through the bruised part, and promoting the absorption of the effused fluid. Friar's balsam, compound soap liniment, or poultices made with the roots of black bryony beaten to a pulp, are popular remedies of this class. Mr Paget regards the tincture of arnica as the best application. Where the skin is thick, it may be gently rubbed over the bruised part in an undiluted state; where the skin is thinner, it should be mixed with an equal bulk of water; or, which is probably better, it may be constantly applied as a lotion if diluted with five or six parts of water. Pugilists, who are probably better acquainted with ordinary bruises than any other class of men, are in the habit of removing the swelling of the eyelids that often naturally occurs during a prize-fight, to such an extent as to close the eyes, by at once puncturing the eyelids at several points with a lancet; and their favourite remedy for a black-eye or other bruise on the face is a fresh beef-steak applied locally, as a poultice. Bruises of a more severe nature, as when there is much breaking or crushing of the tissues, must, of course, at once be placed in the hands of a surgeon.—For further details on this subject, the reader is referred to Mr Paget's excellent article, from which we have freely quoted.

BUCCARI, or **BAKAR**, a free port of Austrian Croatia, on an inlet of the Gulf of Quarnero, 5 miles east-south-east from Finme. It is beautifully situated on the slope of a hill, and has a small but very good and safe harbour. The linen manufacture

is carried on here, and ship-building is actively prosecuted; but the inhabitants are principally sailors and fishermen. The tunny fishery is the chief fishery of this part of the Adriatic. The vine is extensively cultivated in the neighbourhood of B., and good wine is made. Pop. 5070.

BUCKLAND, **FRANCIS TREVELYAN**, a son of the Rev. Dr Buckland (q. v.), born at Christ Church College, Oxford, December 17, 1826. He was educated at Winchester School, and at Christ Church College, Oxford. He devoted himself to the study of medicine; and after being house-surgeon of St George's Hospital, London, was appointed assistant-surgeon to the 2d Life-guards in 1854. From this situation he retired in 1863. In 1866, he was appointed Inspector of Salmon Fisheries for England and Wales. From his boyhood, he manifested an enthusiastic delight in natural history, especially when it could be applied practically to the cultivation of useful quadrupeds, birds, or fish, in which study he was encouraged and guided by his father. He has contributed a vast number of brief papers on various branches of his favourite science to the *Times*, *Field*, *Queen*, *Land and Water*, &c. He is also the author of *Curiosities of Natural History* (Lond. 1857; second series, 1860; third series, 2 vols., 1866), and of a work on pisciculture, entitled *Fish-hatching* (Lond. 1863); and editor of a new edition of his father's *Bridgewater Treatise* (Routledge, 1858). He was first secretary to the Acclimatisation Society of Great Britain and Ireland. He is an acute observer, and his writings on subjects of natural history in great part exhibit the results of fresh and original observations, which his sprightly style exhibits in a most interesting manner. He has long taken a great interest in fish-culture, and has been actively concerned in the recent endeavours to promote it in England. He has, at his own cost, established under the Science and Art Department, South Kensington, a 'Museum of Economic Fish-culture,' illustrating the natural history of salmon and sea-fish by means of plaster-casts, which he makes with his own hands, and by preparations and dissections in spirits. He has also collected a series of oysters, illustrating their natural history and cultivation. He has received one silver and two bronze medals from the fish-culture exhibitions at Boulogne and Arcachon.

BU'ZACZ, a town of the Austrian Empire, in Galicia, 30 miles east-north-east of Stanislawow, on the Stripa, a considerable affluent of the Dniester. A treaty of peace between the Poles and the Turks was signed here in 1672. Pop. 8523.

BUDAON, **BUDAUN**, or **BUDAYOON**, a town of India, 140 miles north-west of Lucknow, giving its name to a British district of the Rohilkund division of the lieutenant-governorship of the North-west Provinces. It is situated in 28° 2' N. lat., and 79° 11' E. long. Its pop. was officially ascertained in 1848 to amount to 21,369. It was occupied by the mutineers and a body of liberated prisoners from Bareilly, June 1, 1857. The Europeans escaped by flight. It was captured by General Whitelock, April 19, 1858, and the rebels in this quarter were soon afterwards entirely subdued.—The district of Budaon contains an area of 2368 sq. m., and a pop. of 1,019,161, of which nearly six-sevenths are Hindus, and the remainder mostly Mussulmans. The district is a level, fertile tract on the Ganges and tributaries of it, of which the chief is the Ramgunga.

BUDHA'NUH, a town of India, in the British district of Mozuffurnggur, North-west Provinces, on the route from Kurnoul to Meerut, 43 miles south from Kurnoul. The surrounding country is

wooded and well cultivated, and the bazar of the town is well supplied. Pop. 6760.

BUFFO (Ital. from corrupt Latin *buffa*, a slap on the cheek, as practised by clowns and mountebanks in farces), an Italian theatrical term applied to an actor or operatic singer who takes the light or humorous part in an opera or play. A burlesque opera is called *opera buffa*, and a burlesque play, *commedia buffa*.

BUHREA'CH, a town of Oude, India, the principal place of a district of the same name. It is in N. lat. 27° 34', E. long. 81° 33'—65 miles north-east from Lucknow. It is an old town, of considerable size, situated in a pleasant wooded plain, on the left bank of the Sarju. The houses are mostly built of mud and covered with thatch; but the mausoleums, mosques, and residences of merchants are of brick and lime-mortar. North-east of the town is the tomb of Selar, a reputed Mussulman saint, to which there is a great concourse of pilgrims annually in the month of May.

BU'KKUR, a town of the Punjab, about three miles east from the Indus, on a water-course derived from the great river, and flowing parallel with it, 190 miles west of Lahore. It is situated in a fertile district, and carries on an active commerce. Pop. 5000.

BULLÆ are collections of serous fluids of considerable size, situated immediately beneath the cuticle, and rising from the true skin. They differ from vesicles only in size; and no very definite line can be drawn between a large vesicle and a small bulla. They usually vary in diameter from a quarter of an inch to two inches. They may be followed by crusts or by ulcerations. They constitute a special order of skin-diseases, which includes Pemphigus and Rupia (q. v.).

BULLAS, a town of Spain, in the province of Murcia, and 26 miles west-north-west of the town of Murcia. It is situated on a hill, 1840 feet above the sea. The streets are steep and unpaved. B. has manufactures of linen and hempen fabrics, earthenware, and brandy, and a considerable trade in manufactured goods and grain. Pop. 5145.

BULRAMPUR, a town of Oude, India, near the frontier of Nepaul, in N. lat. 27° 24', E. long. 82° 15', on the Raptée, in a plain, 90 miles north-east from Lucknow. It is a town of considerable size, but mostly of mud houses, covered with thatch. From B. there is a magnificent view of Dhawalagiri. The town is on one of the most frequented routes between Lucknow and Nepaul, so that during spring and summer it is much thronged by traders, exchanging the products of Hindustan and Tibet.

BU'LSAR, a seaport of India, in the British district of Surat, presidency of Bombay, on the estuary of a small river of the same name, which falls into the Gulf of Cambay. It is 44 miles south of Surat. It is a thriving place, with manufactures of gingham, and a considerable trade in grain, salt, and sugar. Pop. 7000, chiefly weavers and sailors, but partly also employed in agriculture.

BULUBGU'RH, or **BALLAMGARH**, a town of India, the principal place of a jaghire of the same name, called also Furreedabad. The town is situated on the route from Delhi to Muttra, 29 miles south of Delhi, in a pleasant well-cultivated country. The town is not large, and is very crowded, surrounded by a high brick wall, with mud bastions and a deep ditch. The jaghire has an area of 190 sq. m., and its pop. is supposed to be about 57,000. The British have never interfered with the civil or criminal affairs of the jaghire,

except when their interference was requested, during the minority of the present rajah; but the Rajah of B. derives his rights from the British government. The revenue of the state is estimated at 160,000 rupees. The rajah maintains a small force of 100 cavalry and 350 infantry.

BU'NDI, or **BOONDEE**, a town of India, in N. lat. 25° 26', E. long. 75° 43', 190 miles south-west from Agra, the capital of a small state of the same name. It is situated in a valley nearly surrounded by rocky hills. The palace of the rajah is on the slope of the hill above the town, and is of great magnificence and beauty, consisting of a number of parts built at different dates, but harmonising extremely well together. The town contains few notable edifices. It has two good bazars, but it is a place of little commerce. It is celebrated for its iron manufactures.—The raj or state of Bundi has an area of 2291 sq. miles. A range of mountains, running north-east and south-west, divides two nearly equal level tracts—that on the south-east extending to the river Chumbul, and that on the north-west to the base of the mountains towards Ajmere. The climate is said to be unhealthy. Although the rajah and dominant portion of the inhabitants are Rajpoots, the greater part of the population, particularly in the mountains, are Meenas, supposed to be an aboriginal race, who are indefatigable freebooters. The military force of the state, including the troops of the feudal chiefs and the police force, is 6170 men. The revenue is about £50,000.

BU'NGAY, a market-town of the county of Suffolk, England, 30 miles north-north-east from Ipswich. It occupies the sides and summit of a gently rising hill, on the right bank of the Waveney, and is a well-built town, with wide streets, the principal ones diverging from the market-place. The town grew around Bungay Castle, which is supposed to have been erected by the Bigods, Earls of Norfolk, and of the walls of which some ruins still remain. The ruins of a Benedictine nunnery are also to be seen in the town. The Church of the Holy Trinity is an edifice with a round tower, supposed to be of the time of Edward the Confessor. There are numerous places of worship, belonging to different denominations, and schools, charitable institutions, assembly-rooms, &c. What was formerly the theatre is now used as a corn-hall. B. carries on a considerable trade by the river Waveney in corn, malt, flour, coals, and lime. Pop. (1861) 3805.

BUNION is a term applied in Surgery to enlarged bursa, or synovial sacs, situated in the anterior part of the foot, and especially over the metatarsal joint of the first or the fifth toe (see Foot), and accompanied by more or less distortion of the joint. In the great majority of cases, bunions are directly produced by the pressure of badly-fitting boots; and if the boots are constructed of patent leather, or any material which stops the extruding action of the skin, this, too, may be regarded as an indirect cause of their formation. A bunion begins as a painful and tender spot over one of the metatarso-phalangeal joints; the part gradually enlarges, and there are indications of an effusion into a natural bursa or a newly-formed sac. The progress of the affection may stop here, the bursa remaining, and serving to protect the subjacent parts from pressure; but far more frequently it undergoes repeated attacks of inflammation, causing its enlargement; or becomes the seat of corns; or suppuration of the contents of the cyst ensues. The last accident may be followed either by obliteration of the cyst, and cure, or by a troublesome form of ulcer, especially in persons of languid circulation.

It is only in its early stage that there is any hope of removing the disease; subsequently, the treatment must be only palliative. The tender spot that precedes the enlargement should be covered by night with wet lint and oiled silk, while by day a boot or shoe exerting no pressure on the part should be worn. If the part is very tender, it may be covered during the day with soap-plaster spread on wash-leather. As soon as a cyst can be detected, the part should be occasionally treated with strong tincture of iodine, with the view of promoting absorption. The writer of the article on this subject in Holmes's *System of Surgery*, recommends an ointment of biniodide of mercury (ten grains to an ounce of lard) for the cure of bunions when uninfamed, and for such as have much fluid within them. It should not be applied so constantly as to blister the skin. When, from any cause, inflammation takes place in the sac, water-dressing, or a poultice, should be applied; and as soon as there are definite signs of suppuration, a free incision should be made, which at once relieves the pain, and is often followed by a complete cure.

The ulcers resulting from the bursting of a bunion are very difficult to heal, especially in old persons whose circulation is languid. Stimulating local applications, such as ointment of resin, should be applied, while opium and stimulants should be prescribed for internal use, together with nourishing diet. Such ulcers, under the best treatment, not very unfrequently form the starting-point for senile gangrene.

BUNZLAU, JUNG or NEUE (*New Bunzlau*), a town of Bohemia, on the left bank of the Iser, a tributary of the Elbe, 31 miles north-east from Prague. It is well built of stone, has several churches, a Jewish synagogue, barracks, a hospital, a Piarist gymnasium, &c. It has manufactures of cotton and woollen fabrics, soap, and leather. It is said to have been founded by King Boleslaf in 973, and the fort built by him still exists. Its Bohemian name is *Mlada Boleslav*. Pop. 7779.

BURASS, a town of India, in the British district of Paneput, North-west Provinces, on the route from Kurnal to Kithul, in N. lat. 29° 45', and E. long. 76° 49'. Pop. 30,056.

BURENDA or **BROANG PASS**, a pass across the most southern range of the Himalaya, in N. lat. 31° 23', E. long. 78° 12'. It is reached from India by travelling up the Pahur River nearly to its source. The highest part is 15,095 feet above the sea.

BURENG, a remarkable valley of Cashmere, in N. lat. 33° 20'—33° 30', E. long. 75° 10'—75° 28', and extending in a direction from south-east to north-west. Its upper extremity reaches nearly to the summit of the Snowy Panjal Mountain. The whole valley appears to be honeycombed by caves and subterraneous water-channels. The Bureng River, which flows through it, suddenly sinks through an opening in its rocky bed.

BURHAMPORE, a town of Bengal, India, in the British district of Moorshedabad, on the left bank of the river Bhagruttee, a great offset of the Ganges. It is rather more than four miles south from Moorshedabad, and the village of Gossunbazar lies between. The situation is low and moist, and was deemed very unhealthy for Europeans, cholera and other endemic diseases prevailing greatly; but sanitary measures recently adopted have been attended with very beneficial results, and as a military station, B. is said to be as healthy as any in Bengal. Many fine houses have been erected by Europeans, the place being the site of the civil establishment of the district, as well as of a military cantonment.

BURHAUNPUR, a large town of India, in the territory of Gwalior, or possessions of Scindia's family, on the right bank of the Tapti, in N. lat. 21° 18', E. long. 76° 20', 280 miles north-east from Bombay. The banks of the Tapti are here bold, rising 60 or 70 feet above the stream. The town is surrounded by a rampart of brickwork, and contains a palace built by Akbar. A few of the wealthier merchants have good houses, built of teak, and profusely decorated with carvings. The most wealthy and influential are the Boraha, a Mohammedan tribe, who inhabit a distinct ward, which they shut up at night, excluding all other persons. There are manufactures of muslins, flowered silks, and brocades, for which the place was formerly famous, so that, in the 17th c., they were exported in great quantities to Persia, Egypt, Russia, and Poland.

BURNS, REV. JABEZ, D.D., a Baptist minister, and one of the most prolific religious writers of the present day, was born at Oldham, near Manchester, in 1805, and was educated at Chester, and afterwards at Oldham Grammar-school. After helping his father as a medical practitioner, and acting as assistant in a drapery establishment, he joined the Methodist New Connection, and removed at the age of 21 to London. In 1828 and 1829, he published his first two works, *The Christian Sketch-book* and *The Spiritual Cabinet*, which gained him much popularity among the religious public. After having exercised the functions of the ministry at Perth, in Scotland, for a few years, he returned to London in 1835, to become minister of the General Baptist congregation assembling in New Church Street Chapel, Marylebone. Here his fame increased so much, that it was found necessary twice to enlarge his chapel during the first 25 years of his ministry, in order to afford room for the large numbers who flocked to hear him. He has been elected by the body to which he belongs to fill various posts of honour, and has lectured in all parts of the United Kingdom on Temperance, Peace, Abolition of Capital Punishment, &c. In 1839, Dr B. became editor of the *Temperance Journal*. About 1846, he received the degree of D.D. from the Wesleyan University of Middleton, Connecticut. Meantime his pen has not been idle, the number of his separate works being upwards of thirty, some of them consisting of a number of vols., and one of them, *Sketches and Skeletons of Sermons*, of 15 vols., having reached the 14th edition. The following are the names of a few: *Christian Exercises for every Lord's Day* (1858); *Christian Philosophy, or Materials for Thought* (1849); *Deathbed Triumphs of Eminent Christians*; *Light for the House of Mourning* (1850); *Pulpit Cyclopædia*, 4 vols. (1846—1860); *Marriage Gift-book and Bridal Token* (1862); &c., all of which are of high popularity among a large section of the English and American evangelical religious world.

BURNU'GGUR, a town of India, in Guzerat, the territory of the Guicowar, 52 miles north from Ahmedabad, in N. lat. 23° 48', E. long. 72° 38'. It is a place of considerable trade, which is mostly in the hands of wealthy Brahmans. Pop. 12,000.

BURTON, RICHARD FRANCIS, one of the most daring and successful of modern travellers, was born in 1821 in Norfolk. He is the son of Colonel J. N. Burton, and was educated in France and England. In 1842, he entered the Indian army, and served many years in Sindh. While in this employment, he exhibited a remarkable facility in acquiring the Eastern languages, and a still more remarkable dexterity in imitating the appearance and habits of the natives of India. In 1851, he published his first important work—*Sindh, and the Races that inhabit the Valley of the Indus*—full of graphic description,

and interesting to all readers. B. had acquired a very familiar acquaintance with Hindustani, Persian, and Moulteni. He had devoted special attention to Arabic, and had made such progress as to be able to speak it like a native. Possessed of these qualifications, he resolved to explore Arabia in the disguise of an Afghan pilgrim; and after a visit to England, he set out on his journey. Political commotions prevented him from traversing the whole country, as he intended; but his *Personal Narrative of a Pilgrimage to El Medinah and Meccah* (1855) records one of the most daring feats on record. A perpetual strain on the ingenuity was necessary to keep up his assumed character, most difficult in moments of fatigue, and in the midst of shrewd and observant fellow-travellers. The next journey undertaken by B. was into the country of the Somaalia, in Eastern Africa. It proved less successful than was anticipated. B.'s companion, Lieutenant Stroyan, was killed, and B. himself was wounded. He succeeded, however, in reaching Harar (q. v.), a most important town in Eastern Africa, not before visited by any European, and in penetrating a vast and populous region scarcely known to geographers. The journey led to a still more important series of expeditions—those to the country of the Upper Nile. Towards the end of 1856, B. set out in company with Lieutenant Speke, also of the Indian army, to ascertain the truth of the reports collected by the missionaries, that a vast sea existed in the heart of the continent. The journey is one of the most memorable of our time. It led to the discovery and exploration of the great lake of Tanganyika, and the opening up of the eastern part of the continent. B. was rewarded with the medal of the Geographical Society. His health had been affected by his African journeys, and he sought to recover it by a journey in North America, from which he brought the first reliable account of the Mormons. In 1861, B. was appointed consul at Fernando Po, on the west coast of Africa, and while holding this appointment, he visited the Cameroons Mountains, and went on a mission to the king of Dahomey, the incidents of both journeys being recorded in two of his most interesting works. B. has since become consul at Santos, in Brazil. He was entertained at dinner, before his departure, by the members of the Anthropological Society, and in a speech by Lord Stanley, who presided, will be found an interesting account of his career.—See *Report of Farewell Dinner to Captain Burton*, reprinted from the *Anthropological Review* (1865).

The following is a list of the principal works of Captain B. not mentioned above: *Sindh, or the Unhappy Valley* (1851); *Goa and the Bue Mountains, or Six Months of Sick-leave* (1851); *Falconry in the Valley of the Indus* (1852); *First Footsteps in East Africa, or an Exploration of Harar* (1856); *The Lake Regions of Central Africa, or a Picture of Exploration* (1860); *The City of the Saints, and Across the Rocky Mountains to California* (1861); *Abeokuta, or the Cameroons Mountains* (1863); *The Nile Basin—Part I.*, shewing Tanganyika to be Ptolemy's Western Lake Reservoir, &c.; and Part II., Captain Speke's discovery of the source of the Nile, a Review by J. McQueen (1864); *A Mission to Gelele, King of Dahome, with Notices of the so-called Amazons*, &c. (1864).

BUSSAHIR, a hill-state of Northern India, on the border of Chinese Tartary, in N. lat. 30° 56'—32° 8', and E. long. 77° 34'—78° 52'. It is one of the most elevated and mountainous countries in the world, the lowest part being more than 3000 feet above the sea, and much of it from 7000 to 12,000 feet. The Sutlej flows through the country from east to west. The district on the north of

the Sutlej is called Kunawur, that on the south is B. Proper. The climate in the lower parts on the southern frontier is almost tropical, and there are many genial and fertile districts of mild temperate climate; other districts are near, and within the limits of perpetual snow. The vine succeeds admirably in many places, and it is supposed that some parts of this state are extremely suitable for the culture of tea, which, indeed, is cultivated to some extent. Very rich deposits of copper ore have been discovered in Kunawur, and copper-mining is prosecuted near the south-west frontier. The inhabitants are little advanced in civilisation; many of those in the more northern parts have strongly marked Mongolian features. Polyandry prevails among them, and the females left unmarried take refuge in Lamaic convents. The rajah and upper classes in the southern parts are Rajpoots, and the people generally are of Hindu race. Their observance of Hinduism, however, is very partial; they eat readily any kind of flesh, except that of the ox. The Rajah of B. holds his dignity by a grant from the East India Company, made on the expulsion of the Ghoorkas in 1815. The tribute paid is £1500. The pop. is estimated at 150,000.

BUSTO-ARSIIZIO, a town of Northern Italy, in the province of Milan, and 20 miles north-west from Milan. It stands in a fertile plain, which produces much wine. In one of the churches are numerous statues and fine paintings, by Daniel Crespi, a native of the town. Remains of ancient buildings shew that B. was in ancient times a place of considerable importance. It is a place of active trade, and has a cotton-thread factory. Pop. (1861) 9978.

BUTERA, a town of Sicily, in the province of Caltanissetta, and 8 miles north-north-west from Terranova. It stands on a height on the left bank of the Manfria. Ruins of great antiquity exist in the neighbourhood, but the ancient name is unknown. In 853, B. was besieged for five months by the Saracens, who raised the siege on the surrender of 6000 people as slaves. B. was almost the last town in Sicily taken by the Normans, having held out against Count Roger till 1089. The present castle is of Norman erection, and contains a number of medieval antiquities. Pop. 4527.

BUTLER, BENJAMIN FRANKLIN, general of Volunteers, U. S. army, was born at Deerfield, New Hampshire, November 5, 1818. He graduated at Waterville College, Maine, in 1838, studied law at Lowell, Massachusetts, where he was admitted to the bar in 1841, and became distinguished as a criminal lawyer and democratic politician. He was a member of the state legislature in 1853, of the state senate in 1859—1860, and a delegate to the Democratic National Conventions at Charleston and Baltimore in 1860, where he supported the nomination of Jefferson Davis and John C. Breckenridge, and was nominated as the Democratic candidate for governor of Massachusetts. B. had risen to the rank of brigadier-general of militia; and at the outbreak of the War of Secession, April 17, 1861, he marched with the 8th Massachusetts Brigade, and after a check at Great Bethel, was appointed to the command of Baltimore, and subsequently of Eastern Virginia, with his head-quarters at Fortress Monroe. In February 1862, he commanded the military forces sent from Boston to Ship Island, near the mouth of the Mississippi; and after New Orleans had surrendered to the naval forces under Commander Farragut, he held military possession of the city, and by his severity, and especially by an, at least apparently, atrocious order respecting the treatment of women, brought upon himself the intense detestation of the Southern people, and a very general

feeling of reprobation. Relieved of his command, he returned to Fortress Monroe, acted under General Grant in his operations against Petersburg and Richmond, and, June 13, 1865, by his refusal to co-operate with the naval forces, caused the failure of the first attempt to take Fort Fisher, the chief

defence of Wilmington. Returning to Massachusetts at the end of the war, he took an active part in politics as an extreme Radical, advocated the impeachment of President Johnson; and in 1866, was elected member of the House of Representatives of the U. S. Congress.

C

CABEZA DEL BUEY, a small town of Spain, in the province of Badajoz, 86 miles east-south-east of the town of Badajoz, on the north slope of the Sierra el Pedrose. The town is tolerably well built, and has a number of churches and other public buildings. Pop. 5395, engaged chiefly in the manufacture of woollen and linen cloths.

CADAMBA, or **KUDUMBA**, the wood of several species of *Nauclea*, a genus of trees of the natural order *Cinchonaceae*, natives of the East Indies, having flowers with a funnel-shaped corolla. *N. cadamba* is a noble tree, with orange-coloured fragrant flowers, collected in heads about the size of a small apple. The leaves are from six to ten inches long. The wood is yellow, soft, and fine-grained. The tree is highly prized for the shade which it affords; the wood is used for various purposes. *N. cordifolia* is a large tree, plentiful in mountainous districts of Hindustan; the wood yellow, close-grained, and used for flooring-planks, packing-boxes, and many other purposes, as is also that of *N. parviflora*. All kinds of *C.* wood are, however, liable to be injured by moisture, and can only be used where they are to be kept dry.

CAHETÉ, or **CAETE**, a small town of Brazil, in the province of Minas Geraes, about 250 miles north of Rio de Janeiro. The town is tolerably built, has some churches, a hospital, primary school, electoral college. Agriculture and mining are carried on. Pop. about 6000.

CAIVANO, a town of Southern Italy, in the province of Naples, and 8 miles north of the city of that name. It was a place of considerable strength in the middle ages, and still retains many remains of its walls and towers, though they have suffered severely in the various revolutions of Naples. Pop. 9441.

CALABAR BEAN, a very remarkable medicinal agent, which has just been introduced into the new edition of the British Pharmacopoeia (1867). It is the seed of *Physostigma venenosum*, a twining, half-shrubby plant, a native of Western Africa, of the natural order *Leguminosae*, sub-order *Papilionaceae*, nearly allied to the kidney bean, but of a genus distinguished by the hood-shaped stigma, and the deeply-furrowed hilum of the seed. The following are the leading characters of the bean itself: 'About the size of a very large horse-bean, with a very firm, hard, brittle, shining integument, of a brownish-red, pale chocolate, or ash-gray colour. Irregularly kidney-shaped, with two flat sides, and a furrow running longitudinally along its convex margin, ending in an aperture near one end of the seed. Within the shell is a kernel, consisting of two cotyledons, weighing on an average

about 46 grains, hard, white, and pulverisable, of a taste like that of the ordinary edible leguminous seeds, without bitterness, acrimony, or aromatic flavour. It yields its virtues to alcohol, and imperfectly to water.' It is used in the form of an emulsion by the natives of Africa, as an ordeal when persons are suspected of witchcraft. About twelve years ago, Dr Christison very nearly fell a victim to his zeal for science in experimenting on some specimens of this bean which had been sent to Edinburgh by some African missionaries. In 20 minutes after taking 12 grains of the powdered seed, he was seized with giddiness and a general feeling of torpor; on which he took an emetic, and thus emptied his stomach. The giddiness, weakness, and faintness, however, increased to such a degree, that the physicians who were called in found him prostrate and pale, with the heart and pulse very feeble and irregular, and the faintness so great as to threaten immediate death, the mental faculties remaining perfectly clear. He complained of no pains or uneasy feelings, nor did the faintness of the heart's action give him any discomfort. Under the use of stimulants, warmth, pulsation, and the power of moving gradually returned, and the next day he was quite well. In 1854, 50 children were poisoned by eating these beans, which were swept out of a ship at Liverpool. A boy aged six years, who ate six beans, died very rapidly. The chief symptoms in these cases were griping, vomiting, and contracted pupils; the face was pale, the eyes bright and protruding, and in trying to walk, the children staggered as if they were drunk. According to Dr Harley, this agent destroys life by paralyzing the respiratory muscles, and although it weakens the heart's action, is rather a respiratory than a cardiac poison. Dr Fraser, in a paper which he lately communicated to the Royal Society of Edinburgh, on the subject of this poison, maintains that, in mammals, death is generally produced by a combination of syncope (faintness) with asphyxia (suffocation); the symptoms of the one or the other depending on the dose, which, when large, at once destroys the heart's action. It has been tried medicinally in small doses (one to four grains of the powder, or $\frac{1}{4}$ th to $\frac{1}{8}$ th of a grain of the extract) in chorea, tetanus, and other diseases of the nervous system; but its value as an internal medicine can hardly be said to be as yet established. Its principal use at present is to produce contraction of the pupils. This can be done by introducing into the eye either a minute quantity of the extract, or of paper, or gelatine rolled in a sheet, saturated with the extract, and divided into small squares, one of which is sufficient to produce the desired effect, which commences in about 10 minutes, and lasts for about 20 hours. It is regarded as a very valuable addition to our ophthalmic remedies.

CALASCIBETTA, or **CALATAS-CIBETTA** (Saracenic = Castle of Xibeth, or Scibet), a town of Sicily, near its centre, 54 miles south-east of Palermo, in the province of Caltanissetta. The town is mean and dismal looking, and is built on a steep and isolated height, the summit of which is 2570 feet above the sea, and commands a magnificent view. It was founded in 1080. The only object worthy of notice is the tower of the principal church, which is of early architecture. Pop. 5255.

CALLIA, a genus of plants of the natural order *Araceae*, or, according to some botanists, of the

Calla palustris.

natural order *Orontiaceae*, which is distinguished from *Araceae* only by having hermaphrodite flowers. The genus *Calla* is characterised by a flat spathe

(q. v.), within which is a cylindrical spadix (see *SPATHE*) covered with naked flowers, appearing as a mere mixture of stamens and pistils, and a one-celled ovary with 6—8 erect ovules. The known species are few, and natives of very different climates. *C. palustris* is found in swamps in Europe, Siberia, and North America, but not in Britain. It has a creeping root-stock, and heart-shaped, stalked leaves, the midrib of which is prolonged beyond the blade into a point; the spathe is white, and the spadix yellow. The root-stock is extremely acrid and caustic; but being deprived of its acidity by grinding, boiling, and macerating, is made by the Laplanders into a kind of bread called *Misebroed*, which they hold in high estimation.—The well-known and beautiful *Richardia Ethiopica* was formerly included in this genus, and is often still called *Calla*.

CALLERNISH, a district on the west coast of the island of Lewis, about 16 miles from Stornoway, remarkable for its circles of Standing Stones (q. v.). There are four circles, at no great distance from one another, but without any visible relation. The principal one, of which the figure gives a bird's-eye view, is of a more than usually elaborate design. 'A double line of upright stones run parallel to each other in a northerly direction, while a single line of similar stones is projected from the south, east, and west points, thus giving a cruciform figure to the structure. A stone of larger dimensions than any of the others occupies the centre of the circle, and completes the whole. . . . That the position was chosen and laid down from astronomical observation, can easily be demonstrated by visiting the spot on a clear night, when it will be found that by bringing the upper part of the single line of stones extending to the south to bear upon the top of the large stone in the centre of the circle, the apex of that stone coincides exactly with the pole-star. . . . The stones themselves are not

Callernish Circle.

columnar, or shaped into any form; they are simply broad, flat blocks of gneiss—the all-prevailing rock from the Butt of the Lewis to Barra Head. The following are their dimensions: diameter of circle, about 40 feet; length of west line, 43 feet; length of east line, 38 feet; length of south line, 69 feet; length of avenue, 270 feet; breadth of avenue, 27 feet; average height of stones, 6 to 8 feet; height of centre stone, 12 feet. There are 13 stones in the circle including the centre one, 19 in the avenue, 5 in each of the east and west, and 6 in the south arm. The measurements of height are taken from the present level; but it must be borne in mind that there is a bed of peat-moss, 4 or 5 feet thick, through which the stones rise from the clay beneath; this gives a height of 16 to 17 feet to the centre stone, and from 10 to 13 feet to the

others, exclusive of the foundation.'—*Notice of the Stone Circle at Callernish*, communicated to the Society of Antiquaries of Scotland, by Mr Henry Callender, March 1857.

CALTABELLOTA (a Saracenic name = 'the Castle of the Cork-trees'), a town of Sicily, Girgenti, 7 miles north-east of Sciacca, most picturesquely situated around an ancient castle, which crowns a steep rock overhanging a stream (anc. *Crissius*), of the same name as the town. Of its churches the *Chiesa Matrice* is a beautiful relic of the middle ages, resembling a mosque, with a single row of columns down the middle. C. was captured by the Saracens in 840 A.D. Pop. 5572.

CALTAVUTURO, a town of Sicily, province of Palermo, and 37 miles south-east of the city of that

name, on a small river, the Granda. The town is of Saracenic origin. Jasper is found in the neighbourhood. Pop. 5119.

CALW, an important manufacturing town in Württemberg, and capital of a bailiwick of the same name, in the Circle of the Black Forest, lies in the valley of the Nagold, on both sides of the stream, over which are two stone bridges. Cotton and woollen spinning, dyeing turkey-red, manufacturing woollen and cotton fabrics, making leather, stout shoes, cigars, &c., are the principal industries. Though the streets in the old town are irregularly built, there are many large and beautiful houses. Pop. (1864) 4397, nearly all Protestants.

CAMDEN, a city of New Jersey, U. S., on the left bank of the Delaware River, opposite Philadelphia, with which it is connected by 4 steam-ferries. It is the terminus of the New Jersey Central and Cape Island and Atlantic City Railways. It has a court-house, 2 banks, 2 railway depôts, 15 churches, ship-yards, iron-works, foundries, manufactories of machinery, &c. Pop. (1865) 18,000.

CAMO'RRA, the name of a secret society, existing throughout all parts of the former kingdom of Naples, the members of which are called *Camorristi*, and have exercised lawless force to a great extent over the humbler classes of society. Under the Bourbons, they openly presented themselves at markets, hackney-coach stations, public spectacles, and all occasions of popular amusement; assumed the right of deciding disputes; extorted a portion of whatever money passed from hand to hand for purchases, rents, wages, and the like, or in games; undertook also the transport of smuggled goods, and contracted for the commission of serious crimes. Their readiness for violence and murder, and their close association among themselves, made them so much dreaded, that even *Camorristi* who had been thrown into prison, succeeded in exacting money from their fellow-prisoners, and from the jailer himself. The society has a central rendezvous in every large provincial town, and twelve such in the city of Naples. Those who belong to each of these sections of the society are under the absolute government of a chief elected by themselves, with whom is associated a treasurer. The latter has the charge of the common fund into which all the *Camorristi* of that section pay their whole gains, for equal distribution among all their associates. Candidates for membership must shew that they have neither been guilty of espionage nor theft; also that neither their wives nor their sisters are prostitutes; and must swear upon an iron crucifix a fearful oath of fidelity and secrecy. The candidate remains for a year, with the designation of *Piccioletto d'onore*, as a pupil under an old *Camorrista*; and having completed this probation, and given proof of his courage and obedience in circumstances involving danger of life, he is advanced to the rank of a *Piccioletto di sparro*. Finally, after a longer period, and when he has given proof of his fitness on a number of occasions, he is admitted to full membership of the society as a *Camorrista*. Each *Camorrista* carries about with him two knives of peculiar form, by which the members of the society recognise each other. They are held under the strictest discipline. Disobedience is punished by flogging, suspension from employment, or expulsion; treachery, even on the part of a member who has been expelled, is punished with death. If two *Camorristi* quarrel, their chief decides the question between them; but in difficult cases, a duel with daggers is the mode of decision. Under King Ferdinand II. the *Camorra* was tolerated for political reasons. The government of Francis II. endeavoured to put down the society, and the police

received instructions to seize and transport all known members of it. Those who remained entered into alliance with the Garibaldi committee, and rendered essential service in the expulsion of the Bourbons. An attempt was now made to employ them in the police service, but completely failed. The *Camorra* having fallen out with the new government, the members of the society now chiefly live by robbery in South Italy.—See Monnier, *La Camorra, Notizie Storiche* (Flor. 1863).

CAMPANHA, a town of Brazil, about 150 miles north-west of Rio de Janeiro, surrounded by bare hills, much cut up by gold mines. The houses are built chiefly of earth, and surrounded by gardens. C. has several churches, a Latin school, an hospital, theatre, &c. Pop. 6000.

CAMPINAS, or SAN CARLOS, a town of Brazil, in the province, and 70 miles north of the city, of Sao Paulo, is situated in a fertile and picturesque district, on a small river, the Piraticaba, a feeder of the Parana. There are large coffee and sugar plantations in the surrounding district, and large quantities of sugar are exported. Many of the houses are built of mud or clay, and the immense church, whose walls are five feet thick, is composed of beaten earth. Pop. 6000.

CANADA has recently acquired a more enlarged signification. An act of the imperial parliament (called shortly the *British North America Act*) was passed 29th March 1867, and came into force 1st June of the same year, uniting federally the former separate provinces of Canada, Nova Scotia, and New Brunswick into one *Dominion*, under the name of *Canada*. The upper and lower divisions of the former Canada (q. v.), which had been politically united since 1840, are again dissociated, so that the federation consists of four members or provinces, as under:

| | English Square Miles. | Estimated Pop. (1867). |
|--|-----------------------|------------------------|
| Quebec (formerly <i>Lower Canada</i> , or <i>Canada East</i>), | 210,090 | } 3,800,000 |
| Ontario (formerly <i>Upper Canada</i> , or <i>Canada West</i>), | 121,260 | |
| New Brunswick, | 27,105 | |
| Nova Scotia, | 18,860 | |
| Total, | 377,045 | |

The constitution of the Dominion is after the model of the mother-country. The parliament consists of the Queen, an Upper House styled the Senate, and a House of Commons. The Queen is represented by a Governor-general (with a salary of £10,000), who exercises his authority with the aid and advice of a council, styled the Queen's Privy Council for Canada, chosen from time to time by the governor. The Senate consists of not more than 72 members, 24 for each of the provinces of Ontario and Quebec, and 12 each for the maritime provinces. The senators are chosen by the governor-general, and hold the appointment for life. Among other qualifications, a senator must have real property to the value of 4000 dollars, and must be resident in the province for which he is appointed. The Speaker of the Senate is nominated by the governor-general. The House of Commons consists (for the present) of 181 members—82 for Ontario, 65 for Quebec, 19 for Nova Scotia, and 15 for New Brunswick. The duration of a House of Commons is five years. Until the parliament of Canada otherwise provides, the franchise and other regulations are to be the same as those hitherto in force in returning members to the House of Assembly in the several provinces. The House of Commons elects its own Speaker. Any bill passed by the houses of parliament, even though assented to by the governor-general in the Queen's name, may

afterwards be disallowed by the Queen in Council. Each province has an executive and legislature of its own, presided over by a lieutenant-governor, and constituted in the meantime pretty much as before the union. The lieutenant-governors are appointed by the governor-general. The provincial parliaments may, under the provisions of the act, amend from time to time their own constitutions.

In the distribution of legislative power between the general and the provincial parliaments, certain classes of subjects of a local nature are assigned exclusively to the legislatures of the provinces, while subjects of more general concern are assumed by the parliament of Canada. Among the subjects enumerated in the act as coming under the latter description are: the public debt and property; taxation (for federal purposes), postal service, military and naval defence, the salaries of the civil officers of the general government; the census; navigation; money, weights, and measures; copyrights; marriage and divorce; criminal law. The provincial legislatures, again, have the power of taxing themselves for provincial purposes, and of borrowing money on the sole credit of the province; of regulating and paying provincial officers; of establishing asylums, &c. Education is also left to the provincial legislatures, with certain provisions against encroachment on the rights of religious minorities.

The debts of the several provinces, at the union, are assumed (with certain limitations) by the federal government; and, on the other hand, certain duties and revenues, and certain public works and properties belonging to the several provinces before the union, are taken possession of, to form a consolidated revenue fund for defraying the interest of these debts, and for the other expenditure of the federal government.

Provision is made for the introduction of uniformity of laws, which, however, must be with consent of the legislatures of the several provinces.

The union of the various British American provinces had been long and eagerly discussed, public opinion in Canada being generally in its favour, but in the other provinces, strongly opposed to it, from the natural apprehension, that the immense preponderance of C. in population, wealth, and general importance would utterly swamp the others. However, after much and careful consideration, the great advantages which it was shewn the scheme would confer, overcome the provincial jealousies, and the pro-federalists in Nova Scotia and New Brunswick came to preponderate. Newfoundland and Prince Edward Island have hitherto withstood all attempts to bring them into the confederation, but the state of feeling on the subject has changed much of late in both of these colonies, and ere long they will in all probability apply for admission, for which the act provides. In British Columbia, and in the Red River Settlement, there is a unanimous feeling in favour of annexation; and should those settlements, as well as the Hudson's Bay and North-west territories, be included in the confederation, its extent would amount to 3,369,300 English sq. m., and surpass that of the United States.

In 1865, the mercantile marine of the provinces constituting the new Dominion comprised 6575 vessels, of an aggregate tonnage of 943,533 tons, and ranks in importance next after those of the United Kingdom, the United States, and France. The imports in 1866 amounted to \$75,270,566, and the exports to \$71,951,699; the revenue for 1865 was \$13,023,169, and the expenditure \$14,173,071; and the total debt of the confederation is \$77,500,000.

CANANDAIGUA, a beautiful village in New

York, U.S., at the northern extremity of the lake of the same name, on the Rochester and Syracuse Railway, 220 miles west by north of Albany. Its broad shaded streets of villas and gardens are surrounded by fine scenery. It contains the county buildings, 7 churches, 3 banks, 2 newspapers. Pop. about 5000.

CANCRUM O'RIS, known also as *Noma*, *Water-cancer*, and *Water-canker*, is a peculiar form of mortification, arising apparently from defective nutrition. The disease seldom occurs except between the second and eleventh years, and is usually preceded by measles, remittent or intermittent fever, or some other serious disease. The following is the ordinary train of symptoms: more or less general disturbance of the system, accompanied by loss of appetite, followed by swelling of the salivary glands, and a profuse flow of saliva, which escapes from the mouth involuntarily during sleep; ulceration of the gums, which swell and become livid; looseness of the teeth; and the appearance of ash-coloured spots on the gums and adjacent mucous membrane, which turn into dark-coloured sloughy sores. These sores spread rapidly by a gangrenous process, expose the bone, and finally make a large aperture in the cheek. In some cases, the entire cheek has been destroyed in a very few days. Fortunately, this terrible disease is more rare in this country than in some parts of the continent, and most of the cases recorded are described by foreign writers. Van Swieten describes a case in which he saw the first set of teeth fall out, the second set destroyed, the lower jaw exfoliated, and the lips, cheeks, tongue, and chin eaten away before the child died. The obvious indications of treatment are to remove the patient to pure air, to administer tonics, nourishing food, and (in moderation) stimulants; to touch the diseased parts with nitrate of silver, or glyceride of carbolic acid, and to wash out the mouth frequently with a weak solution of Condy's fluid.

CANDE'LA, a town of Southern Italy, province of Foggia, 22 miles south of the town of Foggia. Pop. 6057. It is pleasantly situated on the summit of an eminence. The surrounding district is very fertile.

CANDLE-FISH, or EULACHON (*Thaleichthys Pacificus*), a remarkable fish of the family *Salmonidae*, nearly allied to the Capelin (q.v.), and, like it, strictly a sea-fish, approaching the coasts to spawn, but not entering rivers. The C. inhabits the Pacific Ocean, near the western shores of America, from Vancouver's Island northwards. It is not larger than a smelt, has a somewhat pointed and conical head, a large mouth, teeth on the pharyngeals, and the tongue rough, but the lower jaw, palatines, and vomer destitute of teeth. The colour is greenish olive on the back, passing into silvery white on the sides and belly, sparsely spotted with dirty yellow. It is probably the fattest or most oleaginous of all fishes, or indeed of animals, and is used by the Indians not only as an article of food, but for making oil. To broil or fry it, is nearly impossible, because it almost completely melts into oil. Indeed, the Indians often use it, in a dried state, as a lamp for lighting their lodges, merely drawing through it a piece of rush-pith, or a strip from the inner bark of the 'Cypress Tree' of these regions, *Thuja gigantea*—a species of *Arbor Vitæ*—as a wick, a long needle of hardwood being used for this purpose; and the fish being then lighted at one end, burns steadily until it is all consumed. In order to use the dried fish for food, the Indians often melt it into oil, by the application of heat, and drink the oil. It is also eaten uncooked. Drying is accomplished without

any gutting or cleaning, the fish being fastened on skewers passed through the eyes, and hung in the thick smoke at the top of sheds in which wood-fires are kept burning. They soon acquire a flavour of wood-smoke, and the smoking helps to preserve them. They are then stowed away in large frails, made from cedar-bark or rushes, in order to be used for food in winter. Immense shoals of *C.* approach the shores in summer, and are caught in moonlight nights, when they come to sport at the surface of the water, which may often be seen glittering with their multitudes. The Indians paddle their canoes noiselessly amongst them, and catch them by means of a monster comb or rake—a piece of pine-wood from six to eight feet long, made round for about two feet of its length at the place of the hand-gripe, the rest flat, thick at the back, but having a sharp edge in front, where the teeth are driven into it about four inches long, and an inch apart. These teeth are usually made of bone, but the Indian fishers have learned to prefer sharp iron nails when they can get them. One Indian, sitting in the stern, paddles the canoe; another, standing with his face to the bow, holds the rake firmly in both hands, the teeth pointing sternwards, sweeps it with all its force through the glittering mass, and brings it to the surface teeth upwards, usually with a fish, and sometimes with three or four, impaled on each tooth. This process is carried on with wonderful rapidity. When a sufficient quantity of *C.* has been dried for winter, the rakes that are caught are made into oil, being, for this purpose, piled in heaps until partially decomposed, and then placed in large square pine-tree boxes; a layer about three deep in the bottom of each box, covered with cold water, and a layer of hot stones put in, then a layer of small pieces of wood, another layer of fish, stones, and so on. The oil is skimmed from the surface of the water in the boxes. A vast quantity of oil is thus obtained. The *C.* is an excellent article of winter-food in a climate of which the winter is severe; and notwithstanding its excessive fatness, is of agreeable flavour. It has not yet become an article of economical value to the civilised inhabitants of North-western America, but seems very likely to do so, and to acquire a very considerable commercial importance.

CAPRERA, or CABRERA, one of a group of small islands called the Buccinari Islands, in the Strait of Bonifacio, to the east of the north point of Sardinia (q. v.). They belong to the Italian province of Cassari. *C.* is separated from the coast of Sardinia by a strait of little more than a mile in breadth, and by a similar narrow strait from the island of Maddalena, which lies to the west. Its greatest length, from north to south, is about six miles, and its breadth is from two to three miles. Like Maddalena and the rest of the Buccinari Isles, and the neighbouring coast of Sardinia, *C.* is rocky, bare, and unfertile. It has no streams, and is in few places adapted either for the pasture of cattle or for the plough. In former times, it was the abode only of wild goats—whence its name (Lat. and Ital. *capra*, a goat)—and rabbits, and was occasionally visited by goat-herds and fishermen. It has recently acquired celebrity as the ordinary residence of Garibaldi, who acquired a property and built a house here in 1854. He dwelt here from 1854 to 1858, and again made it his abode in the autumn of 1860. It was to *C.* that he was recently (September 1867) sent in honourable banishment by the Italian government, after having been taken prisoner at Asinulunga, in consequence of his design of entering the Roman territory to promote an insurrection and overthrow the papal government.

CAPRO'IC, CAPRY'LIC, AND CAPRIC ACIDS are represented by the formulæ $C_{13}H_{25}O_4$, $C_{16}H_{31}O_4$, and $C_{18}H_{35}O_4$, and are members of the acetic or fatty-acid series. They derive their names from *capra*, a goat, in consequence of their more or less resembling in smell the odour of that animal. They may all be obtained from butter by pressing out the portion which remains liquid at 60°, saponifying this oil, and distilling the soap which is thus formed with sulphuric acid. The liquid which passes over contains these three acids, together with butyric acid, which, by being converted into baryta salts, are separable from one another. All three of these acids are also obtained by the oxidation of oleic acid by nitric acid; and capric acid is also obtained by acting upon oil of rue with fuming nitric acid; hence it is frequently called *rutic acid*.

CAPULETS AND MONTAGUES, the English spelling of the names of the Cappelletti and Montecchi, two noble families of Northern Italy, chiefly memorable from their connection with the legend on which Shakspeare has founded his play of *Romeo and Juliet*. According to tradition, both families belonged to Verona; but this does not appear to have been the case. The Cappelletti were of Cremona, and the fact that their burying-ground and the tomb of Juliet are shewn at Verona, only proves how easy it is, in a country of ruins like Italy, to connect fact with fable. It has also been asserted that one family was Guelf and the other Ghibelline; but this is disproved by a reference to them in the *Purgatorio* of Dante (canto vi. l. 106). The poet is blaming the Emperor Albert for neglecting Italy, the very garden of his domain. 'Reckless man,' he says, 'come see how the Montecchi and the Cappelletti are oppressed;' and the context shews that the Guelfs were the oppressors in both cases of these great Ghibelline families. The Emperor Albert was murdered in 1308, and this event has supplied the Veronese with a date for their legend. The first publication in which we recognise the essential incidents of Shakspeare's play is the novel *La Gulietta*, by Luigi da Porto, printed in 1535, after the death of the author. He states, in an epistle prefixed to the work, that the story was told him 'by one Perigrino, a man fifty years of age, much experienced in the art of war, a pleasant companion, and, like almost all the Veronese, a great talker.' In 1554, Bandello published in his collection of tales another Italian version of the legend. It was entitled *The unfortunate Death of two unhappy Lovers, one by Poison and the other of Grief*. Both writers fix the date of the event by saying it took place when Bartholomew dalla Scala or Scaliger ruled Verona. A French version of the tale was published by Pierre Borstein in Belleforest's *Histoires Tragiques*. It was translated into English in 1567, and published in Painter's *Palace of Pleasure*. About the same time, Arthur Brooke published an English poem on the same subject, entitled *The Tragical History of Romeus and Juliet, written first in Italian by Bandell, and now in English*. There is evidence that an English play had appeared previously, and that before Shakspeare's time the story was so well known in England that it had supplied subjects for tapestries. Shakspeare's play seems to have been principally based on the English poem. It was Brooke who first called the Montecchi Montagues, and the Prince of Verona Escalus, instead of Scala. Wright and Cary, in translating Dante, have followed the example of Shakspeare, and puzzle English readers by referring to the 'Capulets and Montagues' as Ghibelline families. The historical date of the tragedy has not, however, been adopted by modern stage managers and Shakspearian critics, who very properly

bring down the action from the beginning to the close of the 14th c., when commercial opulence, and the revival of arts and letters, supply accessories more in keeping with the drama than the ruder age to which history must assign the 'civil broils' and the fall of the Capulets and the Montagues.—See notes to Dante in *Classici Italiani*, and Knight's and Dyce's *Shakespeare*.

CARBIDES, formerly termed **CARBURETS**, are compounds of carbon with metal. None of them occur in a natural state.

CARBOLIC ACID. Since the article on this substance appeared in the *Encyclopædia*, much has been ascertained regarding its uses, both as a therapeutic agent and as a disinfectant. It has been introduced into the new British Pharmacopœia (1867), where its characters and tests are thus described: 'In colourless acicular crystals, which at a temperature of 95° become an oily liquid, having a strong odour and taste resembling that of creosote, which it also resembles in many of its characters and properties. Its specific gravity is 1.065; boiling point, 370°. The crystals readily absorb moisture on exposure to the air, and they are thus liquefied; the acid, however, is but slightly soluble in water, but it is freely soluble in alcohol, ether, and glycerine. It does not redden like litmus paper; a slip of deal dipped into it, and afterwards into hydrochloric acid, and then allowed to dry in the air, acquires a greenish-blue colour. It coagulates albumen. It does not affect the plane of polarisation of a ray of polarised light.' It may be taken internally in doses of from one to three grains in the same class of cases as those in which creosote is prescribed. Its principal uses are as external applications, in which, in various degrees of dilution, it is serviceable in unhealthy ulcerations, gangrenous sores, ozæna and all fetid discharges, gleet, the destruction of lice, and especially, as Professor Lister has shewn, as an application in compound fractures (in which it coagulates all albuminous effusions, and forms a solid crust, impermeable to air, over the broken surface), and to abscesses immediately after they have been opened. Indeed, it is most probable that his investigations on the treatment of abscess will, like those on the treatment of compound fractures, lead to a total alteration in this department of surgery. The observations of Pasteur and others have shewn that, in even apparently the purest air, numerous organic germs are always floating. In a hospital ward, these germs are multiplied to an extraordinary degree. In any wound exposed to the atmosphere (as a compound fracture), decomposition takes place by the action of these germs, and hence it is necessary to introduce the carbolic acid, which has the power of destroying these germs, into the interior. In an unopened abscess, no septic organisms are present, and the object of the surgeon is to guard against their introduction from without, and at the same time to afford a free exit for the discharge of the contents of the abscess. The following are the outlines of Professor Lister's mode of proceeding: A square piece of rag is dipped in a solution of one part of crystallised carbolic acid and four parts of boiling linseed oil, and is laid upon the skin where the incision is to be made. The lower edge being raised, a scalpel dipped in the oil is plunged into the cavity of the abscess, and a sufficient opening made; and the moment the knife is withdrawn, the raised part of the rag is dropped upon the skin as an antiseptic curtain, beneath which the pus escapes. The cavity of the abscess is firmly pressed, so as to remove as nearly as possible all the existing pus, and if it should seem expedient, a piece of lint dipped in the

oily mixture may be introduced, so as to check bleeding and prevent primary adhesion of the cut surfaces. 'Thus,' says Professor Lister, 'the evacuation of the original contents is accomplished with perfect security against the introduction of living germs. This, however, would be of no avail unless an antiseptic dressing could be applied that would effectually prevent the decomposition of the stream of pus constantly flowing out beneath it.' He finds that the most suitable dressing is made as follows: Six tea-spoonfuls of the oily solution are mixed with common whiting (carbonate of lime) so as to form a putty, which is spread upon six inches square of common tinfoil, strengthened with adhesive plaster to prevent its tearing. The tin thus spread with putty is laid upon the skin, so that the middle of it corresponds with the point of incision, the antiseptic rag used in opening the abscess being removed the moment previously. The tin is then fixed with adhesive plaster, the lowest edge being left free for the escape of the discharge into a folded towel placed over it, and secured with a bandage. The dressing must be removed every day, and a piece of rag dipped in the oily solution must be placed on the incision when the first tin is removed, so as to guard against the possibility of the entrance of germs during the cleansing of the skin with a dry cloth, and pressing out any discharge that may exist in the cavity. If a piece of lint was inserted into the wound, it must be removed when the tin is applied. From the absence of the irritation excited by decomposition, pus almost at once ceases to be formed under this treatment; and large abscesses, after their original contents have been evacuated, often yield in 24 hours only a few drops of serum in the course of a few days. The Pharmacopœia gives the glyceride of carbolic acid (consisting of one part of the acid to four of glycerine) as a good form for local application; but the proportion of acid must vary with the case.

The value of carbolic acid as a disinfectant is placed beyond all doubt by the investigations of Mr Crookes, made at the request of the Royal Commissioners, who were appointed to obtain information and report on the cattle disease. As an account of his experiments is reprinted, in a very cheap form, from the Appendix to their Third Report, and is accessible to every one, we will merely insert the recommendation of the Commissioners: 'That the use of carbolic acid should become general throughout the country in uninfected as well as in infected districts. There is little doubt that even were there no danger from cattle-plague, the great purifying effect of the substance on the air of cattle-sheds would contribute greatly to the health of the animals.'

CARIPE, a town of Venezuela, South America, situated in a fertile valley of the same name, 50 miles south-east of Cumana. The valley is noted for a cavern frequented by the remarkable bird called Guacharo (q. v.). Pop. of town and valley, 5000.

CARLISLE, the capital of Cumberland county, Pennsylvania, U. S., 18 miles south by west of Harrisburg, the centre of a rich agricultural country; seat of Dickinson College, a flourishing Methodist institution; with 12 churches, 2 banks, 5 newspapers, machine-shops, rail-car factory, and United States barracks; was shelled by the Confederates, July 1, 1863. Pop. (1860) 6664.

CARLOS, SAN, a town of Venezuela, South America, in a valley on the Aguaré, a feeder of the Orinoco, 120 miles south-west of Caracas. Before the wars of independence it was a place of considerable importance, having been one of the richest towns in the province. The town is handsome and

well laid out. The pop. was formerly 10,000, but is now considerably less. The inhabitants are engaged chiefly in the rearing of cattle, and the cultivation of indigo, cotton, and coffee, of which there are still considerable plantations in the neighbouring savannahs.

CARLSHAMN, a fortified town on the south coast of Sweden, about 30 miles west of Carlskrona, at the end of a beautiful valley. The harbour is small but secure, and a considerable trade in iron, timber, pitch, and tar is carried on. There are manufactures of sail-cloth, tobacco, hats, soap, and leather; there are also dye-works and ship-building yards. Pop. (1864) 5892.

CARNARVON, HENRY HOWARD MOLYNEUX HERBERT, fourth Earl of, born in Grosvenor Square, 1831. His family is a branch of the House of Herbert, Earls of Pembroke, springing from Major-general the Hon. W. Herbert, whose son, Henry, was created, in 1780, Baron Porchester of Highclere, Hampshire, and advanced to the earldom of Carnarvon in 1793. The present earl was educated at Christ Church, Oxford, where he was first-class in classics in 1852. His father dying before he was of age to sit in the House of Commons, he lost the advantage of the training in public speaking and statesmanship which the sons of peers usually enjoy during the lifetime of their parents, in the Lower House. He took his seat on the Conservative benches, and soon shewed himself ambitious of parliamentary distinction. His earlier speeches in the House of Lords were not thought to exhibit much vigour and grasp of intellect, and were marred by a simpering and affected delivery. He was appointed governor of Carnarvon Castle in 1854. In 1858, he became Under-secretary of State for the Colonies, in the administration of the Earl of Derby, and displayed much industry and business aptitude in the discharge of his official duties. In 1859, he was elected High Steward of the University of Oxford. He resigned office with the Conservative ministry in 1859, and availed himself of the period of leisure thus obtained to visit the East. The feuds of the tribes in the Lebanon had broken out in a massacre of the Christians; and the Earl of C. gave the world the benefit of his investigations, in an interesting work, entitled the *Druses* (q. v.) of the *Lebanon*. On his return, he delivered lectures in the country, and speeches in the House of Lords, on prison-discipline, education, and other social subjects. When the Conservatives again returned to power in 1866, C. was offered by Lord Derby the high office of Secretary of State for the Colonies, with a seat in the cabinet. His appointment was regarded with some misgiving, doubts being entertained whether he had acquired the weight and aptitude for affairs which belong to experience. He soon, however, obtained for his colonial administration a large share of public confidence. He censured in calm and measured language the misconduct of the courts-martial during the Jamaica insurrection, and especially the trial and execution of Mr Gordon; and the pacification of the colony satisfactorily progressed under his instructions. During the recess, he developed and framed a plan for the confederation of the British North American colonies; and when parliament met in 1867, he explained the provisions of the measure in an elaborate speech. The bill met with general approval in both Houses, and it passed; but before it obtained the royal assent, C. had, with two other colleagues in the cabinet, resigned office upon the Reform Bill of the Derby government, which he regarded as democratic in its operation, and dangerous in its results. When the Reform Bill came before the House of

Lords, C., in an animated speech, vindicated his consistency at the expense of his colleagues; and in the discussions in committee, he addressed the House with a degree of vigour and argumentative ability, which give promise that he will occupy a prominent place in the future debates of the Upper House. As a speaker, he is fluent, but somewhat pretentious in manner, and his voice so weak and thin, that he is unequal to the delivery of a long oration. He married, in 1861, the only daughter of the sixth Earl of Chesterfield.

CARORA, a town of Venezuela, South America, in the province of Caro, 210 miles west-south-west of Caracas, and 60 miles east of Lake Maracaybo, on the Tocuyo. The town is well built, has a handsome parish church, convent, hermitage, &c. There are manufactures of leather, ropes, and fine hammocks from the fibre of the *Agave fetida*. A trade is carried on in agricultural produce, and in the aromatic balsams, resins, gums, and wild cochineal for which the district is famous. The pop., which was formerly much larger, is now about 6000.

CAROUGE, a town of Switzerland, in the canton and about one mile south of Geneva, on the left bank of the Arve. It is beautifully situated, regularly built, and surrounded by villas, orchards, and meadows. It has a handsome Roman Catholic and a Protestant church. There are manufactures of thread, clay pipes, leather, watches, and pottery. There is a bridge across the Arve connecting the town with Geneva. Pop. 5817.

CARRAPATO, a species of Tick (q. v.) of the genus *Ixodes*, which infests dry bushy places in the interior of Brazil, hanging in clusters of many hundreds on very slender twigs, and ready to attach itself to any quadruped or man that passes, instantly burying its beak in the skin, from which it cannot be detached without considerable force. Horses and oxen suffer very much from the attacks of the C., of which in dry seasons the numbers are so great, that whole herds of cattle are destroyed by the exhaustion which they produce.

CARVIN-EPINOY, a town of France, dep. of Pas-de-Calais, 11 miles south-south-east of Lille, and about the same distance by railway. There are manufactures of beet-root sugar, starch, earthenware, and leather. Pop. (1866) 5180.

CA'SIA, or **POET'S CASIA** (*Osyris alba*), a shrub of the natural order *Santalaceae*, a native of the south of Europe, 3-4 feet high, with linear-lanceolate deciduous leaves, long supple branches, numerous small white flowers, and red drupes (stone-fruit) of the size of a pea. The branches are used for making crates. The shrub has been much admired for its modest beauty. Keats speaks of

'The drooping flowers
Of whitest casia, fresh from summer showers.'

CASSIDARIA, a genus of molluscs—class *Gastropoda* (q. v.), order *Pectinibranchiata*—with univalve shells, generally regarded as belonging to the family *Buccinidae* or *Whelks* (q. v.), but as forming a connecting link with the family *Muricidae* (see **MUREX**). The shell is ventricose, with a moderately elevated spire, the aperture elongated, and the canal recurved, but not very abruptly—much less abruptly than in the nearly allied genus *Cassia* (see **HELMET SHELL**)—the columellar lip covered with a plate, and the outer lip similarly margined within. The recent species, which are not numerous, belong to tropical and subtropical seas. Fifty fossil species have been described. The genus first appears in the Upper Cretaceous measures, where a single species occurs. In the Eocene 11 have been found,

and about 40 in the Pliocene. It has its fullest development as a recent shell, no less than 70 species being known.

The name *Cassidaria* is sometimes given to a family of coleopterous insects, of which the type is the genus *Cassida*. See TORROISE BEETLE.

CASTIGLIONE, a town of Sicily, province of Catania, on the north slope of Mount Etna, on the right bank of the Cantara, 35 miles south-west of Messina. The town stands on a square rock rising abruptly from the valley, and having a double crest, on which stand a domed church and the ruins of a feudal castle. Here, in 1297, in the war of the Vespers, Admiral Roger Toria raised the standard of rebellion against his sovereign, Frederick of Aragon. In the district are several large nut-plantations, which produce the best Sicilian hazelnuts. Pop. (1861) 4220.

CATHA, a genus of the natural order *Celastraceae*. The fruit is a three-cornered capsule.—*C. edulis*, sometimes called **ARABIAN TEA**, the **KHÂT** of the Arabians, is a shrub with erect smooth branches, elliptical obtusely serrated leaves, and small flowers in axillary cymes. It is a native of Arabia, and the Arabs ascribe to its leaves, even carried about the person, extraordinary virtues as a preventive of plague, with probably about as much reason as our forefathers had for esteeming the rowan tree formidable to witches. When fresh, they are stimulant, narcotic, and intoxicating, and are eaten with greediness by the Arabs. They are very antisporific, so that a man, after using them, may keep watch for a whole night without drowsiness.

CATTLE-PLAGUE, RINDERPEST (Ger.), or **STEPPE MURRAIN**, is a contagious eruptive fever, or exanthema, of the bovine species; sheep, goats, deer, and other allied species occasionally, however, catch it from cattle. It occurs indigenously on the plains of Western Russia, whence it has at various times overspread most parts of the Old World. The specific virus from diseased or infected animals is the only source of cattle-plague; no filth, overcrowding, or other health-depressing cause has hitherto produced it. As in smallpox, scarlatina, and other eruptive fevers, an incubative stage, varying between two and twenty days, intervenes between the introduction of the virus into the system, either by inoculation or contagion, and the development of the characteristic symptoms. These consist essentially of congestion of the mucous and cutaneous surfaces, with a sort of aphthous eruption, and thickening, softening, and desquamation of the superficial investing membrane. The disease runs a tolerably fixed and definite course, which is not materially altered by any known remedial measures. It seldom attacks the same individual a second time.

History.—The cattle-plague has been recognised for upwards of a thousand years. It appears to have destroyed the herds of the warlike tribes who overran the Roman Empire during the 4th and 5th centuries. About 810, it travelled with the armies of Charlemagne into France, and about the same period is also supposed to have visited England. Several times throughout the course of every century it spread from the plains of Russia over the western countries of Europe, and is stated to have again visited England about 1225. Although occasioning, every few years, great losses on the continent of Europe, the plague does not appear to have again shewn itself in England until 1714, when it appeared at Islington about the middle of July, was very destructive for about three months, but was again got rid of towards Christmas. In 1744, it was in Holland, destroying there, in two years, 200,000 cattle; in Denmark, from 1745—1749, it killed

280,000; in some provinces of Sweden it spared only 2 per cent. of the horned cattle. It made terrible havoc throughout Italy, destroying 400,000 beasts in Piedmont alone. In April 1745, the plague was again imported into England, probably by some white calves from Holland, where, as already stated, it had for some time prevailed. It continued its devastations for twelve years, but it is now impossible accurately to discover the losses it occasioned. In the third and fourth years of its ravages, 80,000 cattle were slaughtered, and double that number are supposed to have died. In 1747, 40,000 cattle died in Nottingham and Lancashire alone; whilst, so late as 1757, 30,000 perished in Cheshire in six months. In March 1770, the disease was brought with some hay from Holland to Portsoy, in the Moray Firth; several cattle died, and others, to the value of £79, 12s. 2d., being destroyed, the further spread of the pest was prevented. By the wars which wasted Europe towards the close of the last and first eighteen years of the present century, cattle-plague was spread widely over the continent, and occasioned, wherever it occurred, terrible losses. Since then, at short intervals, it has spread—always being traceable to its source on the Russian plains—over Poland, Hungary, Austria, Prussia, portions of Germany and Italy, and from the Black Sea has extended to Egypt.

The British outbreak of 1865—1867, like its predecessors, undoubtedly came from Russia. The steamer *Tonning* from Revel, brought 331 cattle and 330 sheep into Hull on 29th May 1865. A portion of the cattle had come from the interior of Russia, where the plague then was, or recently had been; the cargo was rapidly landed, and very hurriedly inspected. Nearly half of the cattle were distributed in various lots to butchers in Leeds, Derby, and Manchester, but, curiously, these do not appear to have left any contagion in their trail. One hundred and seventy-five came to London, remained from the Monday evening until Thursday's market in lairs at York Road, adjoining the cattle-market. It is stated, in a leader in the *Times* of 15th August, that rinderpest was seen in the metropolitan market as early as 12th June. Certain it is that more than one lot purchased on 19th June carried the disease to several dairies in and about London. The first cases were mistaken for cases of poisoning, the cows they had stood beside were sent into market, and thus the subtle disorder in a few weeks spread into many dairies, both in town and country. Twenty-three Dutch cattle, after having stood over for several markets, were sent back to Holland on 2d July, carried with them the contagion, were placed in a field near Schiedam, but soon sickened and died, thus spreading the disease in Holland. During the next six months, plague cases were repeatedly reimported thence into England. Until 11th August 1865, no restrictions whatever were put upon the removal of cattle; diseased and infected animals were freely taken to fairs and markets, were openly travelled by road and rail; whilst the metropolitan market continued every week to send forth infected cases, not only to the neighbouring counties, but to Hampshire, Birmingham, Hereford, Liverpool, Edinburgh, and even to Aberdeenshire. As early as 18th July, the pest was brought from London to Huntly by four calves; subsequent outbreaks occurred in the same way. The stamping-out system was, however, early and rigidly enforced in Aberdeenshire, and eight distinct outbreaks of the plague were promptly got rid of.

In Edinburgh, it appeared probably about 9th August, was brought from London by some low-priced foreign cows; in six weeks, about 800, or one half the dairy cows in Edinburgh, had died—200

CATTLE-PLAGUE

having been buried in one trench. By the end of January, four-fifths of the dairy cows had perished, but Edinburgh was reported clear. In Glasgow, the first case occurred on 19th August, in a cow sent from Edinburgh. By 30th September, 432 cases were reported, and it continued to spread. By the middle of October, it was in Mr Harvey's valuable stock of 800, of which 25 died in one night, and to save further loss, 50 healthy animals were in one day disposed of to the butcher. From Falkirk Trysts, as from Barnet, Norwich Hill, and other large English fairs, the disease was transmitted into fresh localities. From the autumn trysts, it was carried into Perthshire, Forfarshire, and Fifeshire. Diseased cattle passing along in railway trucks, appear to have spread the contagion over the fields adjoining the line at Thornton, Fifeshire. Into West Lothian it was conveyed early in September by lambs from the Edinburgh market.

The rapid spread of the insidious disorder may be gathered from the fact that, whilst, during the week ending 24th June 1865, there was only one outbreak at Mrs Nicholl's dairy at Islington, and 30 animals affected, by 30th September there were 1702 farms, sheds, or other places in which the pest had appeared, and 13,263 animals had been attacked. Three months later, 8252 separate places had been visited, and 62,743 animals attacked. During six months, the aggregate of cattle attacked was 76,002. During the three months to 30th March, 13,443 farms and other premises had been infected, and 147,275 cattle attacked. In December 1865, the fresh cases each week reached 9000; but in spite of remedial and preventive measures, of orders in council, and restrictions on the movement of stock, the number of weekly cases steadily increased to 15,706 in the third week of February. 'The Cattle Diseases Prevention Act' passed 20th February 1866, and the advantages flowing from the restrictions thus tardily imposed on the trade in cattle, and the slaughter of diseased and infected animals, were speedily apparent. In four weeks, the number of cases was reduced by one half. During the three months ending 30th June, 28,276 cases were reported; during the next three months to 30th September, the numbers fell to 2108; whilst, to 29th December, the three months' cases were but 149; to 30th March 1867, 89 new cases were noted. Throughout April and May the number of cases continued steadily to decline; but during the week ending 25th May a fresh outbreak occurred in the Finsbury district of the metropolis, and 81 animals died, or were slaughtered to prevent the further spread of the pest. With the exception of an isolated outbreak in Essex, which was promptly stayed by slaughter of the ailing and suspected animals, the country was free of plague during August. By the 'Consolidated Order of Council' (August 1867), foreign cattle, from 13th September 1867, are to be slaughtered at the ports of debarkation, and the reintroduction of cattle-plague into Great Britain is thus tolerably effectually guarded against.

The total number of animals affected in Great Britain to 31st August 1867, has been 278,923; about 125,000 have died, whilst nearly 60,000 healthy cattle have been slaughtered to prevent the further spread of the disease. The numbers of cattle in England, Wales, and Scotland, attacked, killed, &c., may be thus approximately stated; about 11,000 cases known to have been attacked are, however, unaccounted for.

| | Attacked. | Killed. | Died. | Recovered. |
|------------------|----------------|----------------|----------------|---------------|
| England, . . . | 223,672 | 102,740 | 90,450 | 21,589 |
| Wales, | 8,888 | 1,180 | 5,794 | 1,117 |
| Scotland, . . . | 46,963 | 6,263 | 28,088 | 10,707 |
| Total, | 278,923 | 110,183 | 124,332 | 33,413 |

Causes.—The development of cattle-plague by filth, overcrowding, miasmata, hot weather, or other such causes, is untenable. Faulty hygiene, by lowering vitality, probably renders the animal more prone to the attack, and less able to bear up against it, but it cannot originate plague. Like hydrophobia, smallpox, or syphilis, it is developed only by the special virus, which appears to have its habitat on the Russian steppes. This virus occurs abundantly in the blood of every plague-stricken beast, in the discharges from its nostrils, mouth, or eyes, in the off-scourings from the bowels, probably even in the breath. It may be transferred to healthy beasts by inoculation. A little of the blood or nasal or other mucous discharges of a plague case, if introduced underneath the skin of a healthy cow, develops the disease within a few days. The transference of the virus or contagion from the sick to the sound animal, is not always so direct and evident. As with other catching diseases, the virus may be carried considerable distances in the air; its particles are minute, but they have powerful vitality; it may adhere to the food that has lain before infected beasts; to the litter from the stalls, or even after it has been heaped for weeks; to the clothes of attendants; to the floors, walls, or stalling of buildings; to imperfectly cleaned cattle-trucks. So subtle and potent is the plague poison, and so endowed with the power of self-multiplication and growth, that a very minute portion of it finding access to the blood of a healthy animal of the bovine race increases so rapidly, that, to use the words of the Commissioners' Report, No. III. p. 4, 'the whole mass of the blood, weighing many pounds, is infected; and every small particle of that blood contains enough poison to give the disease to another animal.' It may gain access to the blood probably through the air-passages, perhaps also by absorption through the mucous surface of the bowels, or even through the skin.

Symptoms.—In from three to six days after an animal has been exposed to the virus of cattle-plague, or about 36 to 48 hours after being purposely inoculated, the temperature of the body is raised by several degrees. A delicate thermometer, if introduced into the vagina or rectum, instead of marking about 102° F., indicates 104° to 106°. As yet, the appetite, secretion of milk, breathing, and pulse are scarcely if at all affected, and but for the elevation of temperature, accompanied sometimes by dulness, the animal might be supposed to be in the best of health. Two or three days later, or usually within six or eight days after the beast has taken in the subtle virus, the mucous membrane of the mouth is generally observed to be slightly reddened, and soon a granular yellowish-white eruption, consisting of thickened epithelium cells and granules, appears on the gums round the incisor teeth, and by and by on the lips and dental pad. Some hours later, the same eruption extends to the cheeks, tongue, and hard palate. Within 48 hours, or about the sixth day of attack, a crust of epithelium covers the gums, lips, and mouth, and when wiped away, or accidentally rubbed off, leaves the abraded membrane red and vascular, and exhibiting patches of erosion. The membrane lining the vagina indicates very similar appearances; it is reddened and vascular, dotted with grayish translucent elevations about the size of rape-seeds, covered with a whitish-yellow, usually sticky discharge, and occasionally marked with patches of excoriation. The skin, like the mucous surfaces, is congested; there is hence a perverted development of scarf skin, and of the oleaginous secretion of the irritated sebaceous glands. The skin is thus invested with a furfureous desquamation; whilst on its thinner portions

CATTLE-PLAGUE.

about the lips, between the thighs, and on the udder, there are papular eruptions or elevations. About two, or even three days after the temperature has been increased, and usually one, or even two days after the appearance of the characteristic eruption on the gums, the constitutional symptoms present themselves. The animal is dull, hangs its head, arches its back, the eyes are leaden and watery, and from both eyes and nose there latterly comes a dirty alimy discharge. Appetite and rumination are irregular, and in dairy cows, the secretion of milk rapidly abates. The breathing, especially towards the sixth day, is oppressed, expiration is prolonged, and accompanied by a peculiar grunt. The pulse is small and thready, and quickened as death approaches. The bowels, usually at first confined, become, towards the sixth or seventh day, much relaxed; the discharges passed, often with pain and straining, are profuse and liquid, offensive, acrid, pale coloured, and occasionally mixed with blood. The patient loses weight and strength, totters if it attempt to walk, and prefers to lie rather than to stand. Death usually occurs about the seventh day, and is preceded by muscular twitchings, a peculiar sickly, often offensive smell, a cold clammy state of body, moaning, grinding of the teeth, and rapidly increasing prostration.

Prognosis.—Cases usually terminate unfavourably when about the fifth or sixth day the animal temperature falls rapidly; the pulse becomes small, quick, and weak; the breathing more difficult, distressed, and moaning; the diarrhoea increased; and the depression more notable. A more favourable termination may be anticipated when, after the fifth day, the heightened temperature, so notable even from the earliest stages, abates gradually; the breathing becomes easier; the pulse firmer; the visible mucous membranes appear healthier; and patches of extravasation, or erosion speedily disappear.

Sheep do not take rinderpest spontaneously, and even when kept with diseased cattle, or inoculated with cattle-plague virus, they do not catch the disease so certainly as cattle do. When diseased, they exhibit, however, very similar symptoms, but Professor Röhl, and other observers, record that upwards of 40 per cent. recover. Goats, deer, antelopes, gazelles, yaks, and indeed all animals taking rinderpest, exhibit with tolerable uniformity the same characteristic symptoms.

Post-mortem Appearances.—The mucous membranes are generally deeper coloured than natural, are congested, softened, marked in places with the same granular patches discoverable during life within the mouth and the vagina, and in bad cases exhibit œdema, hæmorrhage, and sloughing. The first three stomachs sometimes contain a good deal of food, but shew less declension from health than the fourth stomach, of which the mucous membrane is dotted with spots of congestion and extravasation. The coats of the bowels are thinned and easily torn. The mucous coat, especially towards the middle of the small intestines, the opening into the cæcum, and posterior half of rectum, is much congested, bared of epithelium, and sometimes ecchymosed, but never ulcerated. Peyer's glands, so generally inflamed in the somewhat analogous typhoid fever of man, are perfectly healthy. The liver, spleen, and pancreas seldom present any special appearances. The respiratory mucous membrane, like the digestive, is vascular, and marked with submucous hæmorrhage; the lungs are generally emphysematous, the heart often marked with petechial spots. The urino-genital, like the other mucous membranes, is congested in females, especially towards the lower part of the vagina and vulva; the kidneys

are sometimes rather softened; the serous membranes and nervous centres are perfectly unchanged. Dr Beale, by his microscopical observations, discovers in the capillaries a great increase of nuclear or germinal matter, and white blood-corpuscles, which he believes may account for the local congestion. The blood itself is dark in colour; in the later stages it contains less water, probably owing to the draining diarrhoea, and about double its usual proportion of fibrine. The muscular tissues are softened, easily broken down, and contain an abnormal amount of soluble albumen. The urine is little altered in quantity, but from the first rise in the animal temperature, it contains an increase of urea varying from 5 to 15 per cent. The chief change in the milk is its rapid diminution in quantity, and the increase of its fatty matter. The bile is watery, offensive, and prone to decomposition.

Treatment.—Cattle-plague is proved to be an eruptive fever. When the specific poison, on which such disorders depend, has entered the body of a susceptible subject, no remedy has yet been discovered which can destroy it, or even materially shorten or mitigate its effects. Until such an antidote is found, there can be no hope of a certain cure. The Cattle-plague Commissioners have collected information regarding the four following methods of treatment—namely, the antiphlogistic, the tonic and stimulant, the antiseptic, and the special. Diverse as are these systems, the percentages of recoveries, varying from 25.83 to 27.45, were so nearly alike, that it is fair to conclude that no one of the systems tried exercised any notable influence in checking the mortality. Partly, perhaps, from the varying virulence of the plague, partly from the differences in the nursing and care bestowed on the animals, the proportion of recoveries has varied greatly in different localities. Up to the end of 1865, in Huntingdon they were only 4.668 per cent.; in Norfolk they were 12.102; in Flint, 15.909; in Scotland, 19.889; whilst in Fifeshire they reached 24.552; and in Yorkshire, 29.731 per cent.

Like smallpox, measles, and other eruptive fevers in man, rinderpest runs a definite course which cannot safely be interfered with. Rational treatment is therefore limited to warding off untoward symptoms, careful nursing, and husbanding the failing strength. It must, however, be remembered that throughout the progress of the disease there is constantly given off from the sick body minute particles, which are capable of developing the disorder in healthy cattle. Hence plague-subjects, by the orders in council, are very properly desired to be immediately destroyed. Except, therefore, for purely scientific purposes, and with careful precautions to prevent the spread of the poison, it is unwise to attempt remedial treatment. Where, however, a beast is to have a chance of recovery, so soon as the elevated temperature indicates the accession of the disease, solid indigestible food should be withheld, and the patient restricted to mashes, gruel, boiled linseed, malt, and other food, which can be digested without the necessity for rumination. The paramount importance of such a dietary is clearly demonstrated in the returns of the Edinburgh Cattle-plague Committee to the government commissioners. The recoveries amongst 310 cattle 'fed with dry food, and treated medicinally with drugs,' were 13.6. Amongst 303 cattle treated with mixed food and hay, 22.2 recovered. Where mashes were given during sickness, but dry food supplied during convalescence, the recoveries reached 51.5; whilst in 95 cottagers' cows, whose chief ordinary dietary consisted of mashed food, and which were fed in

the same manner throughout both sickness and convalescence, and were besides carefully nursed but not doctored, the recoveries reached 737. Where the bowels at the outset are constive, a dose of oil, or a very small quantity of some saline purgative, may be required. Cold water, gruel, mashies, or stale bread soaked either in water or beer, should be offered at short intervals throughout the attack. The animal, kept in an atmosphere of about 60°, should be comfortably clothed, and have its legs bandaged. The hot-air bath and wet-packing has been repeatedly tried, but although probably useful in the earlier stages, appear, when the disease is fully established, to harass and weaken the patient. Small and repeated doses of sulphite of soda have in some cases proved useful, and may be conjoined with carefully regulated moderate doses of such stimulants as ale, whisky and water, sweet spirit of nitre, spirit of ammonia, or strong coffee. It is most important, however, that these and other such medicines should be drunk by the animal of its own accord in its gruel, water, or mashies, as the forcible horning over of dranches always disturbs the patient. The inhalation of chloroform, although temporarily relieving the distressed breathing, does not appear to exert any permanent benefit.

Prevention.—From what has been stated regarding the nature and cause of cattle-plague, it must be evident that its prevention can only be effected by the destruction of the specific virus, or by removing beyond its influence all animals on which it might fasten. Sparks fall harmless where no inflammable materials lie within reach. Into Great Britain and Ireland, fresh importations of plague must be guarded against by greater care and increased restrictions in the introduction of foreign cattle. These should be admitted only into certain legalized ports, provided with suitable markets, lairs, and abattoirs, whence no fat stock should be permitted to be removed alive. Store stock from abroad, or home-bred animals that have stood in the metropolitan or other large markets where foreign beasts are admitted, should be placed in quarantine yards or fields, under proper inspection, for at least fifteen days. By neglect or evasion of such precautions, plague, during 1865 and 1866, was almost every week carried from the Ialington and other large markets. By attention to such regulations, not only would cattle-plague be prevented or confined to the narrowest limits, but the spread of pleuro-pneumonia and mouth-and-foot disease would also be similarly checked. Sheep, fresh hides, hay or other fodder, and litter from countries where plague exists or has recently visited, ought not to be allowed to enter British ports.

Rinderpest being found to resemble smallpox in men and sheep, it was thought that its propagation and virulence might be abated by vaccination with cowpox lymph; but cattle, even when effectually vaccinated, which is often a difficult task, readily take rinderpest, often in its most mortal forms. Inoculation with the discharges from mild cases and from young calves has been tried as a palliative; but the disease, thus artificially developed, loses nothing either of its severity or of its dangerous contagious character. Cattle in Oxfordshire receiving for several weeks daily doses of sulphite of soda are stated to have had the plague in a mild form.

Where an outbreak occurs, the diseased animals must be promptly destroyed, and all cattle in immediate contact with them should likewise be slaughtered. This 'stamping-out system' prevents the multiplication and diffusion of the virus, and hence saves still further losses. It is rigidly and successfully carried out in many continental coun-

tries. By stamping out and strict isolation, eight or ten outbreaks in Aberdeenshire were got rid of without serious loss. A French outbreak on the Belgian frontier in September 1865 was stamped out with the sacrifice of forty-three animals. The disease was imported to Paris in November by two gazelles purchased in London by the French Acclimatization Society. Before it was stayed by slaughter and segregation, thirty-four animals, including yaks, antelopes, deer, gazelles, goats, and peccari, died or were destroyed. The determined slaughter of diseased and infected animals, and the restrictions on the movement of all stock, were the only means that reduced the number of attacks during the British outbreak of 1865 and 1866. As is officially recorded in the Commissioners' Report, No. IV., p. 6, 'where the percentage of killed is high, the ratio of increase of the disease is low, and vice versa.' This has generally been noticed under each county and district.

When plague is in the neighbourhood, it is desirable daily to sprinkle the walls, wood-work, and floor of the sheds and hovelling with carbolic acid solution, and to keep up throughout the premises a continual odour of this useful antiseptic, and even with a diluted solution of the acid, or with M'Dougall's disinfecting soap, to wash over the cattle twice a week. The animals should be carefully fed on digestible soft food; receive daily about an ounce of sulphite of soda in a mash; and, in order to note the first access of the disease, should have their temperature examined by the thermometer every night and morning.

The recommendations of the Cattle-plague Commissioners for the purifying of infected sheds, litter, and manure must receive careful attention. In whatever premises infected beasts have stood, the walls should be lime-washed, a pint of carbolic acid being added to each pailful of the whitewash. The floors and wood-work, after being washed and scrubbed with boiling water, should be sprinkled with a strong solution of carbolic acid. The sheds being emptied of their living inhabitants, and the doors and windows closed, sulphur should be burned, and the vapours allowed to float about for a couple of hours before the sheds are again thrown open to the purifying influences of abundance of fresh air. A pound of sulphur placed on a shovel of burning coals will suffice for a twelve-stalled shed or byre. Where cattle-plague has raged, this cleansing and fumigation should be repeated, and, if possible, several weeks allowed to elapse before the premises are again occupied by sound animals. All shovels, forks, buckets, or brooms that have either directly or indirectly come in contact with diseased or infected animals, should be washed with the carbolic acid solution. The clothes and boots of attendants, inspectors, and others coming in contact with plague-stricken animals must be similarly cleansed. The manure should be sprinkled with carbolic acid at intervals of a few days, and then covered over with a foot of earth, freely mixed with soil, or carted away and ploughed in. It is safer thus to put the manure on the arable land than to use it as a top-dressing for the pastures.

Authorities.—Official Reports of the Commissioners appointed to inquire into the Cattle-plague, Nos. I, II, III, and IV.; *The Cattle Plague*, by Professor John Gamgee.

CAVARZERE, a town of Northern Italy, province of Venice, 22 miles south-south-west of Venice city. Pop. 11,903. It is situated on the Adige, which divides it into two parts called *C. destro* and *C. sinistro*. Its soil is fertile, and its inhabitants carry on an active trade in cattle, silk, and wood for fuel.

CE'GLIE, a town in Southern Italy, province of Lecce, 18 miles north-east of Taranto. Pop. (1861) 11,261. It produces much grain, and has fine pastures.

CENEDA, a city of Northern Italy, province of Treviso, 36 miles north of Venice. Pop. 8178. It stands at the base of a mountain. It is an episcopal see, has a very handsome modern cathedral and a fine monolithic fountain. Under the republic of Venice, it was rich, and famed for its manufactures of woollen cloth, silk, and paper. C. is very ancient, dating from the time of the Romans, but now it is a decayed city.

CHAILLU, PAUL B. DU, a distinguished traveller, was born in the south of France, about 1820. His father was for many years a merchant trading on the Gaboon (q. v.) River, in Western Africa, and thither he was carried when a boy. He lived there for several years, and became familiar with the habits and languages of the natives, thus—as well as in his habituation to the climate—unconsciously preparing himself for the explorations which he was afterwards to undertake. In 1842, the French made a settlement and built a fort on the Gaboon. Under the protection of this fort, both the elder and younger Du C. resided and carried on their commercial pursuits for some years. Du C. afterwards went to America, where he resided for a number of years, and was naturalised by the legislature of the state of New York. In October 1855, he sailed from New York to West Africa, where he spent four years in explorations, making many interesting discoveries, and travelling, as he himself tells us, about 8000 miles, always on foot, and unaccompanied by other white men. He returned to America, and after subjecting his specimens in natural history and ethnological notes to the examination of the scientific men of New York and Boston, he crossed the Atlantic to England, and published a volume of travels—*Explorations and Adventures in Equatorial Africa, with Accounts of the Manners and Customs of the People, and of the Chase of the Gorilla, Crocodile, Leopard, Elephant, and other Animals* (Lond. 1861). His travels were in a region lying between N. lat. 1° 30', and S. lat. 2°, and extending from the coast to about E. long. 14° 15'; and the work in which he gives an account of them contains very important contributions to geographical, ethnological, and zoological science. Under the first of these heads must be ranked, as of chief importance, the information concerning the Fernand Vas, Ogobai, and Rembo rivers (see OGOBAI in SUPPLEMENT), and concerning the mountain chain which, between the equator and S. lat. 1°, stretches from west to east from the neighbourhood of the coast far into the interior of Africa. He made known the existence and described the characteristics and habits of a number of African tribes, among which particular interest attached to his account of the Fans (q. v.), a cannibal tribe, inhabiting a region on the western side of the coast-range of mountains, just to the north of the equator. His contributions to zoology related not only to the gorilla and other remarkable apes, some of them previously quite unknown, but included also many new species of mammals and birds. Many of the statements contained in his volume, however, being very extraordinary, it was received with much distrust, and was subjected to very adverse criticism; to which it was the more exposed because the author's journals having been put into the hands of a literary gentleman in America to be prepared for the press, separate journeys were mixed up in the narrative, and the chronology was thrown into confusion. Much discussion took place in newspapers and

periodicals, and some writers went so far as to assert their belief that Du C.'s stories about the gorilla were entirely fabulous, and that he had never seen the animal alive, but had purchased the specimens which he brought to England from natives on the coast. His descriptions of nest-building apes were, of course, also received with incredulity, and the truth of his account of the cannibal Fans was much doubted. The maps drawn up by Dr Barth and Dr Petermann in 1862 moved the positions of all the places which he had visited much nearer the coast than he had fixed them, so as greatly to reduce the length of his routes. The general trustworthiness of Du C.'s narrative was, however, maintained by some men of the highest eminence, and particularly by Sir Roderick Murchison and Dr Owen. Du C. resolved to confute his opponents, and vindicate his own reputation, by another expedition to Africa, for which he prepared himself by a course of scientific study, to enable him to make astronomical and other observations, and by acquiring the art of photography. During his first explorations, he had laid down the position of places from compass-bearings only. The substantial accuracy of his observations was, however, in the meantime confirmed by a French government expedition under Messrs Serval and Griffon du Bellay, which explored the Ogobai River in 1862; and Dr Petermann then reconstructed his map of that part of Africa as Du C. had originally laid it down. His statements regarding the cannibalism of the Fans were also confirmed by Captain Burton, who himself travelled among them. Du C., however, proceeded on his second expedition. He freighted a small schooner, and sailed in her from England on 6th August 1863, carrying with him not only an ample store of scientific apparatus, but also of goods for presents to the natives, or barter with them. He reached the mouth of the Fernand Vas River on 10th October, and was warmly welcomed by the African chiefs whom he had formerly known; but he sustained a grievous misfortune in the loss of all his scientific instruments and many other valuable articles, through the swamping of the canoe by the surf, as they were being landed from the schooner. He was compelled to send to England for another set of instruments, and to wait till they arrived. Meanwhile, he made several excursions in the neighbourhood of the coast, through the almost impenetrable jungle which covers the western coast regions of equatorial Africa, and had abundant opportunity of confirming his former observations regarding the gorilla. He also had live ones caught and brought to him by the natives. In September 1864, Du C. having received his new supply of instruments from England, started on his expedition for the exploration of the interior. He was attended by a body-guard of ten Commi negroes, in thick canvas trousers, blue woollen shirts, and worsted caps, each man having a blanket to keep him warm at night. There was difficulty, however, in getting leave to set out on the expedition at all. It is the universal rule among the coast tribes of West Africa to prevent, if possible, all strangers from penetrating into the interior, even if it be only to the next tribe, through fear that the exclusive privilege of trading with that tribe should be lost. A grand *palaver* was held on the subject, and it was at last agreed that Du C. should be allowed, as a special favour, to ascend the Fernand Vas or Ogobai, as his object was not to trade, but to shoot animals, and to bring away the skins and bones. 'Truly,' the chiefs and councillors said, 'we do not know what Chaillic has in his stomach to want such things, but we must let him go.' Du C.

revisited some of the scenes of his former explorations—the Ogobai, the Rembo, and their branches. He suffered great hardships, being sometimes at a loss even for food, and his attendants being almost all at one time ill of smallpox, which made fearful havoc among the native population, and exposed him to the dangerous suspicion of having caused it by witchcraft. He passed through a forest district so dense that animal life is scarcely found in it, and an almost unbroken silence prevails by day and by night. He found also in his journeings many scenes of extreme beauty, scenes of mountain and meadow, hill and pasture-land, groves of plantains, groves of lime-trees remarkable for dark foliage, stately palms, and clear sparkling streams. An unfortunate misunderstanding took place at last between Du C.'s party and the inhabitants of a village which he had reached. A conflict took place, the natives became exasperated, and it was with difficulty that the traveller escaped, being obliged, however, to resign all thought of proceeding further. He reached the mouth of the Fernand Vaa River on 21st of September 1865, and found a vessel there loading for London. He had lost everything but his journals; all the treasures in natural history which he had collected were gone. He brought home, however, his astronomical observations, which have been carefully examined by the most competent persons, and the map of western equatorial Africa has been made much more complete and correct than before. Du C. did not penetrate, on any of his journeys, much more than 240 miles in a direct line from the coast, but his discoveries have been numerous and important, and amongst them are about eighty new species of mammals and birds. No one now affects to doubt the right of Du C. to be ranked among the most enterprising of travellers, and the truthfulness of his narrative is universally admitted. The account of his second expedition to Africa is entitled *A Journey to Ashango-Land, and Further Penetration into Equatorial Africa* (Lond. 1867).

CHAMBRE INTROUVABLE (Fr. unfindable chamber; i. e., the chamber the like of which is not to be found again) was the name sarcastically given to that Chamber of Deputies in France which met after the second return of Louis XVIII. (July 1815), and which, by its fanatical royalty, began to throw the country and society anew into commotion. The former chamber, which had shewn much moderation, had been dissolved under the influence of the court party; and the ministry, led by Talleyrand, had done everything to procure for the ruling party at least a manageable chamber adapted for business. The number of the deputies was arbitrarily raised from 259 to 392; and to secure the victory of a complete restoration, all rushed forward who saw in the constitutional charter an encroachment on their privileges and pretensions. When it is considered, in addition, that the elections, at least in the departments of the south, took place under terror and the sanguinary outrages of a populace in a state of political and religious excitement, that the press was stifled, and the people deprived of all freedom of expression by the foreign armies, ultra-royalism could not fail to be completely triumphant. When the ministers saw this startling result, they did not venture to open the session; they resigned, and gave place to the Richelieu ministry. Then broke out the most frightful excesses in the southern provinces. At the elections in Nîmes (22d August), more than 100 persons were killed by the royalist bands. At last, on 7th October, the king opened the chamber, on which he enjoined quietness and moderation; and it appeared as if it did take this advice to heart for an instant. But when, in one of

the first sittings, Boyer d'Argenson asked for the intervention of the chamber in behalf of the Protestants, who were being slaughtered in the south by the ultra-royalist bands, the speaker was called to order, and the chamber from that time ceased to observe any bounds or moderation. The fanatical legislation of this chamber inspired the ministers, the king, and especially the Emperor Alexander, with so much aversion and apprehension, and also met so decidedly with the disapprobation of all peaceful and sincere friends of the throne, that the news of its dissolution, on 5th April 1816, was received with universal rejoicing. The electoral law of 5th February 1817 prevented the return of a similar chamber; and it was not till by the modified electoral law of 1820 that ultra-royalism regained a predominant influence in parliament. It is said that Louis XVIII. first used the epithet *Chambre Introuvable* in an ironical sense, and that the majority of the chamber took it seriously as a compliment.

CHA'NDAH, a town of India, on the south-west frontier of the territory of Nagpore, on the left bank of the river Eraee, near its junction with the Wurda, 90 miles south of the town of Nagpore. Its walls, built of cut stone, and surrounded by a high parapet, are 6 miles round, from 15 to 20 feet high, and flanked with round towers large enough for the heaviest guns. Within the place, and almost equidistant from the north and south faces, is a citadel; the rest of the interior consists of straggling streets, detached houses, and plantations. It is well supplied with water. In 1818, C. was taken by the British.

CHANDHAIREE', or **CHANDERI**, a town of India, in the province of Malwa, in the territory of Gwalior, in a hilly and jungly district, 106 miles south of Gwalior, near the left bank of the Betwa, a tributary of the Jumna. It is at present much decayed, on account of Mahratta oppression, the scourge of war, and the decay of its manufactures, which are undersold by the cheaper fabrics of Britain; but the extent and architectural excellence of its ruins indicate its splendour and importance in former times, when it is said to have contained 14,000 stone houses, 384 markets, 360 caravanserais, and 12,000 mosques. The fort of C., formerly deemed impregnable, consists of a strong rampart of sandstone, flanked by circular towers, and is situated on a high hill. Among other remains of former greatness, is a pass cut through a solid rock 100 feet high. During the native wars, being a place of importance, C. was frequently besieged. Under Mahratta sway, it became a haunt of freebooters, very troublesome to the native districts under British rule or protection; and on the conclusion of the treaty of 1844, it was, among other lands, assigned for the maintenance of the increased Gwalior contingent, commanded by British officers.

CHANDPOO'R, a town of British India, in the North-west Provinces, district of Bijnour, about 930 miles north-west of Calcutta, and 80 north-east of Delhi. It is of considerable size, and has a pop. of 11,491.

CHANK-SHELL, the popular name of the shell of several species of *Turbinella*, a genus of gasteropodous molluscs of the group *Siphonostomata* (q. v.), natives of the East Indian seas. These shells are obtained chiefly on the coasts of the south of India and Ceylon, and form a considerable article of trade to Calcutta. They are much used as ornaments by Hindu women, the arms and legs being encircled with them; and many of them are buried with the bodies of opulent persons. Those which are thrown

up on the beach, after the death of the mollusc, and have become whitened, are little valued, but fresh shells readily find purchasers. The commercial

Chank-shell.

returns shew an exportation of chank-shells from Madras amounting to the number of 2,460,727 in one year, 1853—1854, the value of which was about £10,000. The quantity ordinarily exported is smaller. A chank-shell opening to the right is rare, and is highly prized in Calcutta, so that a price of £50, or even £100, is sometimes paid for one.

CHARLES X., or CHARLES-GUSTAVUS, king of Sweden, was born at Nyköping, 8th November 1622. After studying at the university of Upsala, he travelled through France, Germany, and Switzerland, joined the army of Torstensohn (q. v.) in 1642, fought at the battles of Yankovitz and Leipzig; and at the close of the war was the representative of Queen Christina at the conferences which were held for giving effect to the treaty of Westphalia. On the abdication of Christina, Charles-Gustavus, who was the son of Gustavus Adolphus's eldest sister Catharine, and John Casimir the Palatin of Zweybruck in Clerburg, succeeded as next heir, 17th June 1654, to the throne of a kingdom which, after his accession, he discovered to be in an almost bankrupt condition. There was a debt of 10,000,000, while the revenue did not amount to 800,000 crowns, out of which one-fourth was granted as a pension to the ex-queen, whose carelessness and extravagance had brought about this deplorable state of matters, and who, in the words of the aged chancellor Oxenstierna, 'had cost Sweden dearer than ever an enemy did.' She had taken away everything belonging to the royal residences which was portable; and C. was forced at first to borrow even a set of kitchen utensils. C. was the second of the three great warrior-monarchs of Sweden, but unlike his uncle, who could plead religious grounds, and his grandson, who was at first forced to fight for self-preservation, C. seemed to make war principally for war's sake. First he attacked Poland in July 1655, because the Polish monarchs had not resigned their claim to the Swedish throne; captured in the same year Warsaw, Cracow, Thorn, Elbing, Posen, and Kalicz; and drove the king to take shelter in Silesia: he then assailed the Danes, who had declared war against him, crossed the Belts on the ice, and speedily made himself master of all the continental possessions of Denmark. Next marching from isle to isle over the frozen sea, he ultimately, by menacing Copenhagen, compelled the treaty of Roskild (7th March 1658), which gave to Sweden, Holland, Scania, Bleckingen, Bornholm, and the other Danish possessions beyond the Sound, and emancipated Sweden from the Sound Dues. Charles, however, still cherished enmity against the Danes; and after fruitlessly proposing to the Dutch and English a partition of Denmark, he invaded Zealand, and

attacked Copenhagen in 1659. The capital, however, defended itself valiantly, aided by succour from the Prussians and Dutch; and the Swedish monarch was compelled to abandon the siege. Soon after, while labouring to effect a complete reconciliation with Poland in order to be free to attack the Danes in Norway, he died suddenly at Gothenburg, February 23, 1660.

CHARLES XI., one of the ablest kings of Sweden, was the son of King Charles (X.) Gustavus, and was born November 24, 1655. While he was little more than four years old at his father's death, the government was committed to his mother Hedwig as regent, and a council. The peace of Oliva (May 3, 1660) with Poland, by which Sweden obtained Esthonia, part of Livonia, and Oesel, and the Polish monarch renounced all pretensions to the Swedish crown; and that of Copenhagen (June 8, 1660), generally confirmatory of the treaty of Roskild with Denmark, were the first important acts of the government. A treaty with Russia on the basis of the *status quo* followed in 1661; and from this period till 1672, the kingdom was free from foreign wars. In December 1672, C. (whose education had been so ill attended to that he had reached manhood before he could read) took the reins of government, and by the allurements of France, was induced to make war on Brandenburg. This unprovoked attack was disastrous to the Swedes, for they suffered a severe defeat from the elector at Fehrbellin (1675); and though C. revenged himself by defeating the Danes (who were allied with Prussia) at Halmstadt, Lemd, and Landskrona, his fleet was defeated by the Dutch near Oeland, and again by the Danes at Bleking and Kjöge; and many of Sweden's recent acquisitions were wrested from her. These, however, were restored by the peace of Saint-Germain-en-Laye (17th September 1679), which closed this needless and unfortunate contest. In 1680, a struggle commenced between the crown, supported by the burghers and peasants, on one hand, and the nobles on the other; and a considerable diminution of the power of the nobles was the consequence. The resumption of all the crown lands which had been alienated since 1609, was a fatal blow to the preponderating power of the nobles; and by a voluntary declaration of the states, December 9, 1682, the king was invested with absolute authority. This voluntary erection of a despotism by the people, a thing of rare occurrence in the world's history, is yet more extraordinary at the close of the 17th c.; and it speaks highly for C. that he never employed his unlimited authority otherwise than for the best interests of his kingdom. By a judicious administration of the revenues, he was enabled to extinguish the public debt (1686), reorganise the fleet and army, and by 1693 to dispense with the calling up of extraordinary subsidies. Though absolute, he never imposed a tax but with consent of the states; and he every year published a detailed account of revenue and expenditure. In 1693, he was formally declared absolute by an act of the diet. The foreign policy of the country was also conducted in a manner equally satisfactory and effective. Deux-Ponts fell to him as heir to his cousin Friedrich-Ludwig, the last palatine, in 1681; the attempts of the Danes upon Holstein were rigorously repressed, and many small outlying territories were brought under his sway. His anxiety for his subjects' welfare was particularly shown by commercial and maritime regulations superior to any that then existed in Europe; and by his numerous journeys to all parts of his dominions to examine for himself into the remote details of the administration. A codification of the laws was commenced, but was unfinished

at his death, which took place at Stockholm, 15th April 1697.

OHATSK, or **SCHAZK**, a town of European Russia, government of Tambov, 175 miles south-east of Moscow, on a small river of the same name. It is situated in the midst of a vast fertile plain, contains a number of churches, and has a trade in hardware, grain, and cattle. Pop. 7231.

CHAUVINISME. Chauvin was the name of the principal character in a French comedy, which was played with immense success at the time of the Restoration. He represented a bragging veteran of the empire, who was continually talking of his achievements at Austerlitz and Jena, and his determination to take a brilliant revenge for Waterloo. Since then, a *chauviniste* has come to mean a man who is always seeking quarrels with his neighbours, and will not admit that any one is brave or great but himself.

CHEADLE, a small but neat market-town of England, in the moorland district of the north part of the county of Stafford, 14 miles north-north-east of the town of Stafford, 3 miles from the Froghall station on the Churnet Valley branch of the North Staffordshire Railway, and 4 miles from the Blyth Bridge station on the main line from Derby to Crewe. The town is seated in a pleasant vale, surrounded by hills mostly planted with fir and other trees. The parish church (St Giles) was a very ancient structure, but was rebuilt in 1837—1838. A magnificent Roman Catholic church, erected at the sole expense of John, Earl of Shrewsbury, was opened in 1846. There are several dissenting chapels, various schools, a mechanics' institute, a large tape manufactory, and also one for silk. There are copper and brass works a short distance from the town, and coal and limestone abound in the vicinity. Pop. (1861) 3191.

CHELIFER, a genus of *Arachnida* (q. v.) of the order *Trachearia*, and of the family to which, from their resemblance to scorpions without tails, the name *Pseudo-scorpions*, or False Scorpions, has been given, the true scorpions belonging to the order *Pulmonaria*. The genus *C.* consists of minute species in which this resemblance is very strong. The palpi are elongated and armed with pincers. The species live under the loose bark of trees, in chinks of old furniture, &c. One species, *C. can-croides*, about a line and a half in length, is frequently to be seen in old books, herbaria, &c., and is called the *Book Scorpion*; it is said to be useful as feeding on the insects which are most destructive to books and collections in natural history.

CHELM, a town of Russian Poland, in the government of Lublin, 126 miles south-east of Warsaw. It is the seat of a United Greek bishop, and has a theological seminary. The Poles were defeated here by the Russians, June 4, 1794. Pop. 5640.

CHEMICAL TOYS, which during the last two years have been brought prominently before the public, deserve a brief notice. 'Pharaoh's Serpents,' which have been already described in the article **SULPHOCYANOGEN**, are highly poisonous, and during combustion evolve dangerous vapours. *Larmes du Diable*, or 'Crocodiles' Tears,' are formed of metallic sodium, burn with extreme violence if thrown into water, or even if moistened with water or heated, and scatter particles of caustic alkali, which may inflict serious burns. 'Sunshine in Winter Evenings,' 'Fiery Swords,' &c. are formed of magnesium, and, like the preceding, may cause serious burns. 'Sensation Cigarettes' are charged with gun-cotton, and project, when fired, noxious vapours into the mouth; while pyroxylin, which is

bibulous paper rendered highly explosive by the action of strong nitric and sulphuric acid, and which is identical with gun-cotton, is the active agent in the various toys known as 'Will-o'-the-wisp Paper,' 'Parlour Lightning,' 'Fireflies,' 'Aerial Glow-worms,' 'Chinese Fire-paper,' &c.

The use of these toys in teaching rudimentary chemistry to children and young persons is quite incommensurate with their danger.

CHEMISTRY. It is impossible in this article to do more than briefly describe some of the most important of the numerous changes which have been introduced into the science of chemistry within the last six or eight years (1867).

1. The system of measuring temperatures, lengths, weights, and volumes has been altered. The centigrade has completely superseded the Fahrenheit thermometric scale in all recent chemical works, and the French metric (which is a decimal) system has been adopted for all measurements and weights, inches and their fractions being replaced by 10ths or 100ths of a metre, and grains by grammes. It has this advantage over all other systems, of possessing one fundamental linear unit, from which all the ramifications of linear, superficial, or solid dimensions, and of weight are derived. See **MÈTRE**, **LITRE**, **GRAMME**, **FRANC**. This unit is the 10-millionth part of a quadrant of the meridian, or of the distance from the pole to the equator. It is only to measures of weight and capacity or volume that we need here refer. 'Multiply,' says Dr Hofmann in his energetic appeal in favour of the metric system, 'the cubic metre by one million, and you have a fit measure in terms of which to express the capacity of the Atlantic, or its cubical contents of brine; divide the cubic metre by one million, and you arrive at the petty volume of the gambler's ordinary die.'—*Modern Chemistry*, p. 124. This last-named volume, the millionth of a cubic metre, taken as so much distilled water at a temperature of 4° C. (its point of greatest density), furnishes the metrical unit of weight called the *gramme*, which thus forms a link connecting weight with measure. Again, dividing the edge of a metre cube, which is a linear metre, into 10 parts, called *decimètres*, and cubing one of these parts, we obtain a unit of volume or capacity to which the term *litre* is applied. The various weights in use are all multiples or divisions by tens. Thus, 10 mètres form a decamètre, 100 a hectomètre, and 1000 a kilomètre; while $\frac{1}{10}$ th of a metre is called a *decimètre*, $\frac{1}{100}$ th a centimètre, and $\frac{1}{1000}$ th a millimètre, the Greek prefixes in all cases denoting multiplication, and the Latin division. The reader will do well to recollect the following rough comparisons between the chief French and English measures chiefly used in chemistry, as otherwise he can form no conception of the length, size, or weight of the substances treated of: A metre = nearly 1·1 linear yard = 39·37 inches; a millimètre = 0·039, or nearly $\frac{1}{25}$ th of an inch; a centimètre = 0·39, or nearly $\frac{1}{2}$ ths of an inch; and a decimètre = 3·94, or nearly 4 inches; a gramme = 15·43 grains; and a litre = rather more than 61 cubic inches, or a pint and three-quarters. The accompanying figure represents a cubic decimètre. Two of the edges of the front side are divided, as may be seen, into 10 linear centimètres; and the space occupied by a cubic centimètre is shewn on the upper right-hand corner of the tube. Now, a cubic decimètre is employed as a unit for measures both of weight and of volume, for in the former capacity it contains, at 4° C., 1 kilogramme, or 1000 grammes of distilled water, and in the latter it loses its name of kilogramme and receives the appellation of *litre*, which corresponds

CHEMISTRY.

to 1000 cubic centimètres, or $\frac{1}{1000}$ th of a cubic mètre. Chemists have long felt the want of an appropriate *volume*, with its corresponding weight, to serve as standard units of measurement, and Professor Hofmann has selected 1 cubic decimètre = 1 litre, as the most appropriate unit of volume, and the weight of this measure of pure hydrogen as the unit of weight, hydrogen being taken at 0° C.

temperature, and 0.76* pressure. To this standard *weight-unit*, which = 0.0896 of a gramme, he assigns the name of *crith*, from the Greek *κριθή*, a barley-corn, signifying figuratively a small weight; and the weight is now in universal acceptance amongst modern British chemists. There is probably no figure in chemical science more important than this one (0.0896 of a gramme)

to be remembered and kept ready for calculation; for it is the standard multiple or co-efficient by means of which the weight of 1 litre of any other gas, simple or compound, is computed. For example, the relative volume-weight of chlorine being 35.5, that of oxygen 16, and that of nitrogen 14, the actual weights of 1 litre of each of these elementary gases at 0° C. and 0.76 pressure, may be called respectively 35.5 *criths*, 16 *criths*, and 14 *criths*. So again with reference to the compound gases, the relative volume-weight of each is equal to half the weight of its product-volume. Hydrochloric acid (HCl), for example, consists of 1 volume of hydrogen + 1 volume of chlorine = 2 volumes, or by weight, 1 + 35.5 = 36.5 units; whence it follows that the relative value-weight of hydrochloric acid gas is $\frac{36.5}{2} = 18.25$ units; which last figure therefore ex-

presses the number of *criths* which 1 litre of hydrochloric acid gas weighs at 0° C. and 0.76 pressure, $18.25 \times 0.0896 = 1.6352$ as the actual weight in grammes of hydrochloric acid gas. Again, as the product-volume of water-gas (H₂O),† taken at the above temperature and pressure, contains 2 volumes of hydrogen + 1 volume of oxygen, and therefore weighs 2 + 16 = 18 units, the single volume of water-gas weighs $\frac{18}{2} = 9$ units, or substituting as before the concrete for the abstract value, 1 litre of water-gas weighs 9 *criths*; that is to say, 9×0.0896 gramme

* It is almost unnecessary to notice that 0.76 signifies 0.76 of a mètre, or nearly 30 inches—the ordinary atmospheric pressure at the level of the sea, and at lat. 51½°.

† The reason why the formula H₂O, instead of HO, for water is used, will be presently explained.

= 0.8064 gramme.—*Op. cit.* p. 131. In concluding this subject we will only further remark, that when a closely approximative result suffices, the crith may be estimated at 0.09 gramme.

2. Such terms as *atomic weight*, *atom*, and *molecule* are now employed in a stricter sense than formerly. Every element has been held from the time of Dalton to have a number called its atomic weight. This number, according to Dr Frankland, one of our most distinguished modern chemists, is made to represent, as far as possible: '1st, The smallest proportion by weight in which the element enters into or is expelled from a chemical compound—the smallest weight of hydrogen so entering or leaving a chemical compound being taken as unity. 2d, The weight of the element in the solid condition at any given temperature contains the same amount of heat as seven parts by weight of solid lithium at the same temperature. 3d, The weight of the element which, in the form of gas or vapour, occupies, under like conditions of temperature and pressure, the same volume as one part by weight of hydrogen.'—*Lecture Notes for Chemical Students*, 1866, p. 2. Recent investigations have led chemists to assign to many of the elements double the atomic weights that were previously assigned to them. Thus, taking as formerly the atomic weight of hydrogen as the unit, the atomic weight, or, as it is now often styled, the *atomic number* of oxygen is changed from 8 to 16, that of carbon from 6 to 12, that of sulphur from 16 to 32; and this doubling is by the latest writers extended to most of the elements except the halogens, nitrogen, phosphorus, boron, the metals of the alkalies, gold, and silver. The old atomic weights are still recognised as *combining* or equivalent numbers. The reason why this doubling of the number has been adopted will be presently given. The distinction between an *atom* and a *molecule* must be clearly recognised. 'We may define an *atom* of an elementary body to be the smallest proportional weight thereof which is capable of existing in *chemical combination*; and we may define the *molecule* of an elementary body to be the smallest proportional weight thereof which is capable of existing in the *free or uncombined state*.' This, which is Hofmann's definition (*Modern Chemistry*, p. 157), is now generally accepted. Thus a *molecule* (or *elementary molecule*, as it is often termed) may consist either of an isolated atom, or of a group of atoms.

The bulk of a molecule, or the *molecular volume* of an element in the gaseous or vaporous state, is the same as the molecular volume of hydrogen at the same temperature and pressure, and in a large number of cases the *molecular weight* of an element is twice its atomic weight. Dr Frankland gives the following list of the elements whose molecular volumes have as yet been determined: The molecules of mercury, cadmium, and zinc contain *one atom*, and are termed *monatomic molecules*; those of hydrogen, oxygen, chlorine, bromine, iodine, fluorine, nitrogen, sulphur, and selenium contain *two atoms*, and are termed *diatomic molecules*; the molecules of oxygen, as ozone, contain three atoms, or are *triatomic*; while those of phosphorus and arsenic are *tetratomic*, and those of sulphur under certain conditions are *hexatomic*. Thus an element, as in the cases of oxygen and sulphur, may, under different conditions, have two distinct molecular weights. We shall presently refer more fully to the subject of *atomicity*.

3. We shall now proceed to explain the reasons why many of the atomic weights have been doubled. 'It is obvious,' says Dr Odling, in his elaborate article on 'Atomic Weights' in *Watts's Dictionary of Chemistry*, vol. i. p. 466, 'that the atomic weights

of an element and of its combinations should be selected so as to express the entire series of combinations by the simplest series of formulae; so as best to accord with the chemical properties and metamorphoses of the bodies; so as best to illustrate their analogies with other bodies; and so as to be in relation with their physical properties, such as their specific volumes, specific heats, isomorphism, &c.' We shall endeavour to shew how he applies these views to prove that, in the case of oxygen, 16 parts of that element, or the quantity thereof which unites with 2 atoms of hydrogen, is the smallest proportion of oxygen that can enter into a combination. 'We find, in the first place,' says Dr Odling, 'that the quantity of oxygen contained in the great majority of definite oxidised compounds must necessarily be represented by 16, or some multiple of 16 parts. Thus, the molecules of all hydrates, double oxides, acids, oxisalts, aldehydes, ketones, alcohols, oxacid-ethers, and a great number and variety of other compounds, doubtless forming together 99 per cent. of all known compounds of oxygen, cannot be represented save with 16 parts, or some multiple of 16 parts of oxygen. For example, the molecules of *hydrate of potassium*,* *benzoic aldehyde*, *acetone*, *chloral*, *hypochlorite of sodium*,* &c., each contain 16 parts of oxygen. The molecules of *spinelle*, *brown hematite*, *camphor*, *benzole*, *acetate of sodium*,* *benzoic acid*, &c., each contain twice 16 parts of oxygen. The molecules of *nitric acid*, *glycerin*, *chlorate of potassium*,* *salicylic acid*, *augite*, &c., each contain three times 16 parts of oxygen.' We need not carry the quotation further, it being sufficient to remark that Dr Odling gives similar lists of substances whose molecules each contain 4, 5, 6, 7, &c. times 16 parts of oxygen. Hence it follows that, when two bodies only differ in composition by the different proportions of oxygen which they contain, that difference amounts to 16 parts, or some multiple of 16 parts of oxygen. This is well shewn in the two following series of bodies given by Odling, in the former of which the symbols are arranged according to modern views:

| | | | |
|---------------------|-------------------------|--|-----------------|
| KCl, | Chloride of potassium. | C ₂ H ₄ , | Ethylene. |
| KClO ₂ , | Hypochlorite of potash. | C ₂ H ₂ O ₂ , | Aldehyde. |
| KClO ₃ , | Chlorite of potash. | C ₂ H ₃ O ₂ , | Acetic acid. |
| KClO ₄ , | Chlorate of potash. | C ₂ H ₃ O ₃ , | Glycolic acid. |
| KClO ₅ , | Perchlorate of potash. | C ₂ H ₂ O ₃ , | Glyoxylic acid. |

It is obvious that in both these series each term differs from the preceding one simply by O₂, or 16 parts of oxygen. Again, the quantity of oxygen which can be liberated by any reaction, and which, either alone or in the form of water, can be added to or separated from a compound, must be 16, or some multiple of 16 parts. Thus, each molecule of nitrate of soda (NaO,NO₃), when decomposed by heat, yields nitrite of soda (NaO,NO₂) and O₂ (or 16 parts of oxygen); similarly, each molecule of permanganate of potash, when decomposed by sulphuric acid, yields manganese, alum, and O₂ (or twice 16 parts of oxygen); and each molecule of chlorate of potash (KO,ClO₃) is decomposed by heat into chloride of potassium (KCl) and O₆ (or three times 16 parts of oxygen). Again, water (and consequently its main constituent, oxygen) is always eliminated in double or some higher even atoms. Thus, formic acid (C₂H₂O₂) yields carbonic oxide (C₂O₂) and two atoms of water (H₂O₂); alcohol (C₂H₆O) yields olefiant gas (C₂H₄) and two atoms of water (H₂O₂); oxalate of ammonia (NH₂,C₂H₂O₄) yields cyanogen (C₂N) and four atoms of water (H₂O₂); and innumerable additional examples

* In these cases, one of the new forms of nomenclature is introduced.

might be given. On these grounds (and many additional ones might be adduced if space permitted) it becomes obvious that if the vast majority of oxidised bodies were correctly formulated, they would be represented more simply by the formulae in which $O = 16$ than by formulae in which $O = 8$. Reasons of a similar nature have led to the duplication of the atomic weight of carbon, sulphur, and many of the other elements. There must obviously be some means of distinguishing when O indicates 8 or 16 parts of oxygen, \bar{O} indicates 6 or 12 parts of carbon, &c. Various modes of distinction have been adopted by different chemists. In *Watts's Dictionary of Chemistry*, now in the course of publication, the new atomic weights are represented by the same symbols which have hitherto been adopted for the old weights; while the latter (when they are occasionally introduced) are printed in italic capitals; thus, water is represented by H_2O in the new and by HO in the old system, acetic acid by $C_2H_4O_2$ in the new and by $C_2H_4O_4$ in the old system, &c. A more common means of indicating when the value of the symbol of an element is doubled in value is by drawing a horizontal bar through it, a notation due to Berzelius; thus, \bar{C} , \bar{O} , \bar{S} represent respectively an atom of carbon, of oxygen, and of sulphur in the new system. This system is useful in forming, as it were, a bridge to facilitate the passage from the old to the new system, and will gradually disappear when all chemists recognise the doubled atomic weights. Naquet, Miller, (in the 3d edition of his *Chemistry*, 1864), and others, adopt this barred system, and the latter frequently gives the formulae pertaining to both systems; for example, $FeO, SO_2, HO, 6HO$, or $Fe\bar{O}, H_2\bar{O}, 6H_2\bar{O}$, represents the composition of the crystallised sulphate of protoxide of iron often described as protosulphate of iron.—*Inorganic Chemistry*, 3d ed., p. 6. Some writers, as Frankland, in his *Lecture Notes for Chemical Students*, 1866, following the plan of Watts and the contributors to his Dictionary, unreservedly adopt the doubled atomic weights, and represent them by the old formulae; thus, O , C , and S represent in these works precisely double the weight of oxygen, carbon, and sulphur that these capitals represent in the 1st and 2d editions of Miller's *Chemistry*, Fownes's *Manual of Chemistry*, and other standard works published a few years ago. It is now customary for the writers of chemical papers who object to the barred symbols as being unseemly, to insert at the commencement $\bar{C} = 6$, $\bar{O} = 8$, or $\bar{C} = 12$, $\bar{O} = 16$, in order that the reader may be able to recognise which system is adopted.

Chemical Nomenclature is still in an unsettled state. The chemists of all countries are, with one notable exception, agreed as to the names and symbols which should represent the different elements. The French chemists persist in designating nitrogen by the name of *azote*, and of using Az instead of N for its symbol; and in Italy the term *azoto* is still employed, but as it is often coupled with the symbol N , it will probably soon be exchanged for the more general term nitrogen. When the elementary bodies unite together, they form a *binary compound*. The nomenclature of the binary compounds is in a transitional state. The compounds of sulphur with metals used to form *sulphurets*, latterly they have been termed *sulphides*, and now they are denominated after a third fashion; sulphuret of potassium (for example), after having been for some years sulphide of potassium, now being termed *potassic sulphide*. In order to obtain uniformity, the following rule is adopted by the representatives of the modern school. The names of binary compounds are formed from those of their constituents, the English or

Latin name of the positive constituent with the terminal *ic* preceding that of the negative constituent, which is made to end in *ide*. Thus: potassium and sulphur form *potassic sulphide*; sodium and oxygen form *sodic oxide* (formerly *soda* or *oxide of sodium*); silver and chlorine form *argentic chloride* (formerly *chloride of silver*); lead and iodide form *plumbic iodide* (formerly *iodide of lead*); calcium and chlorine form *calcic chloride* (formerly *chloride of calcium*), &c. When the same elements form two compounds, the one which contains the smallest proportion of the negative element is distinguished by changing the terminal syllable of the name of its positive constituent into *ous*, while the terminal *ic* is retained for the compound containing the larger proportion of the negative element. Thus, 1 atom of iron and 1 atom of oxygen form *Ferrous oxide* (the old protoxide of iron); 2 atoms of iron and 3 atoms of oxygen form *Ferric oxide* (the old peroxide of iron). Sometimes the same elements form more than two compounds with one another, and then the prefixes *hypo* and *per* are employed. When a binary compound contains oxygen, and becomes an acid when made to unite with water, or becomes a salt when united to a base, it is termed an *Anhydride* (q. v.) or *anhydrous acid*. Thus 1 atom of carbon and 2 atoms of oxygen form *carbonic anhydride*, formerly known as *carbonic acid gas*; 1 atom of sulphur and 3 atoms of oxygen form *sulphuric anhydride*, &c. In a considerable number of cases, the trivial or common name has not been displaced by the new systematic name; thus water, ammonia, hydrochloric acid, phosphuretted hydrogen, sulphuretted hydrogen, &c., are not as yet replaced by hydric oxide, hydric nitride, hydric chloride, hydric phosphide, hydric sulphide, &c.; and soda and potash are still preferred by some chemists to sodic and potassic hydrates.

The term *acid* was originally applied only to substances which, like vinegar, possessed an acid taste; it is now made to include a large number of compounds which do not possess this property. The most general definition of acids is that of Gerhardt, which is adopted in *Watts's Dictionary of Chemistry*—namely, that 'acids are salts of hydrogen.' A more intelligible definition to ordinary readers is that which is adopted by Frankland, in which an acid is described 'as a compound containing one or more atoms of hydrogen, which become displaced by a metal when the latter is presented to the compound in the form of a hydrate.' Thus, using the new nomenclature and atomic weights, nitric acid and sodic hydrate yield sodic nitrate and water—

in which reaction the hydrogen of the nitric acid is displaced by the sodium of the sodic hydrate (or soda), and as only one atom of hydrogen is displaced, nitric acid is said to be *monobasic*. When an acid admits of the displacement of two atoms of hydrogen, it is termed *di-basic*—as tartaric, oxalic, and, according to recent views, sulphuric acid; and when three atoms can be replaced—as in the case of common phosphoric acid, H_3PO_4 , in which H_3 may be displaced by K_3 or Ag_3 , the acid is termed *tribasic*. The nomenclature of the compounds of acids with bases is still unfixed. The names of the alkali-metals (potassium, sodium, and lithium) and alkali-earth metals (barium, calcium, &c.) are now commonly substituted for those of their oxides in the nomenclature of the corresponding oxygen salts—as, for example, *carbonate of sodium* and *sulphate of calcium* for carbonate of soda and sulphate of lime. The names of these bodies are

thus brought into uniformity with those of the salts of iron, copper, &c. In *Watts's Dictionary* and *Frankland's Lecture Notes* such compounds are denominated *sodic carbonate, calcic sulphate, sodic nitrate, &c.*; and these terms will doubtless soon be generally adopted for the metallic salts of the oxygen-acids generally. The nomenclature of complex inorganic bodies is founded, for the most part, on the theory of types, the names of particular compounds being obtained from the name of the type by prefixing to it adjectives which express the nature of the element by which the hydrogen of the type is replaced and the number of atoms of it contained in one molecule of the compound. By way of illustration, we give a simple and a complicated example :

tetramercuro-tetrahydric dioxi-dichloro-dinitride. The nomenclature of organic compounds is founded on the same principles as that of inorganic bodies; but our limited space prevents our entering into this subject.

Chemical Notation has been considerably altered by certain members of the recent chemical school; but on the whole, the modifications, since the time when the system of Berzelius was introduced into England in the third edition of *Turner's Elements of Chemistry*, are not numerous. The most important are the introduction of 'general formulae' by Gerhardt, in which letters of variable value are used as coefficients instead of numbers, and Odling's method of denoting the atomicity of polyatomic elements and radicals by means of accents placed above the symbols, which are then called dashed symbols. See TRIADS. Chemists are still at variance as to whether, when two or more atoms are represented in a compound, the figure indicating the repetition should be above or below the symbol; whether, for example, water should be represented by H^2O or H_2O , and alcohol by $\text{C}^2\text{H}^4\text{O}$ or $\text{C}_2\text{H}_4\text{O}$. The ordinary

or *dualistic* system, according to which the elements combine in couples to form compounds, which similarly unite by twos, led to the division of salts into two classes—viz., into salts composed of an oxygen acid and an oxygen base, which were hence called oxygen salts, as NaO, SO_2 , and KO, NO_2 , which in the old notation represent sulphate of soda and nitrate of potash; and binary or haloid salts, of which chloride of sodium, NaCl , is the type, which are formed by the union of the radical in hydrogen acids with some metal. Davy considered that the former class might be made similar to the latter by regarding them as composed of a metal and a compound radical having the same electro-negative chemical relations as the radicals in the hydrogen acids. According to this view, a radical, SO_2 , not yet isolated, combines with hydrogen to form sulphuric acid, and with a metal to form sulphates, sulphuric acid being represented by H_2SO_4 , and sulphate of lime by CaSO_4 . In like manner, nitric acid and the nitrates were supposed to contain a radical, NO_2 . Against this view Gerhardt urges that we know nothing of the proximate constitution, but are merely acquainted with the ultimate composition of compounds. Hence we now no longer use a formula for sulphuric acid indicating its supposed constitution (HO, SO_2), but regarding it as a dibasic acid, express it, either as Miller does, by $\text{H}_2\text{S}\text{O}_4$, or by H_2SO_4 (where S = 32 and O = 16), or by $\text{SO}_2 \left\{ \begin{array}{l} \text{O}_2 \\ \text{H}_2 \end{array} \right\}$, if we adopt the type-notation; and we must not omit that Frankland, who may be regarded as the leading representative of the English school of modern chemistry, represents it by the formula SO_2Ho_2 , when Ho is the abbreviated formula for HO, and represents a compound radical, to which he gives the name of hydroxyle, and which is commonly known as binoxide of hydrogen, being expressed, according to the old system, by HO_2 . The following examples may enable the reader to pass from one system to another :

| | Old System. | Barred System. | New Atomic Weights. | Frankland's Notation. |
|------------------------------|---------------------------------------|--------------------------------------|--------------------------------------|--|
| Sulphate of potassium, . . . | K_2SO_4 | K_2SO_4 | K_2SO_4 | SO_2Ko . |
| Sulphate of zinc, . . . | $\text{ZnO}, \text{SO}_2, 7\text{HO}$ | $\text{ZnSO}_4, 7\text{H}_2\text{O}$ | $\text{ZnSO}_4, 7\text{H}_2\text{O}$ | $\text{SO Ho}_2\text{Zno}^{\cdot\cdot} . 8\text{OH}$. |
| Nitric acid, . . . | HO, NO_2 | HNO_2 | HNO_2 | NO_2Ha . |
| Nitrate of sodium, . . . | NaO, NO_2 | NaNO_2 | NaNO_2 | NO_2Naoo . |

The Ko , Zno^{\cdot} , and Naoo in Frankland's notation represent compound radicals, to which he has given the names potassoxyl, zincoxyl, and sodoxyl, and which are represented in the ordinary new notation by KO , ZnO , and NaO . These new names will probably soon get into general use in consequence of Frankland's great influence as the teacher of chemistry in the government School of Mines, and at the Royal Institution.* We must refer to the article TRIADS for a description of what is meant by *atomicity*, or, as Hofmann terms it, *quantivalence*, and the reader will do well to study Lectures 10 and 11 of his *Modern Chemistry*. In the article just mentioned, we have stated that the degree of atomicity of an element is indicated by the number of dashes with which it is furnished. In the so-called *Graphic Notation*, which,

in the hands of Kekulé, Crum Brown, Naquet, Frankland, and others, has proved a most valuable aid in explanation of the constitution of chemical compounds, the degree of atomicity of an atom is thus expressed: H' by H , Zn'' by Zn , B''' (boron) by B , C^v by C , N^v by N , and S⁴ by S . 'No element,' says Frankland, 'either alone or in combination, can exist with any of its bonds disconnected; hence the molecules of all elements with an odd number of bonds are generally diatomic, and always polyatomic—i. e., they contain two or more atoms of the element united together. Thus :

* Another peculiarity of Frankland's notation is the introduction of thick letters (Egyptian capitals). His formulae are so written as to denote that the element represented by the first symbol of a formula, and printed in this type, is directly united by points of attachment or *bonds* with the other elements or compound radicals following the first symbol. Thus, to use his own illustration and notation, the formula SO_2H_2 (sulphuric acid) signifies that the hexad atom of sulphur is combined with the four bonds of the two atoms of oxygen, and also with the two bonds of the two atoms of hydroxyl. (By hexad we mean an atom with six bonds, one of which is subsequently figured in the text.)

| | Symbolic. | Graphic. |
|-------------|---------------|--|
| Hydrogen, | H_2 | $\text{H} \text{---} \text{H}$ |
| Chlorine, | Cl_2 | $\text{Cl} \text{---} \text{Cl}$ |
| Nitrogen, | N_2 | $\text{N} \text{---} \text{N}$ |
| Phosphorus, | P_4 | $\text{P} \text{---} \text{P} \text{---} \text{P} \text{---} \text{P}$ |

An element with an even number of bonds can exist

as a monatomic molecule, its own bonds satisfying each other. Thus :

| | Symbols. | Graphia. |
|----------|----------|----------|
| Mercury, | Hg' | |
| Zinc, | Zn'' | |

This graphic notation is most useful in fixing upon the mind the true meaning of symbolic formulae, and in elucidating the internal arrangement of the very complex molecules which often occur in both mineral and organic compounds. It also affords an easy means of shewing the causes of isomerism in organic bodies. The following example will suffice to illustrate our meaning. The simplest of the alcohol family, methylic alcohol, is derived from marsh-gas by the substitution of one atom of Frankland's hydroxyl, Ho or HO (O = 16), for one of hydrogen.

The Classification of Organic Compounds has, during the last few years, been much improved. Until a comparatively few years ago, organic compounds were arranged, according to their most obvious properties, into acids, bases, fatty bodies, &c. Now the great majority of these compounds are arranged in series, of which each group differs from the preceding one by a fixed additional number of certain atoms. Thus (see Miller's *Organic Chemistry*, 3d ed. p. 34) eleven alcohols are represented by the general formula C_nH_{2n+2}O (new notation), the first being represented by CH₃O, and the others differing from it by an additional number of multiples of CH₂. Bodies of analogous properties thus united are termed *homologous*. Again, every compound in a homologous series yields other compounds differing in composition from that from which they are derived, but yet bearing a different relation to it. Thus, alcohol yields ether, aldehyde, and acetic acid, and these so-called *heterologous* bodies form collateral series. This mode of classification is daily extending. It includes the *organic radicals*, such as methyl, ethyl, allyl, phenyl, cyanogen, &c.; the *hydrides of the compound radicals*, such as methylic hydride or marsh-gas, benzol, cyanic hydride or hydrocyanic acid, &c.; the *alcohols*, which form one of the most important of the families of organic compounds, and which are considered in a special article in this SUPPLEMENT; the *aldehydes* and *ethers*, both of which are specially described; the *acids*, of which the monobasic acids alone include six series, amongst which are the acetic or fatty series, represented by the general formula C_nH_{2n+2}O₂, and containing 19 or 20 distinct acids, the oleic series, the lactic series, the benzoic or aromatic series, &c.—while the dibasic acids may be divided into four series, in which occur the succinic series, containing nine acids, most of which present several modifications, and the tartaric series; the *Anhydrides* (q. v.), of which those belonging to the acetic acid group may be arranged in series; the *ketones* or *acetones*; the compounds of nitrogen containing the *amines*, *amides*, *imides*, &c.; and, in short, excepting the natural alkaloids, the protein-compounds and their derivatives, the uric acid group, pigments, &c., there are few organic com-

pounds which will not soon find a definite place in a series.

In this article we have strictly confined our remarks to the subjects bearing on general, and for the most part on theoretical chemistry. We may, however, allude, in conclusion, to two subjects which have undergone a great development during the last few years—viz., *Volumetric Analysis* and the *Synthesis of Organic Bodies*, both of which are discussed in special articles.

The general tenor of this article shews that chemistry is at present in altogether a transitional state. As Professor Anderson of Glasgow observes in his recent address to the Chemical Section of the British Association (September 1867), the atomic theory, which, at the commencement of the present century, sufficed to explain all the facts of chemistry that were then known, is now quite inadequate to that end. At that time, chemists were acquainted with comparatively few compounds, and in these, oxygen was of such preponderating importance, that the science might have been almost termed 'the chemistry of oxygen.' Oxygen is now deposed from its high place, and is supplanted by carbon to such a degree, that one of the first living chemists has actually proposed for organic chemistry the name of 'the science of the carbon-compounds.' Facts gradually accumulated in the course of time which did not admit of explanation on the Daltonian theory; and as their number increased, such terms as catalysis, allotropy, &c., were invented, under which such facts were grouped together as were supposed to depend on similar causes. Such grouping may have certain temporary advantages, provided it is distinctly understood that, to use Professor Anderson's words, it is 'the grouping of ignorance.' It was not, he adds, till the introduction of the theory of atomicity (see TRIADS), which shews itself in every chemical fact, that the doubts of all thoughtful chemists began to find distinct expression. The time has come when we must either totally abandon the atomic theory of Dalton, or must so completely modify it as to render it substantially a new theory. Most chemists are as yet reluctant to abandon a theory which has converted a crude mass of isolated facts into a comparatively perfect science; whilst a few, whose claims to our confidence are, however, of the highest order, hold with Sir Benjamin Brodie, that the atomic theory can no longer be advantageously used to elucidate chemistry as it now exists, and that the time is come for the adoption of some other system of symbolic expression or notation than the graphic and other formulae which have recently been introduced into our text-books and lectures. In his *Calculus of Chemical Operations*, which was published in the *Philosophical Transactions* for 1866, and in his recent discourse *On Ideal Chemistry*, read before the Chemical Society on June 6, 1867 (and minutely reported* in the *Chemical News* for June 14, and the *Laboratory* for June 15), Brodie has made a systematic attempt to express the composition of chemical compounds by a method in which the idea of an atom has no place. In his system, the exact facts of chemistry are to be expressed by symbols, a *symbol* being a rigid expression of a fact, not a figure of an object, and not of necessity having an arithmetical meaning. 'Symbols,' he observes, 'are of two kinds. We may have symbols of things, and we may have symbols of operations. Symbols of operations are simply symbols of what we do to things. Take

* It is mainly from these reports that we have endeavoured to give the following abstract of Sir Benjamin Brodie's views.

a popular case. Ordinary language is an imperfect symbolic system, and here we have just these two kinds of symbols. A "dog" is the symbol of a thing; and "beating," "caning," "coaxing," and so on, are the symbols of operations, or of something which we may do to a dog. We have marks by which we express things, and marks by which we may express what we do to things. We might also have a third kind of symbol; we might have the symbol of an operation and a thing together. Thus, if we did not wish to represent particularly what sort of animal we were going to beat, we might have a single mark for "beating an animal;" the thing and the operation being included in one.'

In the fundamental conception of his ideal chemistry, all chemical substances are supposed to be brought into the condition of perfect gases. Of course, we may deal with the properties of the combinations of solids and liquids, but here it is far more difficult for us to arrive at any intelligible and simple results; and, whether rightly or wrongly, before beginning to think about the nature of a chemical substance, I, for my part, always conceive it as brought into the condition of a gas. And to go a little further, and to speak a little more definitely, we shall always consider the chemical substance brought into the condition of a gas at the temperature of 0° C., and at a pressure of 760 millimètres. This is the sort of ideal chemical world with which we have to deal. It is a world of gases.'

The two units employed in his system are the unit of matter and the unit of space. The former is thus defined: *The unit of ponderable matter is that portion of ponderable matter which, at a temperature of 0° C., and at a pressure of 760 millimètres of mercury, occupies a space of 1000 centimètres.*

From considering the unit of matter, he passes to the consideration of the unit of space, which is, *the volume of 1000 cubic centimètres.* 'And,' he observes, 'just as, before we begin to think about chemical substances, we must bring them all, theoretically, to the state of gas, so, before beginning to think about the unit of chemical substances, we must begin by thinking about a unit of space. This is the fundamental conception of this method; and it is a notion which appears to me to be almost essential to any constructive chemistry at all—that is, the conception of the unit of space; let us therefore clearly understand what the unit of space means.' [The lecturer here exhibited a hollow cube, with glass walls, and of the dimensions above assigned to the unit of space.] 'You have to do something else, however, before you get the unit of space. It is indeed the space of 1000 cubic centimètres which is confined within these glass walls; but before you can get at the unit of space, you have to go a step further, and by the process of imagination, or by the efforts of reason, you have to divest this cube of glass weight, and take out of it all the ponderable matter which it contains, and conceive the space within the walls divested of matter altogether. Now, this unit of space is so fundamentally important to us, that I shall begin by giving it a mark to itself. The mark which I give to that unit of space is the symbol l . When you see that mark, it is to recall to your mind the matter contained in the unit of space. Now, what is that matter? It is simply no matter at all; there is no ponderable matter in it.'

The next point is to connect the units of space with those of matter. How are we to conceive a space becoming matter, or of matter getting, chemically, into space? This is effected by the aid of an operation, by which the empty unit of space is

turned into a unit of ponderable matter. The symbol x is used to represent this operation. xl , then, represents the operation of putting matter of a certain density into the unit of space, at 0° C. and 760 mm. The same kind of matter, at double the density, and contained within the same space, but still under the same conditions of temperature and pressure, would be represented by xxl , or x^2l ; of three times the density, by $xxxl$, or x^3l . Again, another kind of matter might be represented by y ; then yl , y^2l , and y^3l , would signify the unit of space filled with matter of y under its ordinary density, or double or three times this density, but always under the same conditions of temperature and pressure. These symbols might be combined thus, xy would mean the unit of space filled with x and y at the same time, but under the normal conditions. The symbols then represent weights and kinds of matter: x and y may be said to be operations of combination. Let A be the matter of x , and B the matter of y , then x would mean the operation of combining A , and y would mean the operation of combining B . xl then would mean 'combine A with the unit of space,' and xy would represent 'combine A with B in the unit of space.'

By this mode of constructing symbols, we may represent such facts as the following:

2 vols. of hydrochloric acid contain the same ponderable matter as 1 vol. of hydrogen and 1 vol. of chlorine;

Or, 2 vols. of water contain the same ponderable matter as 2 vols. of hydrogen and 1 vol. of oxygen.

Or, to express a similar fact in the language of the calculus—

2 units of space of ammonia contain the same ponderable matter as 3 units of hydrogen and 1 unit of nitrogen.

In order to be able to construct a definite system of chemical symbols, we must start with an hypothesis of some kind, or must have some one known symbol. The hypothesis, in this system, is, that the unit of hydrogen is a simple weight whose symbol is expressed by a prime factor e ,* which is termed the *modulus* of the symbolic system. The symbols in the subsequent tables, as indicating chemical operations, must be regarded as symbols of primary operations, or operations which cannot be resolved or decomposed into any other symbols. 'When I say,' observes Brodie, 'that the symbol of hydrogen can be expressed in chemical equations by one letter, I mean, that in the changes and transformations of chemistry, that unit of hydrogen is never broken up or decomposed into parts. It is constructed at once, by one operation. Let us now take a more complex substance, oxygen; it is not easy to conceive of its unit being made up by less than two operations.' As an illustration, he suggests that if each combination, as it occurred, was indicated by a vocal sound, we should have one note when hydrogen, and two notes when oxygen, was formed. Hence, the symbol of oxygen,† which is f^2 , must indicate that it is formed by two operations.

* The term *prime factors* is applied by Brodie to the symbols of simple weights, from their analogy to the prime factors of numbers. The subject is discussed in Section V. of his memoir on *The Calculus of Chemical Operations*. The reader will readily see the reasons why ξ , x , v , ϕ , and π are selected as the prime factors of oxygen, chlorine, nitrogen, phosphorus, and carbon; δ and θ represent mercury and sulphur respectively, as being the initial consonants of the Greek words *ιδράργυρος* and *θίον*.

† The mode by which such symbols as F for oxygen, $a\ddot{t}$ for water, $a\dot{x}$ for hydrochloric acid, and a_2^2 for chlorine, are arrived at, may be explained as follows:

Water is represented by $\alpha\xi$; it is made by two operations, one of which is identical with the operation by which hydrogen was made, and the other with one of the operations by which oxygen was made. Hydric peroxide is made by three operations, one of which was identical with that by which hydrogen was made, and the other two with those by which oxygen was made. It is therefore represented by $\alpha\xi^2$. Chlorine, $\alpha\chi$, is made by three operations; hydrochloric acid, $\alpha\chi^2$, is made by two operations, one of which was the same as that of hydrogen, and the other, one of the three operations by which chlorine was made. Nitrogen, $\alpha\tau$, is made by three operations; ammonia, $\alpha\tau^2$, by three operations. These symbols, in fact, are condensed equations, uncombined with extraneous matter.

We are thus led to the singular result, that there are at least three classes of elements, represented by three kinds of symbols:

Those of the first class are elemental bodies, the units of which are made by one indivisible operation, and include hydrogen, α , and mercury, β , probably also zinc, tin, and cadmium.

Those of the second class are double elements, and are made by two operations, as oxygen, ξ^2 ; sulphur, θ^2 , selenium, λ^2 , and perhaps carbon, but as this last is not certain, the element is represented by α .

The third and largest class contain the elements made by three operations; chlorine, $\alpha\chi$, and nitrogen, $\alpha\tau$, may be taken as its representatives. There are many compounds, as, for example, peroxide of hydrogen, $\alpha\xi^2$, which are analogous to the members of this group both in their properties and their symbols.

The following tables shew at a glance how a considerable number of the common chemical elements and their compounds are expressed according to this system, the first containing symbols of hydrogen, oxygen, sulphur, and chlorine, and their compounds, with iodine and bromine; the second containing symbols of the combinations of carbon, hydrogen, and two or three other elements; and the third containing symbols of compounds of nitrogen, hydrogen, oxygen, phosphorus, and chlorine:

| I. | | II. | | III. | |
|--------------------------------------|---------------------|------------------------------------|----------------------|--|-----------------------|
| Unit of space, | 1 | Carbon, | α^3 | Nitrogen, | $\alpha\tau^2$ |
| Hydrogen, | α | Acetylene, | $\alpha^2\beta$ | Ammonia, | $\alpha\tau^2$ |
| Oxygen, | ξ^2 | Marsh Gas, | $\alpha^2\theta$ | Protoxide of Nitrogen, | $\alpha\tau\xi$ |
| Water, | $\alpha\xi$ | Olefiant Gas, | $\alpha^2\theta^2$ | Nitrous Acid, | $\alpha\tau\xi$ |
| Peroxide of Hydrogen, | $\alpha\xi^2$ | Carbonic Oxide, | $\alpha\xi$ | Nitric Acid, | $\alpha\tau\xi^2$ |
| Sulphur, | θ^2 | Carbonic Acid, | $\alpha\xi^2$ | Phosphorus, | $\alpha\theta^2$ |
| Protosulphide of Hydrogen, | $\alpha\theta$ | Alcohol, | $\alpha^2\xi^2$ | Phosphide of Hydrogen, | $\alpha\theta$ |
| Bisulphide of Hydrogen, | $\alpha\theta^2$ | Ether, | $\alpha^2\xi^2$ | Hypophosphorous Acid, | $\alpha\theta^2\xi$ |
| Sulphurous Anhydride, | $\theta\xi^2$ | Glycol, | $\alpha^2\xi^2\xi^2$ | Orthophosphoric Acid, | $\alpha\theta^2\xi^2$ |
| Sulphuric Anhydride, | $\theta\xi^3$ | Glycerine, | $\alpha^2\xi^2\xi^3$ | Tetrachloride of Phosphorus, | $\alpha\theta^2\xi^2$ |
| Sulphurous Acid, | $\alpha\theta\xi^2$ | Anhydrous Acetic Acid, | $\alpha^2\xi^2$ | Pentachloride of Phosphorus, | $\alpha\theta^2\xi^3$ |
| Sulphuric Acid, | $\alpha\theta\xi^3$ | Tetrachloride of Carbon, | $\alpha^2\xi^2\xi^2$ | | |
| Chlorine, | $\alpha\chi$ | Chloroform, | $\alpha^2\xi^2\xi$ | | |
| Hydrochloric Acid, | $\alpha\chi^2$ | Chloroacetic Acid, | $\alpha^2\xi^2\xi^2$ | | |
| Hypochlorous Acid, | $\alpha\chi\xi$ | Trichloroacetic Acid, | $\alpha^2\xi^2\xi^3$ | | |
| Chlorous Acid, | $\alpha\chi\xi^2$ | Cyanogen, | $\alpha^2\xi^2$ | | |
| Chlorosulphurous Acid, | $\alpha\chi^2\xi$ | Hydrocyanic Acid, | $\alpha^2\xi$ | | |
| Hypochlorosulphurous Acid, | $\alpha\chi^2\xi^2$ | Methylamine, | $\alpha^2\xi$ | | |
| Chlorosulphuric Acid, | $\alpha\chi^2\xi^3$ | Mercuric Ethide, | $\alpha^2\beta^2$ | | |
| Iodine, | $\alpha\iota$ | | | | |
| Bromine, | $\alpha\beta$ | | | | |

The question naturally arises, What is the meaning of these symbols? Are they the symbols of portions of matter, or do they merely represent imaginary relations between portions of hypothetical matter? The answer is, that they are ideal. They represent matters and operations which may exist or not. Thus, the compound nature of some of the elements, which is indicated by their symbols, is at present quite hypothetical, but these bodies might prove to be compound. Large numbers of the elements are

unknown in the free state in nature—for instance, hydrogen, chlorine, and, above all, fluorine; so that there may still be simpler forms of matter than those at present known, and they may have all existed in the separate and gaseous condition at one time, and gradually combined to form the substances at present known on the surface of the globe. The spectra of the nebulae and variable stars have disclosed some curious facts; some of them exhibit only portions of the spectra of well-known

It is known by experiment that 2 units of water can be decomposed into 2 units of hydrogen and 1 unit of oxygen. Now, let

- $\alpha^m\xi^{2n}$ = symbol of the unit of water,
- α^m = symbol of the unit of hydrogen,
- $\alpha^n\xi$ = symbol of the unit of oxygen,

where α and ξ are the symbols of simple weights, and m, m_1, n, n_1 , positive integers. Then, expressing the chemical fact symbolically, we have the equation, $2\alpha^m\xi^{2n} = 2\alpha + \alpha^n\xi^2$, and to this are attached the conditions that $w(\alpha) = 1$, and $m + m_1w(\xi) = 9$, where $w(\alpha)$ signifies the weight of a unit of hydrogen. Now, Brodie, in the 4th section of his memoir, shews that the weight (or matter) of which xy is the symbol is identical with the weight (or matter) of which $x + y$ is the symbol; and hence he lays down the anomalous-looking equation, $xy = x + y$, which is termed the *fundamental equation* of the calculus. Now, in the case under consideration, the fundamental equation (which the reader will not thoroughly understand without consulting the original memoir) gives the following result: $(\alpha^m\xi^{2n})^2 = \alpha^{2m}\xi^{4n}$, whence $2m = 2 + n$, and $2m_1 = n_1$. Selecting from the possible solutions of

these equations the minimum solution that is necessary and sufficient to satisfy the conditions, we have

$$m = 1, n = 0, \\ m_1 = 1, n_1 = 2,$$

which give symbol of water, $\alpha\xi$, and symbol of oxygen, ξ^2 ; while the relative weights corresponding to the prime factors α and ξ are $w(\alpha) = 1$, and $w(\xi) = 9$.

In the case of chlorine, it is known that two volumes of hydrochloric acid can be decomposed into one volume of hydrogen and into one volume of chlorine. Hence, putting $\alpha^m\xi^{2n}$ as the symbol of the unit of hydrochloric acid, and $\alpha^n\xi$ as the symbol of the unit of chlorine, we have $2\alpha^m\xi^{2n} = \alpha + \alpha^n\xi$, and, by the fundamental equation, $(\alpha^m\xi^{2n})^2 = \alpha^{2m}\xi^{4n}$, whence $2m = 1 + n$, and $2m_1 = n_1$, the minimum values of which are

$$m = 1, m_1 = 1, \\ n = 1, n_1 = 2.$$

Since the density of hydrochloric acid is 18.25, we find the absolute weight of χ by the equation, $m + m_1w(\chi) = 18.25$, or $w(\chi) = 17.25$, and substituting the former values of m, m_1, n, n_1 , the symbols of hydrochloric acid and chlorine are $\alpha\chi$ and $\alpha\chi^2$ respectively.

elements. May these not be the spectra of some of the components of those matters which we, in the present state of our knowledge, regard as simple bodies? May they not, in fact, be some of those prime factors which have been represented by the symbols χ , ν , ξ &c. Another system of symbols might have been constructed in which the unit of hydrogen would be represented by α , and the formulæ would then have held a simpler relation to the existing system of chemical symbolism, but there are strong reasons for preferring the use of the system in which α is employed to represent the standard amount of matter.

We have endeavoured, in as brief a space as was compatible with clearness, to lay this very complex subject before our readers. Many objections will doubtless be brought against any system that would almost entirely uproot all our recognised opinions; but when we find Sir Benjamin Brodie's views received with approbation by the most eminent physicists and chemists of the day (as may be seen by the speeches of Clerk Maxwell, Stokes, Williamson, Odling, &c., at the close of the delivery of the lecture, and by the numerous articles the subject has called forth in the scientific journals), we do not think that we should be doing justice to our readers if we had not introduced them into this article.

CHERUBINI, LUIGI-CARLO-ZENORIO-SALVATORE-MARIA, an eminent musical composer, was born at Florence in 1760, and received his early musical training there under the Felici (father and son), P. Bizzari, and C. Castrucci. He afterwards studied for a year at Bologna under Sarti, to whom he owed his thorough knowledge of counterpoint and fugue. He visited London in 1784, where he brought out two operas, *La Finta Principessa* and *Giulio Sabino*, and afterwards settled in Paris for the remainder of his life, paying occasional visits to Italy. His *Ifigenia in Aulide* appeared in 1788; and in 1791 his *Lodotica*, which work first secured proper appreciation for his genius, and effected a change in the whole character of the French school of composition. These operas were followed in succession by *Elisa*, *Medea*, *Les Deux Journées* (also known as *Die Wasserträger*), *Anacreon*, and *L'Hôtellerie Portugaise*. His latest opera, *Ali Baba*, was produced, after a long interval, in 1833. Besides operas, C. wrote numerous masses, motets, and other sacred compositions of so great merit, that Beethoven regarded him as the greatest living master of sacred music; also quartets for the violin, viola, and violoncello, and symphonies. His latest work, *Cours de Contrepoint et de Fugue*, appeared in 1835. C. died at Paris in 1842, and his *Requiem*, the last of his masses, was performed at his funeral service.

CHICOPEE, formerly **CABOTSVILLE**, and including Chicopee Falls, a manufacturing town of Massachusetts, U. S., on the left bank of Connecticut River, at the mouth of Chicopee River, 5½ miles north of Springfield. Chicopee Falls supplies water-power to numerous cotton and woollen factories, paper-mills, brass cannon and bell foundries, and the Ames Sword Factory, the largest in the United States. It has 10 churches and several newspapers. Pop. 1866, 7261.

CHIFF-CHAFF (*Sylvia hippolais*), a small species of warbler, very widely diffused, being found both in England and in the neighbourhood of Calcutta. It is common in the south of Europe, is in Britain a summer bird of passage, arriving, however, very early in spring, and does not extend northward into Scotland. Its general colour is brown;

the under parts lighter. It is a very sprightly little bird; but its song consists merely of a frequent

Chiff-chaff (*Sylvia hippolais*).

repetition of two notes resembling the syllables which form its name.

CHILICOTHE, or **CHILICOTHE**, a city of Ohio, U. S., beautifully situated on the right bank of the Scioto River, 45 miles from its confluence with the Ohio, and the same distance south of Columbus, on the Cincinnati and Marietta Railway, and Ohio and Erie Canal; has 13 churches, 3 banks, court-house, foundries, steam-engine and agricultural implement factories, &c. Founded in 1796, and former capital of the state. Pop. (1860) 7626.

CHINANDEGA, a town of Central America, Nicaragua, stands in a fertile plain at the foot of some mountains, about 18 miles north-west of Leon, and about 10 miles from the Pacific coast. The houses are straggling, of one story, built of adobe, and many of them are enclosed by gardens and plantations. Maize, sugar, cotton, hides, and poultry are produced in the vicinity. Pop. about 10,000.—**OLD CHINANDEGA**, which is contiguous, has a pop. of about 4000.

CHINESE EDIBLE DOG. The kind of dog used as an article of food in China, and reared in order to be so used, being esteemed as a delicacy, is a small dog of greyhound-like form, with somewhat

Chinese Crested (Edible) Dog.

terrier-like head, and muzzle more elongated than in terriers. It is fleet and active, gentle and affectionate. The skin is almost destitute of hair; but there is a variety having a crest of long hair on the head, and a large tuft of hair at the tip of the slender and otherwise naked tail.

CHITTAGONG WOOD, the wood of *Chick-rassia tabularis*, a tree of the natural order *Cedrelaceæ*, a native of the mountainous countries to the east of Bengal. In some parts of India, it is called *Cedar* or *Bastard Cedar*, names, however, which are also given to other kinds of wood. C. W. is much valued in India, and is used for all purposes for which mahogany is used in Britain. It makes beautiful and light furniture, but is apt to warp in very dry weather. Beautifully veined and mottled pieces are occasionally met with, and are highly valued.

CHIUSA, LA (so called from the ground having been originally enclosed as pasture-land for horses), a town of Sicily, in the province and 30 miles south-south-west of Palermo, on the slope of some hills. The town was built in 1320. Agates are found in the vicinity. Pop. (1861) 6592.

CHLO'RODYNE is a patent or quack medicine of considerable popularity, invented by a Dr Collis Browne, but largely imitated by various chemists. It contains opium, chloroform, prussic acid, and probably Indian hemp, and is flavoured with sugar and peppermint. As it is apt to separate into two liquids on standing, it should never be taken unless it has previously been well shaken; and as, in taking a dose of chlorodyne, the patient swallows an unknown quantity of three or four of the deadliest poisons with which we are acquainted, it is always advisable to begin with small doses. It is unquestionably a compound which sometimes succeeds in allaying pain and inducing sleep, when opiates have failed; but whether a physician is justified in recommending a remedy with the composition of which he is unacquainted, is a doubtful question. Ten or fifteen drops is the average dose.

CHOPIN, FRÉDÉRIC, a Polish musical composer of considerable note. He was born at Zelazowa-wola, near Warsaw, in 1810, and studied music at Warsaw under Professor Joseph Elsner. An exile after the revolution of 1830, he took up his residence in Paris, where he lived admired both professionally and in society. His health, always delicate, broke down in 1837, when he went for a time to Majorca, from which he afterwards returned, benefited by the change. After again suffering much from illness and depression of spirits, he visited England and Scotland in 1848, and in London was welcomed with enthusiasm in public and private. He never recovered from the fatigues of this journey, but died in Paris, 17th October 1849, and was buried, by his desire, beside Bellini, in the cemetery of Père-la-Chaise. His compositions, restricted to pianoforte music, are in high esteem among musicians, and consist chiefly of preludes, nocturnos, polonaises, mazurkas, and waltzes, with a few concertos and sonatas. They are pervaded by a sensitive, restless, and highly poetic fancy, and abound in subtle ideas, graceful and original harmonic effects, and rich ornamentation. The so-called polonaises, mazurkas, and waltzes are not dance music, but dreamy compositions suggestive of the rhythm and character of these dances, in which the peculiarities of Polish national music are blended with French elegance and taste.

CHRONOGRAPH. Different forms of time-measurers, or time-recorders, under this designation, have been invented within a recent period.

Benson's chronograph is intended to measure intervals of time down to tenths of a second, for use at horse-races and other occasions where a seconds watch is not exactly suited. It has an ordinary quick train lever movement, carrying hands which move over a dial. One of these is a seconds hand, very peculiarly made. This seconds hand is

double, consisting of two distinct hands, one superposed on the other. The outer end of the lowermost hand has a small cup with a minute hole at the bottom; while the corresponding end of the uppermost hand is bent over so as exactly to reach this puncture. The little cup is filled with ink, having a consistency between that of writing fluid and printers' ink. Suppose that a horse-race is about to take place. The observer keeps a steady look-out for the fall of the starter's flag, or whatever the signal may be; he gives a pull to a cord or string connected with the mechanism peculiar to the instrument; by this movement, the outer and bent end of the upper seconds hand dips down through the ink-cup in the lower hand, and through the puncture to the dial. A small black spot or mark is thus made upon the dial-plate; and this is repeated as each horse passes the winning-post. If the eye and hand of the operator are quick and accurate, there is a reliable record thus presented by the instrument of the duration of the race, sometimes as close as one-tenth of a second. The instrument is now adopted at the principal races as a suitable one for the purpose; recent instances were the Derby, the Oaks, the Goodwood, the Newmarket, and the St Leger of 1867. It will probably be available for many other purposes.

Strange's chronograph is designed for a more scientific purpose, and constructed with more careful details. The object is to measure extremely short intervals of time, for the determination of longitudes in great trigonometrical surveys. The observer, when a particular star traverses the field of his telescope, touches a small ivory key; and on the instant, a dot or mark appears on a sheet of paper coiled round a barrel. The instrument being connected with an astronomical clock, there is a dot made for every beat of the pendulum; and as these dots are a considerable space apart (considerable, that is, for the refined instruments of the present day), it is possible to determine so wonderfully minute an interval as one-hundredth of a second. One of these machines, made at Paris under the direction of Lieutenant Strange, was exhibited in 1865 at the Soirée of the President of the Royal Society; it was intended for use in the great trigonometrical survey of India.

Other forms of chronograph have been adopted by astronomers. One was suggested by Professor C. A. Young in 1866 to assume the functions of a recording chronograph, by marking the instant of observation in hours, minutes, seconds, and hundredths of a second, in printed characters, and in a form suitable for preservation and reduction. Diagrams of the apparatus, given in the *American Journal of Science and Art*, shew a somewhat elaborate combination of wheels, cylinders, magnets, armatures, keys, dials, type-wheels, &c.; but the plan, we believe, has not yet been practically tried.

CHRYSOBALANA'CEÆ, or **CHRYSOBALANEÆ**, according to some botanists, a distinct natural order of plants; according to others, a sub-order of *ROSACEÆ* (q. v.). They are distinguished from the other plants usually included in the order *Rosaceæ* by their irregular petals, and by having the stamens also irregular, either in size or position; the ovary stalked, its stalk adhering on one side to the calyx, the style proceeding from its base. The fruit is a drupe of one or two cells. The species are trees or shrubs, natives generally of tropical and sub-tropical regions. About 50 species are known. The fruit of many is eatable, as the *Coccoloba* PLUMS (q. v.) of the West Indies (*Chrysobalanus*), the fruit of *Parinarium excelsum* in Sierra Leone, and that of *Mocoulea grandiflora* in Brazil. The kernels of some resemble sweet-almonds, as those of

Parinarium campestre and *P. montanum*. A useful oil is expressed from the seeds of *Prinsepia utilis*, a spiny plant, common in some parts of the Himalaya Mountains, and which is also planted for hedges in the Khasia Hills, at an elevation of 5725 feet above the sea; whilst in Sikkim, it is only found where the elevation is above 8000 feet. This plant would in all probability succeed well in Britain, and an attempt should certainly be made to introduce it.

CHUCUITO, or CHUQUITO, a town of Bolivia, in the dep. of Puno, and 100 miles east-north-east of Arequipa, on the west shore of Lake Titicaca, at the mouth of a stream flowing from the Andes. It was formerly of much greater size and importance than it is at present, having had, it is said, at the beginning of the 18th c., the incredible number of 300,000 inhabitants. Its present pop. is only about 5000. In the province of the same name, of which it is the capital, there are mines of silver and gold, and interesting antiquarian remains.

CHU'NAM, the Indian name for a very fine kind of quick-lime made from calcined shells or from very pure limestone, and used for chewing with Betel (q. v.), and for plaster. Both recent and fossil shells are used for making chunam. Extensive beds of fossil shells employed for this purpose occur in the south of India, particularly in low marshy situations near the sea-coast. The shells used are in the first place very carefully cleaned; they are then calcined in kilns, with wood charcoal. When chunam is to be used for plaster, it is mixed with fine river-sand, and thoroughly beaten up with water. A little *jaggery* (coarse sugar) is also added. When very beautiful work is desired, three coats of chunam are given to the wall, and the result is a plaster almost equal to marble in its polish and beauty. The third coat is applied in the form of a very fine paste, consisting of four parts of lime and one of fine white sand, beaten up with whites of eggs, sour-milk, and *ghce* (butter). After it has been rubbed on with a wooden rubber, the surface is washed with a cream of pure lime, and is rubbed with a polished piece of quartz or rock crystal. During this process, the wall is sprinkled with powder of pot-stone, and the rubbing is continued until the wall is quite dry, every trace of moisture being finally removed by a cloth. Chunam is an important article of trade in India.

CHUR (Fr. *Coire*, anct. *Curia Rhetorum*), a town of Switzerland, capital of the Grisons, in the valley of the Upper Rhine, in a fertile plain about 2000 feet above the sea, and surrounded by high mountains, 60 miles south-east of Zurich, on the Plessur, about a mile from its junction with the Rhine. It is of importance as standing on the great road to Italy by the Splügen and Bernardin passes, and thus possessing a considerable transit trade. C. stands on uneven ground, has narrow streets, and is divided into a high and low town. The bishop's palace, and the quarter around it, inhabited by the Roman Catholics, occupy the summit of an eminence, and are separated from the rest by walls and battlements, closed by double gates. In the same quarter stand the old cathedral, a round, arched, or Byzantine edifice, founded in the 8th c.; the Church of St Lucius or the *Dom*, a curious example of early-pointed Gothic, including fragments of earlier buildings. It contains singular old carving, paintings, and statues, and also, it is said, the bones of St Lucius, who was a British king. Behind the episcopal palace is a kind of ravine lined with vineyards. In the lower town there are also some very ancient buildings. Romanach is still spoken in the vicinity; a newspaper in this dialect is published in the town; and a considerable collection of Romanach literature is to

be found in the library of the cantonal schools. There are several new roads leading in different directions through the Grisons; and a railway connects the town with Zurich and other places. There are manufactures of zinc wares and cutting tools. Pop. (1860) 6990, of whom about 1000 are Catholics.

CIALDINI, ENRICO, son of Giuseppe Cialdini, civil engineer in the Modenese service, was born at Castel Vetro, in that duchy, August 10, 1813. Incurring the displeasure of his Jesuit preceptors, he was sent by his parents, who designed him for the medical profession, to study at the university of Parma. When the abortive insurrection of 1831 broke out in the duchies, C. joined the volunteers of Reggio; and on the capitulation of Ancona, embarked for France. Here he resumed his medical studies, living in the Rue de la Harpe, and eking out his scanty means by translating for the booksellers. The struggles against absolutism in the Iberian Peninsula opened anew the career of arms to the Italian exiles. He determined to join the legion raised by Don Pedro in France against the Miguelists. A severe attack of cholera delayed his departure till March 1833, when he sailed for Oporto with letters of introduction from several Parisian notabilities. Arrived off the port, he threw the letters into the sea, determined to trust to his merit alone, and enlisted as a private in the 2d Regiment, composed mainly of Italian refugees. His great personal courage soon secured his promotion; and the unanimous vote of his comrades pronounced him the worthiest man to receive the Order of the Tower and Sword decreed by the government to his company.

After the capitulation of Evora, C. joined (October 22, 1835) the legion of Oporto, formed under Borso di Carminati for service in Spain. In this force, in which Fanti and Durando were officers, C. gained further honours. At Cherta he received the Cross of San Ferdinand; and in the retreat from Morella, by a great effort of strength and courage, saved the life of his brother Guido. In 1839, he exchanged, with some sacrifice of rank, into the regular army, in which, at the close of the war, he found himself captain with another decoration. The fact that some of his old chiefs conspired against Espartero in 1841, seems to have caused him to be sent on half-pay to Valencia, where he married a lady of good family. In 1843, he followed Narvaez in his march against Madrid; was made by him colonel of the regiment of St Ferdinand; and afterwards employed in organising the Civil Guard on the model of the French *gendarmérie*. He was in this force when Charles Albert headed the Italian rising in 1848. A bold and loyal soldier, C. had always kept aloof from the plots of the secret societies; but now he at once threw up his appointments in Spain, and hurried to Italy, arriving in time to aid his old comrade Durando in the defence of Vicenza. Here he received a dangerous wound, and fell into the hands of the Austrians. On his release, he was employed by the Sardinian government in the arduous task of reducing to regular discipline the unruly volunteers from the duchies. He succeeded at last, and fought well at the head of his new regiment in the brief campaign of 1849. During the ten years that elapsed from the defeat of Novara to the renewal of the war in 1859, C. was actively employed. In the Crimea, he commanded the 3d division of the Sardinian Contingent; and on his return was appointed inspector-general of Bersaglieri and aide-de-camp to the king—a rare distinction for a man of plebeian origin. He was entrusted by Cavour with the formation of the famous Cacciatori delle Alpi, placed under the command of

Garibaldi after the declaration of war, and co-operated actively with them at the head of the 4th division. The victory at Palestro was his chief exploit, the further progress of the Italians being stopped by the peace of Villafranca. In 1860, the success of Garibaldi in the south, and the formation of a papal army, led to the intervention of Piedmont. Fanti entered the States of the Church with two divisions, one of which was under the command of Lieutenant-general Cialdini. The campaign thus commenced was the most brilliant in C.'s history. He reduced Pesaro; intercepted, by a prompt and skilful movement, the march of Lamoriciere on Ancona; defeated him at Castelfidardo, and compelled Ancona to surrender. Then turning southwards, where the irregular forces of Garibaldi were beginning to weary before a first-class fortress and a veteran army, he defeated the troops of Francis II. on the Garigliano. Diplomacy delayed the fall of Gaeta till February 13, 1861, when it yielded to C. after a vigorous bombardment, as did the citadel of Messina shortly afterwards. Turin erected a statue to C. (*Vincitore Sempre*), and Reggio elected him deputy in April. In the following summer, he was sent as governor to Naples; but was relieved in a few months at his own request. He had also to act against Garibaldi on the occasion of the second Sicilian expedition. When the army of Italy was reorganised in 1863, C. was appointed to one of the chief commands, with Bologna as head-quarters. Senator in March 1864, he signalled himself by his brilliant speech in favour of the transfer of the capital (December 1864). In the war of 1866, the advice of La Marmora was followed, and the defeat of Custoza was the result. C. was thus prevented from acting on the line of the Po; and before a new campaign could be fairly opened, the cession of Venetia put an end to active operations. La Marmora resigned his command as chief of the staff in favour of C., and some bitter words are said to have been exchanged on the occasion.

CICINDELA, a genus of insects of the order *Coleoptera*, section *Pentamera*, the type of a large family, *Cicindelidae*. This family is nearly allied to *Carabida*, and the insects belonging to it are among

Cicindela campestris, larva and perfect insect.

the most voracious of those beetles which, both in their perfect and larva state, prey on other insects. They have a strong head, with projecting toothed mandibles, and are particularly distinguished by a sort of hook or nail, which is articulated by its base to each of the lower jaws or maxillæ. They are more abundant in tropical than in cold countries; a few species, none of them large, are found in Britain. The head of the larva is large, concave above, and the back furnished with two remarkable hooked spines, which are said to be used as anchors to fix it at any part it chooses of its burrow in the earth; whilst the soil which it excavates, is carried to the mouth of the burrow in a sort of natural basket formed of the concave back of the head and the recurved mandibles. The larva lies in wait in its burrow, its head just level with the ground, till its prey comes within reach, upon which it suddenly rushes.—*C. campestris*, a green species with whitish spots, is common in most parts of Britain, in dry sandy places exposed to the sun.

CINALO'A, a town of Mexico, in the state of the same name, on the Rio Cinaloa, about 50 miles from its entrance into the Gulf of California. It is a thriving place, with gold-washings in the vicinity. Pop. about 9000.

CINISI, a town of Sicily, in the province of Palermo, 14 miles west-north-west of Palermo, near the coast. It is a neat, cheerful town, with straight, regular streets, and has 6714 inhabitants. The Benedictine convent here was once a feudal castle.

CINNAMIC ACID AND THE CINNAMYL SERIES. Cinnamyl is a compound radical, as yet unisolated, which is represented by the formula $C_{12}H_9O_2$, and which includes amongst its compounds cinnamic acid ($C_{12}H_9O_2 \cdot HO$), oil of cinnamon, which is chemically a slightly impure aldehyde of cinnamic acid, or a hydride of cinnamyl ($C_{12}H_9O_2 \cdot H$), chloride of cinnamyl ($C_{12}H_9O_2 \cdot Cl$), styrone or peruvine, known chemically as cinnamic alcohol ($C_{12}H_{11}O_2$), cinnanol and styrol, each represented by the formula $C_{12}H_9$, and styracin ($C_{12}H_{11}O_2$). We shall briefly notice the most important of these compounds—viz., cinnamic acid and oil of cinnamon. *Cinnamic Acid* ($C_{12}H_9O_2$) crystallises in colourless prisms, which are sparingly soluble in cold water, but dissolve readily in boiling water, alcohol, and ether. It fuses at 266°, and boils with or without decomposition, according to the manner in which it is heated, at about 570°. It is converted by most decomposing agents into benzoyl compounds, such as benzoic acid, oil of bitter almonds, &c.; for example, when fused with hydrate of potash, it assimilates the elements of water, and breaks up into acetic and benzoic acids; when boiled with peroxide of lead, it is converted into oil of bitter almonds and benzoic acid, &c. It exists naturally in a free state in liquid storax, the balsams of Tolu and Peru, and gum benzoin, and is often deposited in large crystals from old samples of oil of cinnamon and from cinnamon water. It is always formed from oil of cinnamon when the latter is exposed to the action of the air, and it has been synthetically or artificially formed by exposing equivalent quantities of chloroacetyl ($C_2H_3O_2 \cdot Cl$) and oil of bitter almonds ($C_7H_7O_2$) to a prolonged heat in a closed glass tube. *Oil of Cinnamon* and *Oil of Cassia*, although prepared from different kinds of trees, are virtually identical in their composition, each consisting mainly of cinnamic aldehyde, or hydride of cinnamyl, mixed with certain resinous matters. Oil of cinnamon is an article of the materia medica, and in doses of one minim to a five-grain pill, forms an excellent aromatic addition to cathartic pill-masses.

CITRIC ACID ($C_6H_8O_7$ or $C_6H_7O_7 \cdot 3HO$) is a powerful tribasic acid, which crystallises in large transparent colourless prisms. These crystals are readily soluble in water and alcohol, but are insoluble in ether. The crystals contain two atoms of water of crystallisation (not expressed in the above formulae), which are expelled at a temperature of 212°. Citric acid has a strongly acid taste and reaction, and displaces carbonic acid from the carbonates. Its watery solution quickly becomes mouldy on exposure to the air, and the acid is then found to be converted into acetic acid. When heated to about 350°, vapour of acetone and carbonic oxide are given off, and a residue of aconitic acid ($C_{12}H_8O_{12}$), an acid occurring in the leaves and roots of monkahood and other species of Aconite, is left; and when fused with potash, it assimilates the elements of water, and is decomposed into oralic and acetic acids, as shewn in the equation:

These reactions illustrate the changes which organic acids naturally undergo in the vegetable kingdom. It is to the presence of citric acid that a great many fruits owe their agreeable acidity. It occurs in a free state either alone or associated with malic and tartaric acids in oranges, lemons, cherries, currants, raspberries, gooseberries, strawberries, whortleberries, &c., and in several tubers and bulbs, as in the potato and onion. It also exists in combination with potash or lime in potatoes, onions, and artichokes.

This acid, which is almost always prepared from lemon or lime juice, is thus obtained. The juice, after undergoing incipient fermentation, is filtered, and neutralised with chalk; and the insoluble citrate of lime thus formed is decomposed with very dilute sulphuric acid. On the removal of the sulphate of lime that is thus formed by filtration, the solution of citric acid must be concentrated till a film begins to form, when the crystals readily separate on cooling. Citric acid has also been prepared from unripe gooseberries, whose juice is allowed to ferment; and after the removal of the alcohol by distillation, the acid is separated in the way already described. 100 lbs. of gooseberries yield 10 lbs. of spirit of spec. grav. 0.928, and 1 lb. of crystallised acid.

Citric acid is used largely in manufactures; calico-printers employ it for discharging the mordant from the cloth in patterns; and it is used in dyeing silk with safflower, and for heightening the tint of cochineal. The raw material from which the acid for these purposes is obtained is a black fluid like thin treacle, which comes from Sicily, and is obtained by inspissating the expressed juice of the lemon after the rind has been removed for the sake of the essential oil.—*Watts's Dictionary of Chemistry*, vol. i. p. 995.

The most important of the numerous salts of citric acid are the citrates of lime, potash, ammonia, and iron. *Citrate of Lime* ($C_6H_8O_7 \cdot 3CaO + 4Aq$) is formed in the preparation of citric acid, and is a fine white crystalline powder, more soluble in cold than in hot water. *Citrate of Potash* ($C_6H_8O_7 \cdot 3KO + 2Aq$) is formed by neutralising the acid with carbonate of potash, and crystallises in clear deliquescent needles, insoluble in alcohol. *Citrate of Ammonia* ($C_6H_8O_7 \cdot 3NH_3O$) can only be obtained in solution. *Citrate of Iron* is prepared by dissolving freshly precipitated peroxide of iron in a warm solution of citric acid; a reddish-brown solution is formed, which, on evaporation, yields brilliant scales of a light-brown colour. Excepting the first, all these salts are employed in medicine—the citrates of potash and ammonia as diaphoretics and febrifuges (see **AERATED WATERS**), and the citrate of iron as a tonic. Lemon juice, in which citric acid is the most active ingredient, is a most valuable medicine in scurvy, active hemorrhage, rheumatism, &c.; and when it cannot be obtained, citric acid is the best substitute. The general uses of citric acid in combination with an alkali have been already noticed.

CIVITANOVA, a town of Central Italy, province of Macerata, 12 miles west of the town of Macerata. Pop. (1861), including the port, 4278. It stands not far from the Adriatic, and has a fine harbour, much frequented. Its lands produce vines, olives, and pasturage. It is an industrial and commercial city.

CLAVARIA, a genus of *Fungi* of the division *Hymenomycetes*, subdivision *Clavati*. The spores are produced equally on all parts of the surface. The species are numerous, some of them simple and club-shaped, some branched. Some are natives of Britain. *C. Botrytis*, a species common in oak and beech woods in Germany, growing on the ground,

among moss, grass, heath, &c., is gathered when young, and used as food, having a very agreeable sweetish taste. It ceases to be edible when it becomes old. Another German species, *C. flava*, which grows on sandy ground in fir-woods, is used in the same way. Other species appear to possess similar properties, and Liebig found them to contain the saccharine substance called Mannite. *C. Botrytis* is the *Keulenpilz*, and *C. flava* the *Ziegenbart* (goat's-beard) of the Germans.

COACH-DOG, or **DALMATIAN DOG**, a variety of dog apparently allied to the hounds, although it is said to be deficient both in keenness of scent and in sagacity. It is often kept in stables, becomes attached to the horses, and may be seen running after carriages. Its general light colour and numerous dark-brown spots are constant characteristics; as are also its short hair, tail destitute of brush, and inoffensive disposition. Its origin is uncertain; the name Dalmatian is probably altogether misleading; and it is supposed that it may have been brought from India, where a very similar kind of dog exists.

COAL-SUPPLY. Referring to **CARBONIFEROUS SYSTEM** and **COAL** for various details connected with the localities of coal-beds, the diversity of qualities, and the modes of working, we shall treat here of a question which has recently been accepted as one of great importance to the welfare of the nation—viz., the amount of available supply. All the coal now existing was formed untold ages ago, when the conditions of temperature and moisture on the earth's surface were different from those now prevailing. Coal is not a growth annually renewable, but an accumulation which we are gradually spending. We are living, not on the interest of our coal, but on the capital. This is a truth which scientific men have recognised for some time past; but statesmen and manufacturers, mine-owners and merchants, have paid singularly little attention to the subject, under the supposition that the existing stock will last for so great a period as to relieve us from all anxiety on the matter. John Williams in 1789, Sir John Sinclair in the *Statistical Account of Scotland*, Robert Hold in 1812, and Dr Buckland in 1830 were almost the only writers, until recently, who cautioned England that her supply of coal will not last for ever. Two volumes on the *Coal Question*, by Mr Hull and Mr Jevons respectively, have now, however, effectually roused public attention to the matter.

At the Newcastle meeting of the British Association, in 1864, Sir W. G. Armstrong, as chairman, forcibly urged the subject on the attention of scientific and practical men. He said: 'Contemplating the rate at which we are expending those seams of coal which yield the best qualities of fuel, and can be worked at the least expense, we shall find much cause for anxiety. . . . We have already drawn from our choicest mines a far larger quantity of coal than has been raised in all other parts of the world put together; and the time is not remote when we shall have to encounter the disadvantages of increased cost of working, and diminished value of produce.' He urged especially that we ought not to squander our coal as at present. We waste nearly all the smoke, heated air, and heated gases from our furnaces; we waste sadly in our open fire-places; and there is a vast quantity of small-coal recklessly burned at the pit's mouth. Various statistics as to supply and consumption had furnished Sir W. G. Armstrong with his data. So widely have estimates differed as to available quantity still in store, that between 1792 and recent times, the conjectures, for Northumberland and

Durham alone, varied from 200 years to 1700 years, as the period during which the whole nation could be supplied from this one coal-field; but more earnest attempts have been made in late years to arrive at approximate figures. In 1854, it was estimated that the coal-fields of the United States covered 130,000 sq. m.; United Kingdom, 12,000; Spain, 3400; France, 1700; Belgium, 500: and that the annual produce was in the United Kingdom 31,000,000 tons; Belgium, 5,000,000; France, 4,000,000; and United States, 4,000,000. But this estimate for the United Kingdom was very far below the truth. In 1857, M. de Carral, a Prussian mining-engineer, estimated the whole coal-mining of that year in all countries at 125 million tons, with an average value of 7s. per ton at the pit's mouth; he credited Prussia with enough unexhausted coal to supply all the world for 900 years. In 1861, Mr Robert Hunt ascertained, by reliable mineral statistics, that Great Britain raised 86 million tons in the year; that the quantity was increasing by nearly three million tons every year; and that we were working our mines at thrice the rate which had been in force 20 years before. These facts had much influence in drawing the attention of public men to the subject. The produce of Great Britain in 1861 was from 3052 collieries; and the different districts joined in the supply as follows: Durham and Northumberland, 19 million tons; Lancashire, 12; Yorkshire, 9; Staffordshire and Worcestershire, 7; South Wales, 7; Derbyshire and Nottinghamshire, 5; Scotland, 11; all other districts, 16—amounting to a total of 86 million tons. M. Burat, in his *Situation de l'Industrie Houillère en 1864*, estimated the coal-produce of the world at 141 million tons, of which he credited Great Britain with about four-sevenths. In the same year, Sir W. G. Armstrong, taking Mr Hull and Mr Hunt as his authorities, estimated the available stock of coal in the United Kingdom at 80,000 million tons, rejecting all seams below 4000 feet as too deep to work, and all less than two feet thick as too thin to work. Taking 1864 as a standard of consumption, it would last 930 years; but at the rate of increase of recent years, it would only last 212 years, because this rate would be geometrical and not merely arithmetical in its progression. He further estimated that the available seams of the Tyne, Wear, and Tees district, at the present rate of increase, will barely last 100 years—especially if we continue, as at present, to burn 2½ million tons per annum at the pit's mouth in the Durham and Northumberland collieries. In 1865, the estimate of production was 93 million tons, of which 30 million was used for our own domestic fireplaces, 25 million in iron manufactures, 9 million exported, and 29 million miscellaneous. For the year 1866, the produce exceeded 100 million tons.

In the year 1866, the question came into the arena of the British parliament. On April 17, during a discussion in the House of Commons on the malt-tax, Mr J. Stuart Mill urged the propriety of commencing some arrangements or other for paying off the national debt; recommending the present prosperous state of the nation as a suitable time for making a beginning, and not postponing it to a date when the exhaustion of our coal would place us at a relative disadvantage. He dwelt on the fact, that coal is one of our greatest sources of national wealth; and he accepted as trustworthy the calculations of Mr Jevons—that in three or four generations, we shall have scarcely any usable coal at a less depth than 4000 feet, a depth which will either be unworkable, or workable only at a greatly increased cost. This speech made a great impression on the House; and the government, a few days

afterwards, undertook to ascertain what facts the officers of the Geological Survey possessed on the subject. On May 3, the Chancellor of the Exchequer, Mr Gladstone, made his financial statement for the year, in which he accepted Mr Mill's views, based as they were on the opinions of Sir Roderick Murchison, Sir John Herschel, Sir W. G. Armstrong, Dr Percy, Mr Hull, Mr Jevons, and other authorities. He assented to the probability that by the year 1970, if matters go on at their present rate, we shall have no coal left. 'I disbelieve and disapprove,' he added, 'of all attempts to limit by law the consumption of coal. In vain would it be to think of stopping the consumption of coal in this country; in vain would it be to think of diminishing that consumption by the imposition of a tax; and it would be more vain still to think of prohibiting its exportation.' In other words, the remedy, if any, can not be by legislation. Mr Gladstone introduced the subject again on May 24, when proposing a plan of terminable annuities to commence the redemption of the national debt. During the debate, Mr Laing, Professor Fawcett, and Mr Samuelson disputed the theory that the rate of increase in consumption will be in geometrical progression, and they consequently demurred to the conclusion that our available store of coal is so near exhaustion. 'When,' said Mr Laing, 'coal becomes scarce, certain branches of industry in which coal is very largely consumed, will have to be given up to a great extent, and other branches of industry in which coal is less extensively used, will be carried on instead.' The question was brought to a decisive point on June 12, when Mr Hussey Vivian moved an address to the crown, praying for the appointment of a royal commission to investigate the whole matter. In an elaborate and exhaustive speech, he stated his reasons for believing that the forebodings of Mr Hull and Mr Jevons are too gloomy—that advancing science will enable miners to contend against the temperature and pressure of deeper mines than have hitherto been thought practicable; that we shall be better able than ever to ventilate and drain the deep workings; that the area of coal workable even with our present means is larger than has been estimated; that the magnesian limestone and new red sandstone beds are likely to afford an opening for new stores of coal quite incalculable in amount; that the theory of an increase of consumption in a geometrical ratio is not tenable; and that we shall probably economise consumption in future years by the adoption of new processes, new furnaces, new stove-grates, smoke-consuming apparatus, and the utilisation of waste heat and gases. Although entertaining these favourable views, he nevertheless suggested official inquiry. The government assented; and a Royal Commission, comprising the Duke of Argyll, Sir Roderick Murchison, Sir W. G. Armstrong, Mr Vivian, Mr Prestwich, Dr Percy, Mr Jukes, Mr Robert Hunt, and several other experienced men, was appointed in July 1866. The labours of this important commission were still in progress in September 1867.

COATBRIDGE, a rising and prosperous town of Scotland, in the parish of Old Monkland, about eight miles directly east of Glasgow, on the Monkland Canal and Caledonian Railway. The town is straggling, has some good houses, and a number of small villages or suburbs on its outskirts. There are six churches besides the parish church, two academies, and several other schools, banks, &c. The town is in the centre of a mineral district, is surrounded by about fifty smelting-furnaces, and contains eight malleable iron works, one tin-work (the only one in Scotland), and several other works connected with the iron manufacture. C., owing

COBAN—COHESION-FIGURES.

to the great increase in the iron trade, has grown very rapidly in size and prosperity within the last 20 years. Pop. (1831) 741; (1841) 1599; (1851) 8564; (1861) 10,501; and still rapidly increasing.

COBAN, a town of Central America, Guatemala, in the dep. of Vera Paz, in a fertile valley on the Rio Dolce, 55 miles north of the town of Guatemala. The inhabitants are nearly all Indians, are generally industrious and some of them wealthy, and possess plantations of sugar-cane, bananas, pimentos, and various kinds of fruit-trees. Pop. estimated at 14,000.

COCCOMILIA, or **COCUMIGLIA** (*Prunus coccimilia*), a species of plum, a native of Calabria, and of which the bark—particularly of the root—is much used in that country for the cure of intermittent fevers. Its valuable qualities have been strongly attested by Neapolitan physicians, and it is employed both in private practice and in military hospitals, but it has not come into use in other countries. The C. has obovate leaves, short double flower-stalks, and austere tawny-yellow fruit.

CO'CUM OIL, a solid oil or vegetable butter, obtained from the seeds of *Garcinia purpurea*, an Indian tree of the same genus with the mangosteen. It is white or pale greenish yellow, brittle or friable, with a faint and not unpleasant odour. It melts at 95° F., but when cooled after being melted, remains liquid to 75° F. It is used for mixing with ghee (butter), and is exported to Britain for mixing with bear's grease in the manufacture of pomatum.

COHESION-FIGURES, a remarkable class of figures produced in liquids by the action of their natural cohesive attraction for the surfaces of other liquids or solids on which they are deposited, or by induced cohesive attraction effected by the means of electricity. They may be described under four heads: (1) The Surface-cohesion Figures of Tomlinson; (2) The Submersion-figures of Tomlinson; (3) The Breath-cohesion Figures of Strehill Wright; (4) The Electric-cohesion Figures of Strehill Wright.

1. *The Surface-cohesion Figures of Tomlinson.*—This class of figures was submitted to the Chemical Section of the British Association by Mr Charles Tomlinson of King's College, London, in 1861. He shewed that a drop of an 'independent liquid,' such as an oil, alcohol, or ether, when gently placed upon chemically clean water, spreads itself out into a definite figure as it enters into solution or diffuses itself over the surface. He stated that each figure is characteristic of the fluid employed, and that any change in the chemical or molecular state of the fluid is attended with a corresponding change in its 'cohesion-figure.' Hence he recommended that these figures should be applied to the qualitative analysis of various liquids whose ordinary methods of testing were inoperative or inadequate. *Cohesion analysis*, performed as he directs, has been applied with signal success in the verification of oils and balsams, and as a ready means of indicating the changes which take place in those bodies by age or oxidation. The cohesion-figures of Tomlinson, from their great beauty and variety, combined with the exquisite harmony of colouring displayed by many of them, have been employed, like those of the kaleidoscope of Brewster, to suggest forms for the pattern-designer.

In the production of cohesion-figures, water was the receiving surface generally employed by their discoverer; but in certain cases, he also employed other fluids, such as mercury, acetic acid, coconut oil, and castor oil in the cold state; and spermaceti, white wax, lard, and sulphur in a

state of fusion. On each of these substances, the liquid to be tested formed a different and characteristic figure, and hence additional means of comparison and verification were afforded. Fig. 1

Fig. 1.

shews the surface-cohesion figure of oil of lavender on water.

2. *The Submersion-figures of Tomlinson.*—In the *Philosophical Magazine* for June 1864, this author brought forward a new series of cohesion-figures of liquids, in which the drop, being of great specific gravity, instead of forming a figure on the surface, sank beneath it, and formed a figure as it slowly made its way to the bottom of the vessel. In order to exhibit these phenomena, he employed a column of liquid in a cylindrical vessel. He states that a solution of cochineal dropped into water formed a figure typical of a large class of these figures. A drop laid on the surface sank down, opened into a ring, which became depressed at two opposite points; from these points, lines of fluid descended, which terminated in secondary rings; the secondary rings, in like manner, drooped down into lines carrying tertiary rings, and so on, until the lower part of the vessel became crowded with a complicated system of drooping rings and lines. Oil of lavender in a column of alcohol, fusel oil in paraffin

Fig. 2.

oil, in benzole, in ether, &c., gave various and distinctive figures. He found that similar figures were obtained by the use of oils dropped into columns

COHESION-FIGURES.

of hot spermaceti, lard, wax, &c.; and that these figures underwent considerable variation under the influence of change of temperature. Fig. 2 shews the submersion-figure of oil of lavender in alcohol; fig. 3, that of fusel oil in paraffin oil. We have

Fig. 3.

already stated that each of these figures, whether surface-figures or submersion-figures, is characteristic of the fluid which forms it; and Tomlinson considers, with regard to the *surface-figure*, that it is a function of the cohesive force and diffusibility of the liquid, and the adhesion of the surface on which it is deposited: he also considered that it might be a function of the solubility and the diffusibility of the fluid in question, or of the solubility, the density, and the molecular attraction; while with regard to the *submersion-figure*, he thought each figure to be a function of the solubility, the density, and the molecular attraction.

3. The Breath-cohesion Figures of Strethill Wright.

—These figures were discovered by Dr Strethill Wright of Edinburgh, and communicated to the Royal Scottish Society of Arts on December 12, 1864. This author, who had long been engaged in observing phenomena connected with the modification of cohesive attraction produced between solids and fluids by heat and electricity, was induced to take up the subject afresh by the publications of Tomlinson, and one of the results was the production of his so-called 'breath-cohesion figures.' He

Fig. 4.

employed as the recipient surface a freshly-split, and therefore chemically clean, surface of mica; on this he placed a single drop of the fluid to be experimented on. He then breathed upon the surface, and instantly the drop flashed out into a figure characteristic of the fluid of which it was composed.

474

By this means, a variety of substances, such as vegetable extracts, tinctures, and essential oils, and animal fluids, such as serum, vaccine lymph, bile, mucus, and urine in its various pathological conditions, could be examined. By dusting the figures with hair-powder or lycopodium, he was also enabled to render them permanent, and to exhibit them in his lectures, expanded to a diameter of fourteen feet by the oxyhydrogen microscope. Fig. 4 shews the cohesion-figure of vaccine lymph; fig.

Fig. 5.

5, that of urine containing a small proportion of bile; fig. 6, oil of bitter almonds. In general appearance, the breath-cohesion figures bear a strong resemblance to vegetable forms, especially to the fronds of the *Desmidiæ*. In many of them, as in

Fig. 6.

the *Desmidiæ*, a very distinct bilateral symmetry is apparent. Others, again, simulate the forms of the larger *Alga*. A great many are resplendent with the hues of the soap-bubble, arranged in concentric bands and curves of excessive beauty; while others are veined throughout so as to resemble sections of agate. Dr Wright considers that the breath-cohesion figure is the product of electric attractive force developed on the freshly-split mica, as a well-known consequence of cleavage.

4. The Electric-cohesion Figures of Strethill Wright. —These figures were described by Dr Wright to the Royal Scottish Society of Arts on April 11, 1864, and are produced by electrifying drops of various

COMAYAGUA—COMPRESSED-AIR ENGINE

fluids placed on a clean plate of glass, vulcanite, mica, or other smooth non-conducting substance. By this method, an endless variety of beautiful dendritic figures are produced, differing not only with the fluid employed, but also with the slightest change in the character of the surface on which it is placed, and with the electricity, whether positive or negative, which is imparted to the drop. The electric-cohesion figures are produced in the following manner: A sheet of plate-glass is laid upon a plate of blackened metal, and in the centre of the glass a drop of the fluid to be operated on is deposited with a clean glass rod. The metal plate and the drop are then connected with the opposite poles of an induction coil (capable of giving a spark of about half an inch in length) in full action, and immediately branches protrude from the drop, which slowly creep over the glass until they closely cover a circle of four or five inches. The accompanying figure (fig. 7) shews that produced on a surface of mica by the positive pole

Fig. 7.

from a solution of cyanide of potassium. Sulphuric acid, and solutions of potash, deliquescent salts, and organic fluids, give the best figures; while nitric and muriatic acids and distilled water do not form figures under the electric influence.

COMAYAGUA (formerly **VALLADOLID LA NUEVA**), chief city of Honduras, Central America, 190 miles east of Guatemala, in a fine but unhealthy valley, 1800 feet above the sea, on the right bank of the Humuva, which flows into the Pacific. The city was founded in 1540, is the see of a bishop, has a cathedral, college, ecclesiastical seminary, several convents, and a rich hospital. Pop. 8000; it was 18,000 previous to 1827, when the city was burned by the monarchical faction of Guatemala, and has never since wholly recovered.

COMMEMORATION, or **ENCÆNIA**, the great festival of the Oxford academic year, usually takes place on the third Wednesday after Trinity Sunday. It is of very ancient date, public exercises and recitations having been held from time immemorial in honour of the act, or period when Masters of Arts and Doctors complete their degrees, at first in St Mary's Church, but subsequently to the erection of the Sheldonian Theatre (1669), in that building.

At present, the proceedings consist of a Latin oration in honour of founders and benefactors, delivered in alternate years (according to the bequest of Lord Crewe, Bishop of Durham) by the Public Orator and the Professor of Poetry; the

presentation of the honorary degree of D.C.L. to strangers eminent in science, politics, &c., who are introduced to the Chancellor, or, in his absence, to the Vice-chancellor, by the Public Orator, in a short Latin speech; and the recitation of the *Newdigate* or English prize poem, the Latin prize poem, and the Latin and English prize essays, the three last named prizes being the gift of the Chancellor. During the ceremonial, the northern extremity of the theatre is occupied by the Vice-chancellor, doctors, proctors, &c.; the area or pit by Masters of Arts and their friends; the lower seats in the semicircle by lady visitors; and the upper, or gallery, by Bachelors and Undergraduates, who claim on this occasion all the time-honoured privileges of a gallery audience. Commemoration Day itself is only the culminating point of a week of gaiety, in which concerts, balls, theatrical representations, &c. replace the usual studies of the university, and in which heads of houses and tutors are only tolerated in so far as they give a sort of official sanction to the general festivity. In the theatre itself, the more strictly academic and solemn portion of the proceedings receives but scanty respect from the majority of the audience. A momentary pause may perhaps be made when the '*Newdigate*' is being recited, or when some '*lion*' of unusual mark advances to receive his degree; but as a rule, the noisy humours of the gallery command much more attention than the stately periods of the Public Orator, or the timid recitations of the prize essayists. Of late, however, a feeling has sprung up among the senior members of the university (shared in, it is said, by several distinguished strangers) that the licence of the gallery has exceeded all due limits, and it is not impossible that before long the date of commemoration may be altered to a time when the undergraduates are not in residence.

The Vice-chancellor, who holds his office for four years, generally presides at Commemoration, but it is usual for the Chancellor to do so once in the period of each vice-chancellorship. These occasions are called *Grand Commemorations*.

COMMENTRY, a town of France, in the dep. of Allier, eight miles south-east of Montluçon, on the Oueil. It stands in the centre of one of the most important coal-fields of France, and within the last thirty years has risen from a mere village to be a busy and populous town. Pop. (1866) 7920, mostly engaged in the coal-mines and iron-works. A railway connects it with Montluçon and other places, and with the Canal de Berry. In 1846, an immense fire consumed an enormous quantity of the coal in the mines.

COMPRESSED-AIR ENGINE. One mode of employing air as a motive-power is described in **CALORIC ENGINE** (q. v.). Another obvious way is to compress it, and then apply it in the manner of high-pressure steam. Although compressed air has been used for working small engines in confined situations, such as Tunnels (q. v.), it is not at all likely that it will ever come into extensive use, owing to the great waste of power attending it. This waste arises from two causes—first, the friction due to forcing the compressed air along a great length of pipe; and secondly, the loss from the dissipation of the great heat which results from its compression. If, say, 100 cubic feet of air is compressed into 1 cubic foot, it will become very hot, and although it is very easy to keep in the air, it is impossible to keep in the heat. In spite of every precaution, the heat will find its way through the vessel in which the air is confined, and through the pipes in which it is being transmitted, and this is equivalent to a portion of the air itself leaking out,

because, when the air is permitted to expand in working the engine, it will not attain the bulk it originally had of 100 cubic feet. The greater the original compression of the air, the higher its temperature will rise; and as this caloric, which cannot be kept from escaping, is practically a part of the bulk of the air, it follows that the loss of power from this cause will increase with the pressure or tension of the air. Even were it possible to prevent the escape of the heat, by covering the vessels and pipes with some non-conducting substance, it would not be practicable to use the hot air in the same way as steam is used, because the lubricating material necessary to keep the piston and slide-valves from 'tearing' would be decomposed by the high temperature. In steam-engines, there is always a small quantity of water in the cylinders and slide-valves, arising from the condensation of a portion of the steam, and this suffices to lubricate the piston and valves. It is well known that when steam is *superheated* so highly as to prevent a slight condensation in the cylinder and slide-valves, they are very rapidly destroyed. Air rises in temperature when very much compressed, and we cannot use it until its temperature falls; and as this involves a great waste of power, it follows that where economy is of any consequence, air cannot be used as a mode of transmitting mechanical power. Indeed, no fluid can be economically used for transmitting power for any great distance. We have just seen that compressed air is very unsuitable; steam is even more wasteful, because it condenses into water in long pipes. Water itself loses much of its force from friction in passing through long pipes, unless they are of very large size; and in applying it to working Hydraulic Cranes (q. v.), where the weight to be raised varies, great waste of power arises from the fact, that the cylinder, in which the ram works, has to be filled every time the crane is worked with water at the full pressure of 600 or 700 lbs. to the square inch, even when a pressure one-tenth of that amount would suffice to raise the weight. In short, the power actually used in working a hydraulic crane is always the maximum, even when the weight to be raised is a minimum. It uses as much power to lift a hundred-weight as it does to lift a ton. The extreme handiness and other practical advantages possessed by the hydraulic cranes leave a large balance in their favour, notwithstanding their waste of power.

In boring the Mont Cenis Tunnel (see TUNNEL), air is compressed at the mouth of the tunnel by the abundant water-power easily obtainable there, and forced along to the working face through small iron pipes, for working the boring-machines. General Haupt, an able American engineer, who has been engaged in some extensive tunnelling operations in the United States, has proposed a plan for using ordinary steam boilers and engines close to the working face in the tunnel, and drawing out the smoke and vitiated air through a wooden trunk, by means of a large fan at the mouth of the tunnel. This scheme offers the very great advantage of having to deal only with air and smoke under pressure differing but little from that of the atmosphere. A wooden trunk of no great strength, and involving little difficulty in keeping it sufficiently air-tight, would take the place of strong cast-iron pipes, which require to be perfectly air-tight, and are necessarily, from their considerable cost, of such a small size as to involve great loss of power in forcing high-pressure air through them.

CO'NCORD, the capital of New Hampshire, U.S.—called RUMFORD before the American Revolution, from which Count Rumford took his title—is on

the right bank of the Merrimac River, 59 miles north-west of Boston, lat. 43° 12' 29" N., long. 71° 29' W. C. is a handsome village, extending two miles along the river, with state-house, state-prison, state lunatic asylum, city hall, two railway dépôts, nine churches, four or five newspapers, and manufactures of carriages, iron, steel, machinery, musical instruments, woollens, leather, &c. Pop. (1860) 10,896.

CONDOM, a town of France, in the dep. of Gers, pleasantly situated on a height on the river Baise, here crossed by two bridges, 25 miles north-north-west of Auch. The town is very old, having been founded in 721, is irregularly built, but has handsome suburbs. It has a handsome Gothic church, an exchange, and two hospitals. There is a very considerable trade in grain, flour, wine, and brandy, and manufactures of cotton and mixed fabrics, cotton yarn, and earthenware. C. was formerly the capital of an extensive district, now comprised in the departments of Gers, Landes, and Lot-et-Garonne. Bossuet was at one time Bishop of Condom. Pop. (1866) of the town proper, 4897.

CONGESTION may be defined to be 'excess of blood in the vessels of a part, with diminished motion of that blood.' The chief causes of congestion may be classed under the two heads of (1) congestion from venous obstruction, and (2) congestion from want of tone in the vessels.

1. *Congestion from venous obstruction* is easily illustrated by tying up the arm, as is done before opening a vein, when the veins are compressed more than the arteries. If the ligature is kept on for a sufficient time, the veins swell, the fingers become red, and then livid, and the whole limb is swollen. Cold applied to the surface of the body acts similarly on it, and contracts the veins more rapidly than the arteries, which lie deeper; and the purple colour of the hands and face after exposure to cold shews the congested state of the capillaries. 'Congestions,' says Dr C. J. B. Williams, 'are caused in external organs by an obstruction of the veins leading from them. Thus, congestion of the brain may be produced by a tight cravat or by a tumour pressing on the jugular veins. Efforts of straining, coughing, holding the breath, and asthmatic paroxysms which impede the flow of blood through the lungs, cause congestion in various parts. Tubercles in the lungs cause congestion of that organ. Obstruction to the transit of blood through the liver causes congestion in the abdomen, hemorrhoids, &c.'—*Principles of Medicine*, 2d ed., p. 180.

2. *Congestion from want of tone in the vessels* includes a numerous class of cases. In atony of the vessels generally, as in extreme debility, certain fevers, &c., there is general congestion of the parenchymatous organs—the lungs, liver, &c.—and the blood gravitates to the lowest parts, giving rise to what is termed *hypostatic* congestion of the posterior parts of the lungs, the skin of the back, &c. In other cases, the weakness is local, as when the feet swell after long standing, in consequence of over-distension of the veins. Similarly, a continued stooping posture may occasion headache, giddiness, and the other symptoms of congestion of the brain. Congestive affections of this kind are often mistaken for inflammation, and instead of being treated by tonics, are treated by depletion, which, although affording temporary relief, increases the evil.

Another cause of congestion is over-excitement of the vessels, and this often occurs at an early stage of inflammation, or as a result of that process.

We must pass over the symptoms and effects of congestion, because they vary very much according to the organ affected, and shall conclude with a few words on the general remedies for congestion. First

in order, we must notice such as remove the cause, as the loosening of a ligature, or the removal of a tumour compressing veins, elevation of the head in affected brain, and the recumbent position in congestion of the hæmorrhoidal or uterine vessels. Pressure, by supporting the weak vessels, and friction, by increasing the onward movement of the blood in the veins, are often of great use. Astringents, such as solutions of alum, sulphate of zinc, tannin, oak-bark, &c., may be applied with advantage locally to certain parts, as the eye, throat, rectum, &c.; and stimulants may be similarly used, as a capsicum gargle to a relaxed sore throat. Medicines of these classes may also be given internally. Thus, the principal action of bark, quinine, and arsenic in the cure of ague is supposed to lie in their reducing the great visceral congestion that is always present. A glass of strong hot brandy and water will often remove a congestive headache, and a stimulant draught will often relieve the pulmonary congestion which follows a fit of asthma. Various remedies are supposed to have a special power of removing the congestion of certain organs: thus, mercurials are recommended for congestion of the liver; digitalis and cantharides for congestion of the kidneys; and squills, benzoin, and the balsams for bronchial congestion.—For further details, the reader is referred to the excellent work of Dr Williams, from which we have quoted.

CONGOON, or KONGUN, a town of Persia, on the Persian Gulf, 130 miles south of Shiraz. It has an excellent and safe roadstead; and both wood and water, which are generally scarce in the gulf, may be obtained here. Pop. 6000.

CONSANGUINITY (Lat. *con*, together, and *sanguis*, blood), the relationship which subsists between persons who are of the same blood. It is either *direct*—which is the relationship between ascendants and descendants—or *collateral*, between persons sprung from a common ancestor. In the direct line, a son is said to stand in the first degree to his father; a grandson, in the second degree to his grandfather; and so on. In the collateral or oblique line, two different modes of numbering the degrees of consanguinity have been in use, the one that of the civil, the other of the canon law. By the civil law, the degrees are separately numbered downwards to each party from the common ancestor, the common ancestor not being counted. Thus, brothers are in the second degree of consanguinity; uncle and nephew in the third; cousins-german in the fourth; and second cousins, or the children of cousins-german, in the sixth degree. By the canon law, consanguinity in the equal oblique line, i.e., where the parties are equally removed from the common ancestor, is computed by the number of degrees between one of them only and the common ancestor; brothers being said to stand in the first, and cousins-german in the second, degree to each other. In the unequal oblique line, i.e., where the parties stand in different degrees of relationship to the common ancestor, the degree is determined by the number of steps between the common ancestor and the party further removed from him: thus, uncle and nephew are computed as in the second degree to each other, because the nephew, the further removed of the two, stands in the second degree to the common ancestor, his grandfather. The canon law computation is more generally used by English lawyers, though statute 22 and 23 Car. I. c. 10 adopts that of the civil law. Scotch lawyers, since the Reformation, have generally used the civil law mode of computation.

Affinity is the relationship brought about by

marriage between a husband and the blood-relations of his wife, or between a wife and the blood-relations of her husband. The relations of one spouse in any particular degree of consanguinity stand in the same degree of affinity to the other spouse. There is no relationship by affinity between the blood-relations of the husband and those of the wife.

Consanguinity and affinity have been at different times and in different parts of the world more or less looked on as impediments to marriage between the parties related. Among the ancient Persians and Egyptians, marriages are said to have been sometimes sanctioned between brother and sister, and even father and daughter. The Athenians, while permitting marriages between brothers and sisters uterine, prohibited them between the same relations by the father's side or the full blood. In the book of Genesis, we read of Abraham marrying his half-sister. The Levitical law prohibited marriage between relations in the direct line, between brother and sister, nephew and aunt, and apparently by implication, uncle and niece. A son was prohibited from marrying his father's wife.

The Roman law prohibited marriage between ascendants and descendants, a prohibition extended to relations by adoption, and even after the dissolution of that tie. In the collateral line, the prohibited degrees included brother and sister (extending to persons so related by adoption where the tie continued to exist), and all cases where one party stood *in loco parentis* to the other, as uncle and niece. Marriage between cousins-german, at one time prohibited, was declared lawful by Arcadius and Honorius. The degrees prohibited in consanguinity were by Constantine also prohibited in affinity.

By the old canon law and early decretals, marriages were prohibited between persons as far removed as the seventh degree of consanguinity or affinity—i.e., between persons who might, by the civil law computation, be within the twelfth degree to one another. The fourth council of Lateran, 1215 A.D., narrowed the prohibition from the seventh to the fourth degree; i.e., the grandchildren of cousins-german. Affinity was held to be constituted not merely by marriage, but by the spiritual relationship of standing sponsor at baptism, and by illicit intercourse; marriage being prohibited between persons one of whom had had carnal connection with a relation in the fourth degree of the other. A marriage between persons related in any of these ways was accounted incestuous, and the children bastards. The pope assumed the right of granting dispensations from impediments to marriage arising from consanguinity and affinity, a power which seems to have been first exercised in the 12th century. In no instances have dispensations been granted to relations in the direct line, but one or two dispensations are said to have been granted between brother and sister; and between uncle and niece, they are still occasionally granted in countries where the canon law continues to be binding. Between remoter relations, they have been common. The extent to which these prohibitions were carried, and the possibility of their being dispensed with, naturally tended to encourage profligacy and lax ideas of the marriage tie, it being hardly possible to say of any marriage that it might not one day be proved invalid. The Council of Trent restricted the impediment of affinity from illicit intercourse to the second degree.

In the countries which embraced the Reformation, a general relaxation took place in the prohibitions to marriage from consanguinity and affinity. In England, 32 Hen. VIII. c. 38 allowed all persons

to marry who were not prohibited by the Levitical law; and according to the interpretation put on this statute, the prohibitions included all relations in the direct line, brother and sister, and collaterals, when one party is brother or sister to the direct ascendant or descendant of the other; the degrees prohibited in consanguinity being equally prohibited in affinity. The prohibitions from consanguinity have been held to extend to bastard relations. But down to 1835, marriages within the prohibited degrees were valid and the issue legitimate, unless the marriage had been annulled by a declaratory sentence of the Ecclesiastical Court, which could only be obtained while both spouses were alive. By act 5 and 6 Will. IV. c. 54, all marriages within the prohibited degrees of consanguinity and affinity were made absolutely void.

In Scotland, for a very short time after the Reformation, the papal power of dispensation was exercised by the crown. Acts 1567, c. 14, and 1567, c. 15, professing to take the Levitical law as the standard, assimilated the prohibitions from consanguinity and affinity to those of England. Incest, or sexual intercourse with persons within the prohibited degrees, was, by the former statute, made a capital crime. As to marriages between bastard relations, the law of Scotland is in a doubtful state; but there is no prohibition against marriage with a relation however near of a person with whom one has had sexual intercourse.

In France, the Code Napoléon prohibits marriage between ascendants and descendants lawful or natural, and persons similarly connected by affinity; and in the collateral line between brothers and sisters lawful or natural, and persons similarly connected by affinity. Marriage between uncle and niece, and aunt and nephew, is also prohibited. In Spain and Portugal, the canon-law restrictions are in full force, with the corresponding system of permissive dispensations. In various countries of Europe, as Denmark, no prohibitions from affinity, except in the direct line, are recognised. In most of the United States of America, marriage is allowed between uncle and niece.

CONVALESCENT HOSPITALS, although as yet rare in this country, are institutions of the greatest importance. All who are acquainted with our ordinary hospitals, which are often situated in crowded parts of populous cities, must feel that a very considerable number of patients must almost of necessity die soon after returning to their own unhealthy homes, simply for want of an institution where convalescence may be developed into perfect health, under the general influences of pure air, gentle exercise, and a nourishing and well-regulated diet. The convalescent hospital must be regarded as a stage in the process of cure intermediate between the ordinary hospital and the patient's home: it is an equally necessary addition both to civil and military hospitals. One of the greatest of our military surgeons, Robert Jackson, writing in 1803, recommends 'separate and detached houses,' and the removal of convalescents 'to other apartments or hospitals.' He states his firm conviction, as based on long and most extensive experience, that soldiers, in a state of convalescence, recover their health better and sooner in sheds, huts, and barns, exposed occasionally to wind and rain, than in the most superb hospitals in Europe. 'Pure air,' he adds, 'in this respect, is alone superior to all forms of cure, and to all other remedies without such aid.' The same great authority frequently notices relapse as being the leading cause of mortality in general hospitals. With regard to the nature and construction of such hospitals, Sir James R. Martin, one of our highest living authorities on sanitary matters, remarks that

'there must be separate and equally well-ventilated apartments for the refreshment of sleep and for that of meals, besides covered-ways for exercise in bad weather, and open spaces for exercise in fair weather. The scale of diet must also rise with the advance towards health. Where practicable, a certain number of convalescent hospitals should be constructed on the sea-board.'—'On Convalescent Hospitals,' in Holmes's *System of Surgery*.

The magnificent establishment at Vincennes, founded in 1857 by the Emperor of the French, may be taken as a type of what convalescent hospitals ought to be. We borrow the details from Sir James R. Martin's article. It is composed of a main building, with two long wings, two stories high, with a ground floor, and contains more than 400 beds. It contains a chapel, airy dining-halls, with marble tables and convenient seats, a library and play-rooms; the wings in both stories being subdivided into rooms, each containing three beds, and looking towards the south. Each patient has the use of a press, with lock and key. There is ample garden-ground attached to the building. The institution is filled by convalescents from the Paris hospitals, from charitable boards, from accidents received in the public dockyards, from members of benefit societies, &c. The mean duration of residence is 22 days, the patient remaining till he is either completely cured, or declared incurable. The diet is regulated by the director and head physician, and usually consists of soup at 7.30 A.M.; meat and vegetables at 10.30 A.M.; soup, roast meat, vegetables, and salad or dessert at 5 P.M.; each convalescent receiving a pint of Burgundy, and as much bread as he may choose. The head physician may modify this diet as he pleases. Numerous means of diversion, as skittles, balls, draughts, dominoes, &c., are afforded, but cards are prohibited; and the library, the greater part of which has been presented by Paris booksellers, is much resorted to, there being on an average fifty readers. The conduct of the inmates is exemplary; submitting without murmur to the regulations, being polite to each other, and respectful to the office-bearers. They are careful of the furniture, garden-flowers, &c., and are attentive to the cleanliness of their rooms. They are allowed to see their friends either in the parlour or the garden on Sunday, Monday, and Thursday. The officers are: a director, treasurer, head physician, and three house-surgeons; six nurses, a chaplain, five clerks, a store-keeper, four overseers, and forty subalterns. The simple fact, that this hospital, in less than three years, administered relief to 14,000 convalescent artisans, affords undoubted evidence, were such evidence required, of the utility of such institutions. Several establishments of the kind are already in operation in England. A convalescent hospital of some size has been recently (1867) erected in the neighbourhood of Edinburgh by the munificence of William S. Brown, Esq., Woodhatch, Surrey. It cost £12,000, and is calculated to accommodate between 50 and 60 patients. It is attached to the Royal Infirmary of that city, and is supported by voluntary contributions.

CO'PRA, the dried kernel of the cocoa-nut, from which cocoa-nut oil has been expressed. It is much used in India as an ingredient of curries, and is a considerable article of trade between one part of India and another, as from the Malabar coast to Bombay, from which it is re-exported to Calcutta.

CO'PTIS. Very similar to the *C. trifoliata*, noticed in the article COPTIS, is *C. teeta*, the *Golden Thread* of Assam, the root of which has long been in high repute in Assam and neighbouring countries. It

has come into extensive use in India as a bitter tonic, and is sold at a very high price. Great efficacy is ascribed to it as a tonic for patients beginning to recover; but it is of no value as a febrifuge.

COQUITO (*Jubca spectabilis*), a beautiful Chilean palm, of the same tribe with the cocoa-nut, rising with a naked stem to the height of 40 or 50 feet, and bearing a crown of wide-spreading pinnated leaves. By cutting off the crown, the sap is obtained in great quantity, continuing to flow for months; and when boiled down to the consistence of treacle, becomes a very sweet syrup, and forms, under the name of Palm-honey (*miel de palma*), an article of great importance in the domestic economy of the Chileans.

CORA'TO, a large town in Southern Italy, province of Bari, 25 miles west of Bari, is situated on a fertile plain, where much cattle is reared. Pop. (1861) 24,576. It is an ugly, dirty town, although it boasts of having been founded by the Normans. It has a fine church, fine convents, and an orphan asylum. It was between C. and Andria that the famous 'Challenge or Tournament of Barletta' took place between 13 Italians and 13 Frenchmen on February 13, 1503, in which the Italians were victors.

CORNWALLIS, CAROLINE FRANCES, was born on the 12th July 1786, and was the younger daughter of the Rev. William Cornwallis, rector of Witterham and Elam in Kent. Her childhood was precocious; but she escaped the usual fate of precocious children. She lived to a good old age; she was even more remarkable as a woman than as a child; and her mind was growing, if not in vigour, in boldness and freshness, even to the last. Her character, as well as her intellectual powers, appear to have been early developed; and from expressions in her mother's Diary, we learn that her premature sensibility at the age of seven caused her relatives no little concern. When she was a little older, she began to produce literary works; and the writing of histories, poems, commentaries, and essays, though not pursued to the exclusion of the ordinary interests of her age, appears to have occupied much of her time, and to have been her chief delight for several years. Some specimens of her juvenile compositions have been included in a volume of her *Letters and Remains*, published in 1864. In character, and in respect of the tastes and abilities which they display, they certainly are very remarkable as the productions of a child. Notwithstanding this early promise, Miss C. was not destined to be an early authoress. She was brought up in the decorous life of an English country parsonage; she was sensible of, and at first, perhaps, was not unaffected by, the prejudice against female authorship which prevailed thirty or forty years ago. It was not till she was getting old that she began to publish books, and even then she was careful to keep her authorship a secret.

She received the school education usually given to young ladies in her time; a worthless education, as she afterwards thought. She was encouraged by her mother and other friends in supplementing it by severer and more useful studies; but the ill-health of her father, which imposed many duties upon her, and the state of her own health, were considerable obstacles to her progress. Gradually, however, she acquired a thorough knowledge of Latin and Greek, and a considerable knowledge of Hebrew; and made herself conversant with nearly every study which occupies the more thoughtful of men—with philosophy, theology, history, natural science, social science, politics, and even law. In her latter days, her knowledge of most of these subjects was only

surpassed by that of men who had taken them for their specialty. From an early age, she carried on a correspondence with many persons whose intimacy was calculated to stimulate and aid her; and a selection from her *Letters* has been published. They are often intrinsically valuable and interesting; and, moreover, they present a curious picture of the progress of her mind and the development of her opinions. In style, they are always excellent, and the subjects treated are very various, and seldom ephemeral. Theology, philosophy, history, politics, and social questions afford the themes she most often discussed with her correspondents. To these *Letters* we are indebted for what little has been made known to us of her life; Miss C. having desired that her life should not be written, and having carefully destroyed the papers which might have supplied the materials of a memoir. As regards religion—the great interest of her life—we learn from these *Letters* how, under the influence of enlarged knowledge and reflection, she gradually drifted away from the narrow orthodoxy in which she had been brought up, and adopted views which some would call more enlarged and rational, others latitudinarian. It is to the study of the Greek Fathers, and to the influence of a long residence in Italy, which began in 1826, that she ascribed the complete change which took place in her religious opinions. It is right to say, that while she was bold and fearless in accepting beliefs far removed from those of her age and country, her faith in Christianity became stronger instead of weaker, and that she was always careful not to wound the honest opinions or prejudices of others. Among the most esteemed of her correspondents was Simondi, who is said to have made her an offer of marriage when she was about 20 years old. The offer was declined, but without causing any abatement of friendship or admiration on either side.

Her first work, *Philosophical Theories and Philosophical Experience, by a Pariah*, appeared in 1842. It was the first of a series entitled 'Small Books on Great Subjects,' which she had formed the idea of writing with the help of a few friends. Of the 20 volumes of this series which appeared between 1842 and 1854, nearly all—all the most important—were written by Miss Cornwallis. The subjects discussed were very various—the Connection of Physiology and Intellectual Science, Ragged Schools, Grammar, Criminal Law, Chemistry and Geology, Greek Philosophy, and the History and Influence of Christian Opinions. The works in which the last-mentioned subject was treated—*The State of Man before the Coming of Christ* (1 vol.), and *The State of Man after the Coming of Christ* (3 vols.)—were the most important of the series. She had designed to add to them one more volume—a Survey of the Present Condition of England, Social, Political, and Religious; but this was never completed. The series attracted much attention in this country, and still more in America; and the books in which Christianity and its influence were considered were so judiciously written, that, though presenting a system of thought and belief entirely different from our orthodox Christian teaching, they were favourably received by many of every religious party. These are still the best short and popular account we have of subjects of great interest and importance, of which the majority of the clergy even were profoundly ignorant twenty years ago. In illustration of the ignorance which prevailed amongst Anglican clergy at a time still recent, Miss C. used to say that she once met a clergyman who had never heard of the Fathers; and that among a multitude to whom she applied for information about their writings, not one knew anything about them. Besides

the 'Small Books on Great Subjects,' Miss C. published in 1847, *Pericles, a Tale of Athens*, which good judges have declared to be an admirable picture of Athenian life; and in 1853, she published a prize essay on Juvenile Delinquency.

From an early period of her life, her health had been infirm; in her later years, it was very precarious, and she was for the most part confined to bed. She lived latterly at Ildwells, near Tunbridge Wells. She died there on January 8, 1858. A voluminous author, her name was at her death unknown to the world, and it remained unknown until the publication of her *Letters and Remains* in 1864. She had two reasons for making a secret of her authorship. First, there was a strong prejudice against female authorship in her young days, and even when she began to write; and she feared not the ridicule or scorn, but the neglect which might await her books were it known that they were written by a woman. She wrote in the hope of doing some good, and she concealed her name, that her purpose might not be frustrated. Secondly, she wished to shew the world what the female intellect was capable of, and the concealment of her name made her secure of impartial criticism. She believed firmly that the intellects of women were not inferior to the intellects of men, and that their apparent inferiority was entirely the result of inferior training. She regarded the praises bestowed upon her books, the acknowledgment of their originality, accuracy, and vigour, as a tribute not to herself but to her sex. If the books do not prove the intellectual equality of the sexes, they certainly prove that Miss C. was a very exceptional woman. We know from her letters and from the testimony of her friends, that her masculine brain and a great stock of erudition did not prevent her from affording a beautiful example of the graces and charms of the feminine character.

CORREGGIO, a town of Northern Italy, province of Reggio, 20 miles east of Parma, on a canal that communicates with the Po. Pop. 2596. It is very handsome, regularly built, and has a castle, a cathedral, and a theatre. It was a barony of the lords of Correggio, who were great patrons of letters. It is the birthplace of the painter Antonio Allegri, surnamed Correggio; and of the engraver Jesi, &c.

CÖTHEN, or **KÖTHEN**, an ancient town of Germany, in the duchy of Anhalt-Dessau-Cöthen, 22 miles south-west of Dessau, and about 82 south-west of Berlin, on a tributary of the Saale, and at the junction of railways from Berlin, Magdeburg, Bernburg, and Leipzig. The streets are broad, the town is neat and well built, is surrounded by high walls, and is divided into the old and new town. It contains a castle with three towers, several churches and schools, a synagogue, a library, a handsome railway station containing a gaming-house, and various charitable institutions. Pop. (1864) 11,985.

COTONEASTER, a genus of plants of the natural order *Rosaceæ*, sub-order *Pomaceæ*, having polygamous flowers; a top-shaped calyx, with five short teeth; five small, erect petals; erect, short stamens; and a top-shaped fruit, the nuts of which adhere to the inside of the calyx, but do not cohere in the centre. The species are pretty numerous, shrubs or small trees; some of them evergreen; with simple undivided leaves, more or less woolly beneath; small flowers in lateral cymes; and small fruit not agreeable to the palate, but the bright colour of which, and its remaining on the tree in winter, make them very ornamental. *C. vulgaris* is a deciduous species, a native of hills in Europe and Siberia, and said to be found wild in a single

locality in Wales. *C. tomentosa* is also found in the Alps. Most of the species are natives of mountainous parts of Asia; they are sufficiently hardy

Cotoneaster vulgaris.

for the climate of Britain, and have become among the most common of our ornamental shrubs. Some of them, as *C. rotundifolia* and *C. microphylla*—both from the north of India—are much used for covering walls.

COTTON FAMINE. The history of manufacturing industry does not present a more striking episode than that which was connected with the effects of the Civil War in America on the cotton manufactures of Great Britain in 1861 and following years.

The years 1859 and 1860, unparalleled for the magnitude of the cotton manufacture, had much to do with the collapse that followed. So rapidly has this branch of industry increased in Lancashire, that the immigrants into that county from other districts have varied from 10,000 to 20,000 a year for a long series of years, irrespective of the natural increase of population by the excess of births over deaths. The imports of raw cotton, the exports of manufactured cotton, the number of mills, the number of hands, all were at their maximum in 1860. The imports were 1390 million lbs., of which 1054 millions were worked up in Great Britain. There were 1920 mills in Lancashire, 275 in the adjacent portions of Cheshire and Derbyshire, and enough elsewhere to make up a total of 2650. There were 440,000 hands employed in these mills; by age, 90 per cent. adults and young persons, and 10 per cent. children; by sex, 44 per cent. males, and 56 females. The machinery was worked by steam-engines having an aggregate of 300,000 horse-power. There were more than 30,000,000 spindles, making from 4000 to 6000 revolutions per minute; and 350,000 power-looms. The fixed capital in mills and machinery was valued at £54,000,000; while the money paid for wages in that year was £11,500,000. The cotton goods of various kinds manufactured for home consumption used up 180 million lbs. of cotton, and were valued at £24,000,000; while the exported goods—consisting of 2776 million yards of calico, muslins, &c., and 197 million lbs. of yarn—were valued at the enormous sum of £50,000,000; besides £2,000,000 more for cotton hosiery and small wares. The

COTTON FAMINE.

total value for home consumption and export, £76,000,000, exceeded the total imperial revenue for that year. Considering that, of 1390 million lbs. imported, no less a weight than 1120 millions came from the United States, there is at once evidence afforded of the tremendous effect that would be produced by any stoppage in the American cotton-trade. Irrespective of this, however, there would have been a stagnation in our manufacturing districts in 1861, even if raw cotton had been plentiful and cheap. The manufacturers had glutted all the markets by the wholly unprecedented extent of their operations in 1860. The English warehouses, as well as those elsewhere, were full; and time was needed to carry off the immense stock. There were cotton goods on hand in Great Britain at the end of the year valued at £20,000,000; while in India our merchants continued to pour in goods even when the consignments of 1860 exceeded £17,000,000.

Fort Sumter was bombarded in April 1861. This was virtually the beginning of the American Civil War, and the beginning also of the rise in the price of cotton. A blockade was early established by the Federal government of Washington; and it was only by 'running' this blockade that cotton-laden ships could clear from the Southern or Confederate ports. The price of Middling Orleans (the kind of cotton mostly used, and that which governs the price of all other kinds) rose from 7½d. to 9d., 10d., and 12d., as the year advanced. There was thus a twofold motive for lessening the operations of the Lancashire mills—the markets were so fully supplied with manufactured goods, that no immediate augmentation was necessary; while the increase in the price of the raw material rendered manufacturing less profitable than before. The Liverpool dealers made colossal fortunes by the enormous rise in price of every bale of cotton which could reach the country from any quarter; while the manufacturers were also prosperous, because they could sell their accumulated stocks of calicos and yarns at much higher prices than had been obtainable in 1860. It was the operatives who suffered. One by one, the mills were put upon half-time, because the mill-owners had not much inducement to spin and weave, under the extraordinary double influence above adverted to. It was not until autumn, however, that these effects were heavily felt, when there was the enormous quantity of 1000 million lbs. of cotton, raw and manufactured, on hand in Great Britain. When half-time began at the mills in October, there were, in Lancashire and the two neighbouring counties, 890 spinning-mills, 593 weaving-mills, 635 spinning and weaving mills, and 152 other cotton-mills of miscellaneous kinds, employing 369,453 factory-hands; and all these four classes of establishments became equally embarrassed. India or Surat cotton could still be had in considerable quantity, at 10d. per lb. instead of its former price of 5d.; but it was greatly out of favour, on account of its dirty condition, and the shortness and hardness of its staple. In November, there were 49 mills stopped, throwing out 8063 hands, while 119 were working half-time—placing something like 20,000 persons on half their usual wages. In December, Middling Orleans rose to 12d. So singular was the state of things, and so unlike what would be called a 'famine,' under other circumstances, that the actual quantity of raw cotton in Great Britain at the end of the year (280 million lbs.) was greater than ever before known in the history of the trade; but as the market-price of yarns and piece-goods at that time scarcely equalled that of raw cotton *plus* wages, the manufacturer could scarcely operate without a

loss; and therefore, he either closed his mill, or placed his hands on half-time. It was not so much a famine of cotton as a famine of employment.

The year 1862 opened very gloomily. Relief committees began to be formed in Manchester, Wigan, Blackburn, Preston, and other towns, to distribute subscribed funds to such of the hands as were totally out of work. The streets were thronged with the unemployed; but there was no disturbance, and scarcely any begging. Sewing-schools were established by ladies in the several districts, to teach the factory girls useful domestic needle-work—of which they are generally very ignorant—to get them to make clothes for themselves and others; and to shield them from the vicious temptations which would beset them during a period of idleness. The ladies also won upon the affection of the girls by reading to them, and sympathising in many ways with their sorrows. Many of the manufacturers set apart large rooms as school-rooms and soup-kitchens for the boys and men, and abundant stores of soup were provided at 1d. per basin. The Poor-law Board sent down instructions to the local guardians how to give as much elasticity as possible to the system of parochial relief. In April, Blackburn had only 18 mills on full-time out of 84, the rest being either on half-time or closed; and there were 9000 of the inhabitants receiving parochial relief. Most of the other towns were in nearly as bad a plight. In May, matters were worse; Preston had 10,000 operatives out of work, and Blackburn had just about half-employment for 27,000. Middling Orleans rose in price to 15d., and manufacturers had more inducement to speculate in cotton than to spin it. Meanwhile, great efforts were made to assist the distressed operatives. The letters of a 'Lancashire Lad' in the *Times*, with the text, 'Con yo help us a bit?' made a great impression. The *Daily Telegraph* raised a fund of £5000 by its own exertions. The Lancashire landowners established a 'Cotton District Relief Fund' in London, to which they subscribed £11,000 in one day; the Lord Mayor established a 'Mansion-house Committee,' which received subscriptions from all parts of the world; Manchester established a 'Central Relief Committee,' as a nucleus for various local funds; while a great county meeting brought in £130,000, of which £70,000 was subscribed in one day in one room. Mr Farnall was sent down by the Poor-law Board, as special commissioner, to superintend the plans for parochial relief. A Rate-in-aid Bill was passed through parliament, to enable the government to issue Orders in Council, authorising parishes to raise money on the guarantee of future rates; it was only to be done where the current poor-rate had already reached a high figure, and the money raised was to be applied strictly to mitigate the distress of the operatives. Notwithstanding all these sources of assistance, the work-people became reduced to great distress. 'The pawnbrokers' stores,' said an eye-witness, 'were glutted with the heir-looms of many an honest family. Little hoards were drained to meet the exigences of the time. Many found it the sorest trial of their lives to ask for food; and it is a happy circumstance for all to remember, as it is honourable to those of whom it is recorded, that none suffered more severely than those who had a struggle to overcome their unwillingness to subsist upon food which they had not earned. Rents were falling in arrears, and many a house which had held only one family, was now occupied by three or four, in order to economise rent, fuel, and furniture.' Nevertheless, none died of privation, and the average sickness was even less than usual. It was a fact well ascertained that spirit-drinking was less indulged in than

COVINGTON—CRAB.

in times of full wages. Meanwhile, the manufacturers began to make great profits; the prices of yarns and calicoes rose rapidly, and the stocks were sold off which had been so long on hand. Middling Orleans rose to 2s. 3d. in October, and thus there was less inducement than ever to purchase for the sake of manufacturing. Strange as it may appear, 50,000 bales of cotton were resold by the manufacturers themselves during the year, at the very time when the phrase 'cotton famine' was on the lips of every one; but the simple fact was, that more profit could be made by reselling than by manufacturing.

It was a gloomy winter, that of 1862—1863, for the mill-hands. In October, the loss of wages was estimated at £136,000 per week. In November, there were 208,000 persons in the Lancashire district receiving out-door parochial relief, and 144,000 others aided by subscribed funds; there were at the same time 20,000 mill-girls at the sewing-schools. At Christmas, there were 250,000 hands totally out of work; those, and about as many more dependent on them, received £40,000 a week from the parishes and the committees. Vast sums were sent from various parts of the world to be spent in winter-clothing only, and prodigious stores of second-hand clothing were contributed by private families. As the money relief seldom exceeded 2s. or 2s. 6d. per week per applicant, to purchase clothing out of this was of course impracticable. The small shopkeepers also suffered greatly; for there was only one-third the amount of wages received by their customers per week that had been received two years before. Emigration schemes were much discussed, but were not carried on very largely, because Lancashire men felt convinced that trade would revive after a time. Meanwhile, the *rate* of wages was not lowered; few mill-owners proposed it, and the operatives were rootedly against it; however small the quantity of work, it was paid for at the old rate.

No date can be named for the actual cessation of the distress; it died out by degrees. When the manufacturers had sold off their old stocks, they recommenced buying more to spin and weave; because, although the price of raw cotton was enormously high (2s. 5d. for Middling Orleans in May 1863), the selling price for calicoes and muslins was now proportionably high, and therefore they could manufacture at a profit. In June 1863, a 'Public Works Act' was passed, to enable the government to advance £1,200,000 for public works in the cotton districts—partly to make good drainage, roads, water-supply, &c., and partly to yield £600,000 or £700,000 as wages to the unemployed cotton-hands in doing so much of the work as they could manage. The money (to be repaid by parish rates at subsequent dates) was to be advanced by the Exchequer Loan Commissioners on the recommendation of the Poor-law Board, and a government engineer was to examine and sanction the several works to be executed. All these operations were to be confined strictly to the cotton districts, where the distress existed. Mr R. A. Arnold, the resident government inspector of these public works, states in his *History of the Cotton Famine*, that by the month of June 1865, there had been works planned, and in great part executed, under the clauses of this and a supplementary bill, to the amount of £1,846,000. They comprised the making or improving of 276 miles of street and highway, 304 miles of main sewer, reservoirs for 1500 million gallons of water, several parks and cemeteries, and a large area of land-drainage. Nearly 30,000 persons had been fed by the wages of the cotton operatives on these works. The subscriptions to meet the distress reached the vast sum of £2,000,000;

while the out-door poor relief was about £1,000,000 more than in an equal period of average times.

The fluctuations in the value and quantity of cotton available during this extraordinary period are strikingly shewn in the following parallel columns, relating to the raw cotton imported, and the money paid for it:

| | Quantities (Cwts.). | Value. |
|-----------------|---------------------|-------------|
| 1860, | 12,410,000 | £35,757,000 |
| 1861, | 11,223,000 | 28,553,000 |
| 1862, | 4,673,000 | 31,093,000 |
| 1863, | 5,973,000 | 56,375,000 |
| 1864, | 7,976,000 | 75,204,000 |
| 1865, | 8,732,000 | 66,032,000 |
| 1866, | 12,396,000 | 77,521,000 |

Remark here the sudden and tremendous increase in the amount paid for cotton in the latter half of the period; the payment, indeed, of forty millions sterling more in 1866 than in 1860, for about the same quantity. To shew how India and Egypt benefited by this unprecedented state of affairs, we give (in pounds,* not cwts.) the quantities imported from those countries as compared with the imports from the United States:

| | United States. | India. | Egypt. |
|-----------------|----------------|-------------|-------------|
| 1860, | 1,119,000,000 | 204,000,000 | 43,000,000 |
| 1861, | 816,000,000 | 369,000,000 | 41,600,000 |
| 1862, | 13,524,000 | 393,000,000 | 50,000,000 |
| 1863, | 6,394,000 | 434,000,000 | 94,000,000 |
| 1864, | 14,148,000 | 507,000,000 | 125,000,000 |
| 1865, | 139,000,000 | 446,000,000 | 177,000,000 |
| 1866, | 580,000,000 | 615,000,000 | 118,000,000 |

Look, again, at the prices per cwt. : *

| | United States. | India. | Egypt. |
|-----------------|----------------|---------|---------|
| 1860, | 3 0 4 | 1 17 0 | 2 15 6 |
| 1861, | 3 12 5 | 2 17 5 | 4 4 9 |
| 1862, | 10 2 4 | 6 5 9 | 7 1 4 |
| 1863, | 11 5 8 | 8 18 11 | 10 11 8 |
| 1864, | 13 11 0 | 8 9 0 | 12 15 3 |
| 1865, | 9 18 6 | 6 5 7 | 8 16 1 |

British India certainly ought to shew beneficial results from the fact that, whereas the exported cotton in 1860 brought only £2,500,000, in 1864 it brought £34,000,000, and about as much in 1865.

COVINGTON, a city of Kentucky, U. S., on the south bank of the Ohio River, and west of the mouth of Licking River, opposite Cincinnati, with which it is connected by a lofty suspension-bridge and steam-ferris. It has a city hall, ten churches, the Western Theological College, a Roman Catholic cathedral, and manufactories of cotton, hemp, silk, tobacco, and iron. There is also an extensive establishment for packing pork and beef. Pop. (1860) 16,471.

CRAB, ROCKR, a singular sectary of the English Revolution, had served for seven years in the Parliamentary army, and though he had his 'skull cloven' by a royalist trooper, yet, for some breach of discipline, Cromwell sentenced him to death, a punishment subsequently commuted to two years' imprisonment. After his release from jail, C. set up in business as 'a haberdasher of hats' at Chesham, in Buckinghamshire. His wandering mind, probably not improved by the skull-cleaving operation, then

* The Board of Trade Tables, from which these figures are taken, are often difficult to consult, on account of the quantities of cotton being stated sometimes in *bales*, sometimes in *cwts.*, and sometimes in *pounds*.

imbibed the idea, that it was sinful to eat any kind of animal food, or to drink anything stronger than water. Determined to follow, literally, the injunctions given to the young man in the gospel, he sold off his stock in trade, distributing the proceeds among the poor, and took up his residence in a hut, situated on a rood of ground near Ickenham, where for some time he lived on the small sum of three-farthings a week. His food consisted of bran, dock-leaves, mallows, and grass; and how it agreed with him we learn from a rare pamphlet, principally written by himself, entitled *The English Hermit, or the Wonder of the Age*. 'Instead of strong drinks and wines,' says the eccentric Roger, 'I give the old man a cup of water; and instead of roast mutton and rabbit, and other dainty dishes, I give him broth thickened with bran, and pudding made with bran and turnip-leaves chopped together, at which the old man (meaning my body) being moved, would know what he had done, that I used him so hardly. Then I shewed him his transgressions, and so the wars began. The law of the old man in my fleshly members rebelled against the law of my mind, and had a shrewd skirmish; but the mind, being well enlightened, held it so that the old man grew sick and weak with the flux, like to fall to the dust. But the wonderful love of God, well pleased with the battle, raised him up again, and filled him full of love, peace, and content of mind, and he is now become more humble, for now he will eat dock-leaves, mallows, or grass.'

The persecutions the poor man inflicted on himself, caused him to be persecuted by others. Though he states that he was neither a Quaker, a Shaker, nor a Ranter, he was cudgelled and put in the stocks; the wretched sackcloth frock he wore was torn from his back, and he was mercilessly whipped. He was four times arrested on suspicion of being a wizard, and he was sent from prison to prison; yet still he would persist in his course of life, not hesitating to term all those whose opinion differed from his by the most opprobrious names. He published another pamphlet, entitled *Dagon's Downfall, or the great Idol digged up Root and Branch; the English Hermit's Spade at the Ground and Root of Idolatry*. This work shews that the man was simply insane. We last hear of him residing in Bethnal Green. He died on the 11th of September 1690, and was buried in Stepney Churchyard.—*Chambers's Book of Days*, vol. ii. p. 334.

CREUZOT, L^a, a town of France, dep. of Saonet-Loire, 12 miles south-south-east of Autun. It is situated in the midst of a district rich in coal and iron, and possesses large iron-foundries, which turn out cannon, anchors, steam-machinery, &c., and which employ 7000 workmen. A short railway connects the town with the Canal du Centre, which traverses the coal-field. There is also a glass manufactory, one of the most important in France. C. has of late increased rapidly in size and importance. The pop., which in 1841 was 4000, in 1866 had reached 22,688.

CROQUET, an open-air game, in which two or more players endeavour to drive wooden balls, by means of long-handled mallets, through a series of arches set in the ground according to some pattern. The player who first makes the complete circle of the hoops or arches wins the match; but during the progress of the game, each player may have the progress of his ball retarded by his adversaries, or assisted by his allies;—and these friendly aids and hostile attacks constitute the chief interest of croquet. Although generally spoken of as a modern game,

it seems to be really a revival with modifications of the sport with a mallet and ball which was popular in England in the days of the Stewarts, and gave the name Pall Mall to localities in various towns in England as well as on the continent (see BALL). The name (It. *palla*, a ball, and *maglio*, a mallet; Fr. *palemaille*) suggests an Italian origin; but the game was early in vogue in France, and thence passed into England, probably in the beginning of the 17th century. Blount's *Glossographia* describes the game as quoted in the article BALL, and gives figures of the mallets, which are here reproduced. This game seems to have gone out of fashion early in the 18th century. Who resuscitated it in its modern form, and how it got the name of croquet, are questions that have not been answered; but since 1850 it has been growing in popularity, and is now the most prevalent of all summer amusements. One advantage of the game, and the chief ground, perhaps, of its popularity, is, that it is one of the few out-door amusements in which the two sexes can join on equal terms.

A *croquet-ground* should be a well-rolled level grass plat or lawn, not less than thirty yards long by twenty yards wide; nor, for play upon the grandest scale, more than a hundred yards by sixty. The boundaries of the ground should be well defined, either by a raised walk or a trench. The game may be very well played on an ordinary cricket-field, or in an enclosed meadow. Indeed, the grass plats in the squares of large towns have of late been very generally appropriated to croquet. Croquet can also be played upon a well-rolled gravel-ground, or upon the sea-shore, where the sands are hard and dry. Hardness is essential, so as to prevent the ball from sinking into the ground while making the 'croquet.'

THE IMPLEMENTS used in croquet are mallets, balls, posts (or sticks), and hoops (which are called indifferently hoops, wires, or arches). To these are sometimes added a cage, or a pair of tunnels; or hoops, tunnels, and cage may be all employed in the same game. The progress of each player may be marked with either clips or a marking-board.

The Mallets should be light and handy; with ash shafts, and boxwood or ash heads. The heads of the mallets are of various shapes—as the dice-box,

Mallets used in the old game of Pall-mall.

Mallets used in Croquet.

which is the most common shape; the plano-convex, the hammer-head, and the cue-shape. The last, which has only lately come into use, has a flat end and a pointed end; the latter, like a billiard-cue, being tipped with leather. The head of the mallet should be from four inches to four and three-quarters in length, by not more than two

CROQUET.

inches and three-eighths at its greatest diameter, so that the centre of the mallet-head should correspond to the centre of the ball. The handle or shaft should be from two feet nine inches to three feet in length. Next the head there should be a ring of paint, corresponding in colour to the player's ball, and the series of colours on the starting and turning posts.

The Balls are made of box or beech, thoroughly well turned and seasoned. Boxwood is generally preferred, but there has lately been introduced a ball composed of cocoa-nut fibre and india-rubber, which is very pleasant to play with. These balls are perfectly round, are made of the correct size and weight, and are known as 'Nicholson's Patent Compound Croquet Balls.' The proper size of the balls is three inches and a half in diameter. Where wooden balls are employed, they should be kept rubbed with linseed-oil when out of play.

A full set of croquet balls consists of eight, severally painted, in whole or in part, blue, pink, black, yellow, brown, orange, green, and red, so as to determine the order of play.

The Post.

painted white, and are either round or flat at the top; and when set, should stand about 15 inches

Hoops.

out of the ground. When ten hoops form the 'set,' eight of them should be marked with a ring of colour like the balls, and two left entirely white. By having the hoops painted white or galvanised, they are easily distinguished in an imperfect light.

The Tunnels are made of wood or iron, smaller than the hoops, with flat sides. When used, the player is sometimes restricted to one way of running them. They merely add to the difficulties of the game, and are not very popular or essential.

The Cage consists of an additional pair of white hoops placed crosswise in the ground, either with or without a suspended bell at their junction.

Clips or discs of tin, marked with the several colours, are sometimes used to mark the game by being hung on the hoops as each player passes

Tunnel.

The Cage.

through; but many players do without the clips altogether. In the place of the clips, a *marking-board*, the same in principle as the pool-board in billiards, is now often used.

Terms used in the Game.

In croquet, as in other games, there are various terms employed, which, to the uninitiated, often sound strange and meaningless. We mention the most indispensable.

Roquet (pronounced *rokey*).—The word is used to denote that when both balls are 'in play,' the player's ball hits or strikes another ball. The making a roquet gives the player the privilege of croqueing (pronounced *krokaying*) the ball struck. The roquet can only be made once in each turn upon the same ball. A second roquet, without a point in the interval, does not count; but it may be made for the purpose of driving away an opponent's ball, *cannoning*, &c.; the player's turn ending there, unless by the same stroke he make a point, or roquets another ball, which he has not previously struck during the round, and since making a point.

Croquet.—When one ball has roqueted another, the

Taking the Croquet.

player sets his foot on his own ball, and with a blow of the mallet, drives the ball in contact with his own in any direction. The croquet may be either

CROQUET.

'tight,' 'loose,' or 'rolling.' The heel of the player either rests on the ground, with the front of the foot on the ball, or the middle of the foot or toe presses on the ball. The first plan is the best, as, if the ball move from under the foot, there is no jar or fall.

A *Tight Croquet* is made by the player placing his ball close to the one he has roqueted, then fixing his ball in position with his foot, he strikes it with his mallet, and drives the other ball away. But if the player's ball slip from under his foot, the stroke following the croquet is forfeited.

A *Loose Croquet* is made in three ways: first, by the player placing his ball close to the one he has roqueted, and striking the former, in a line passing through the axis of each—by which plan the player's ball remains stationary while the other flies forward; secondly, by the player striking the ball at any angle, so as to drive the balls in opposite directions. This is called a 'splitting croquet.' And lastly, by touching the roqueted ball slightly, with as little movement in the player's ball as need be. This last stroke is called 'taking two turns off' the roqueted ball. In any case, the latter must be sufficiently moved to satisfy the umpire as to the fairness of the stroke.

A *Rolling Croquet* is made by placing the two balls in juxtaposition as before, and the player striking his own ball in such a way as to make it follow after the ball struck. This is also called a 'following stroke,' and is made by striking your ball high; while in a *tight croquet*, you hit your ball below its centre, and with a sudden drawback motion of the hand, as in making the screw in billiards. Either croquet may be made with one hand, or with both hands, and with the foot upon your ball, or without it. Considerable judgment is required to make the croquet in such a way as to assist your own game and encumber that of your opponent by one and the same stroke.

The Side Stroke.

The *Side Stroke* is made by raising the mallet to the shoulder, and hitting your ball full in the centre.

The *Straight Stroke* is made with the mallet held

straight to the axis of the ball, perpendicularly in front of the body.

Spooning is simply pushing the ball, which is considered unfair. The test of a spoon is that it makes no noise. The umpire must decide, on being appealed to, whether the ball is a *spoon* or a *tap*.

When a ball has been roqueted, the player takes up his own ball, and places it close to the roqueted ball. He then makes his croquet as above described.

In Play.—A ball is said to be 'in play' as soon as it has run the first hoop; and it remains in play till it makes a roquet, when it is

In Hand.—The ball being 'in hand,' cannot score till it has made a croquet, after which it is again 'in play;' but unless it makes a point, it continues 'in hand' to the ball or balls it has croqueted for the remainder of its turn. When it has made another point, it is 'in play' again to all the balls, as at the beginning of its turn.

Dead Ball.—A ball is said to be 'dead' when it has run all the hoops 'in order,' and has struck the winning-post.

In Order.—This term is used to signify the hoops, tunnels, cages, posts, &c., in their regular order of play, according to the plan or arrangement adopted in placing them in the ground. When a player has made the complete round of the hoops in their proper sequence, he is said to have made his 'tour' or 'round' of play. The game is won by the side or player succeeding in first driving the balls through the hoops, in order, to the turning-post, and then back again to the winning-post.

The *Starting and Winning Post* is the stake from which the play in the game proceeds. The *Turning-post* is the stake placed at the other extremity of the hoops, directly opposite the starting-post; and round which the player must strike his ball before he makes the return-route.

To *Dismiss* a ball, is to strike it to a distance. *Running a Hoop* is when a ball is struck fairly through the hoop next in order of play. *Rueing a Hoop* is the failure of a ball to reach the hoop aimed at. The player who misses his first hoop is by some players known as a *booby*. *Ricochet* is the striking of the player's ball against two balls in succession. This stroke, which is sometimes called the double roquet, is precisely similar to the cannon in billiards. A *Wired Ball* is one which cannot be croqueted, by reason of the leg of the hoop intervening. A *Rover* is a player who has made the complete tour of the hoops, 'in order,' and elects to remain in the game to assist his side and encumber their adversaries. *Roquet-croquet*.—This term is sometimes applied to a croquet made without the foot of the player being placed on his ball.

The Points of the Game.

The points reckoned are—1. Running a hoop; 2. Running a tunnel or cage; 3. Striking the winning-post: each in the regular order of play.

1. A hoop is said to be 'run' when a ball has fairly passed through it while in play. A ball is considered to have 'passed its hoop' if it cannot be touched by a straight stick—as the handle of a mallet—laid on the ground parallel to the hoop on the side whence the player struck.

2. In running a tunnel, the ball must pass completely through; and in running a cage, the same test may be applied as for the hoop. Where a ball is suspended—as in the Eglinton Game—it must be rung before the point can be scored by the player.

3. The winning-post must be fairly hit, so that

the blow may be heard, or the post be seen to be moved from its position.

Any hoop, tunnel, cage, or post, moved from its perpendicular by a blow from a ball or mallet, is to be set straight by the captain or umpire.

The player is not compelled to play for a roquet or point. It is sometimes better play for him to strike his ball towards a particular spot, so that on his turn coming round he may make his hoop the more easily. But, of course, he is liable to be roqued by a succeeding player.

The order of the colours on the posts, and consequently the succession of the players, is not arbitrary; it may be arranged in any way chosen by the players; but the plan here given is that which is usually adopted.

The Game.

The game of croquet may be played by any number of players not exceeding eight—four on each side. It is common, indeed, when two players engage in a match, for each to have two balls. In the opinion of many, croquet is best played by two or three players on each side. The hoops being set according to one of the plans following, or in any other way decided on by the players, the game commences by the choosing of 'sides.' The players, for distinction's sake, take balls and mallets of opposite colours—those on one side choosing, say, blue, black, brown, or green; those on the other the light balls—pink, yellow, orange, or red. This done, the players address one another as pink, brown, &c., according to the colour of their balls.

The player whose ball is nearest the top of the post—according to any succession of colours that may be adopted or determined on—starts from a mallet's length of the *starting-post*, and endeavours to strike his ball through the first hoop. If he fail in 'running his hoop,' he must wait till his turn comes round again; his ball, meanwhile, remaining on the ground to be struck (roqued) or croqued by any of the succeeding players. If, however, the player succeed in making his first hoop, he goes on to strike his ball through the second hoop, and so on till he fail; which, from the peculiar angles or lines of direction between the hoops, he will probably do at his third hoop. The other colours then play in their order. It is unnecessary to follow all their strokes; but let us suppose that orange, whom we will make a lady, is just passing through her second hoop, blue, pink, black, yellow, and brown, lying in various positions in the neighbourhood of the third and fourth hoops, one or other of which they are severally desirous of threading. Orange, having passed her ball through a hoop, is entitled to another hit. Carefully calculating her distance, she strikes her partner, yellow, gently, just impelling that ball towards the mouth of the hoop through which yellow has to pass. The same stroke brought orange nearly below the third hoop, which a long stroke would enable it to pass. Like passing a hoop, striking another ball—friend or foe—gives another turn; consequently, orange has a choice before her. She may aim for the third hoop, and, as she is a good player, probably passes it; but the distance is considerable, and any pebble or slight irregularity in the ground may cause her ball to diverge from the direction in which it was struck. On the other hand, as there are several balls in her vicinity, she prefers to work her way to the hoop by successive strokes among her neighbours, distributing favours as she goes. Blue, an enemy, lies nearest, still anxious for his third hoop. A gentle tap with the mallet brings orange against him. This entitles her either to another free stroke or to a croquet. She chooses the latter, and to perform

it, selects a spot as unfavourable as possible for blue. The turning-post seems suitable; she lifts her ball, places it at the side of blue farthest from the turning-post, firmly plants the ball of her left foot on her own ball, and bringing down the mallet with a sharp stroke upon her own ball, while she holds it firm with her foot, sends her azure enemy flying over the lawn in the direction of the turning-post, and even beyond it. Having croqued, she is entitled to another turn. She similarly croques pink; but pink being a friend, she croques him through his hoop and well up for his fourth hoop. Black escapes orange's attention, and she, after croqueing pink, passes the hoop herself, by so doing acquiring another turn; and as she has passed a hoop between, she may again aid yellow or pink, or pass on to her other hoops herself, as she pleases. With the aid thus obtained from other balls, a good player may sometimes pass the whole round of hoops without being once stopped. There is also what is called 'taking a stroke off' another ball. This consists in first hitting it, as if to make a croquet, and then placing your own ball by it, to strike your ball in the direction you wish to take, merely touching the other ball as you go. The touch is essential, or the player forfeits the right to play again.

When a player has passed all the hoops on the one side, he makes his way round the turning-post, and proceeds to run the hoops on the other side, in the contrary direction, but with the same restrictions and methods as before. Having passed through the last hoop, he may proceed to strike the starting-post, which is also the winning-post. By doing so, he is out, or 'dead,' and of course can play no more. If, however, he be a good player, he may considerably benefit his friends and annoy his enemies by becoming a 'Rover,' and travelling about from hoop to hoop aiding his partners against their foes. Of course, if a Rover be a clever player, the opposite side will do their best to strike his ball against the winning-post, and so stop his further ravages. On the other hand, if he be an awkward croquet, it is best to let him live, as his side cannot win, though all his partners be out, so long as he can be kept afield.

This description, with the aid of the Rules and Definitions of Terms, will, we fancy, enable anybody to play croquet without much trouble.

Each side should choose a captain or leader to conduct the game; and it is also well that an umpire, who thoroughly understands the theory and laws of croquet, should be selected to decide disputed points.

The Arrangement of the Hoops.

Various plans for the placing of the hoops have been adopted by croquet players; but the general principles of the game are the same in all cases, whatever the shape of the ground or the disposition of the arches. The following is the original plan, and the easiest way of setting out the hoops; and a clever player may make the entire round without stopping.

To set out the hoops in this fashion, drive in the starting-post (which is also the winning-post), and set the first hoop in a straight line from it at a distance of 12 feet. Set the second hoop 10 feet farther on; then draw a diagonal line of 20 feet, and set up the third hoop, with the fourth hoop 10 feet distant in a straight line, and the fifth hoop 10 feet farther. Then draw another diagonal of 20 feet, and set up the sixth hoop immediately opposite the second; carry the seventh hoop 10 feet back in a straight line, and fix the turning-post 12 feet back, to correspond with the starting-post. Afterwards, complete the other side in precisely the same

CROQUET.

way. Thus, the order of play will be from the starting-post to hoop 1, and so on to the turning-post, and thence back to the winning-post. The perfect lines shew the onward march of the balls, and the dotted lines their return. This arrangement is carried through all the diagrams here given.

Starting and Winning Post.

The Original Plan for Ten Hoops.

Of course, the distance from hoop to hoop must be greatly governed by the space of the ground; but the proportions here indicated should be generally observed. A tape or line marked in feet or yards will be found of great assistance in setting out the hoops.

In the following plan, the players will find a little more variety and difficulty. Nine hoops only are employed, and instead of the centre hoop, there may be a cage either with or without a ball. Care must be taken to place the hoops in directly corresponding situations on either side, with the starting and turning posts at equal distances from the first and last hoop at each end. The colours of the hoops should correspond with the order of the colours on the posts—blue, pink, black, &c.—with the middle hoop or cage white. Sometimes a post is set up in the centre instead of a hoop or cage. In this latter case, the post must be struck with the ball. Various modifications of this plan will suggest themselves to clever players.

Sometimes ten hoops are placed in a circle, with a cage in the middle, which arrangement makes the game rather more difficult; sometimes two extra posts are added; in fact, the variety of figures which may be improvised by an ingenious captain

is almost endless. But whatever the number of hoops, posts, &c., and whatever the arrangement

Arrangement for Nine Hoops, or Eight Hoops and a Cage or Post.

adopted, the main elements of the game are the same.

Laws of Croquet.

In the following rules, we adopt the principal conclusions arrived at by a committee of players selected by the editor of *The Field*, the *Country Gentleman's Newspaper*, a great authority upon all points connected with out-door sports and amusements.

I. The order in which the players follow each other is to be decided by lot.

II. Each player commences by placing his ball on the ground, and striking it through the first hoop, from any place not more than a mallet's length from the starting-post.

III. If the player miss making his first point, his ball is taken up, and remains in hand till its turn of play comes round again.

IV. The player who makes his first hoop, goes on as long as he can do so 'in order.'

V. Any player roqueing a ball, must croquet it before he plays for his next hoop.

VI. If a player roquet a rover against the winning-post, he cannot take croquet, as the ball is 'dead;' he therefore loses his next stroke.

VII. A ball 'in play,' driven through its proper hoop, or cage, or hitting a post, 'in order,' by any stroke, whether by a ball on his own side or by an antagonist, counts that hoop, cage, or post.

VIII. If a ball, after roqueing another, run a hoop

CROQUET—CSERVENKA.

or cage, hit a post, or make another roquet, before it has taken its croquet, it is considered to be in hand, and cannot mark the point.

IX. If a ball, while passing through a hoop, roquets another, the croquet must be taken, and the hoop does not count.

X. A ball which rests under a hoop shall not be considered to have passed that hoop if a straight edge laid against the front legs of the hoop touch the ball.

XI. All strokes must be made by the player standing on one side of his ball, except in games in which it shall be mutually agreed to use the side stroke or the straight stroke indifferently.

XII. Either one hand or both hands may be used in striking the ball, but no player shall be allowed to grasp his mallet at less than fifteen inches from its head.

XIII. All strokes must be made with the *end* and not with the *side* of the mallet. But either end of the mallet may be used. When a ball is struck with the side of the mallet-head, the stroke is to be forfeited, and any balls moved are to be replaced to the satisfaction of the captains.

XIV. The player who finds another ball touching his own, may strike the latter as sharply as he pleases, and afterwards—being in hand—take the croquet off it.

XV. A rover may roquet and croquet any ball belonging to either his partner or antagonists; but he is allowed to do so only once during each turn, when he then takes another stroke after each croquet.

XVI. The rover may be roquet and croquet by any ball in play; and if it be struck against the winning-post, it is dead, and must be taken up from the ground.

XVII. When a ball is struck beyond the limits of the ground, it must be immediately replaced within half a mallet's length of the edge of the ground, measured from the spot where it went off, at right angles to the margin.

XVIII. Where clips are used, it is the business of the captain on each side to place them on their proper hoops; but where clips are not in use, each player must remember his hoop next in order. In cases of doubt, the player may inquire of the captain on the other side as to his proper hoop 'in order.'

XIX. The game is won by all the players on one or other side making the complete round of the hoops, in order, and striking the winning-post: the side which first succeeds in doing this, wins.

XX. The umpire shall decide all cases of dispute, on being appealed to, and his decision shall be final.

XXI. *Penalties.*—1. If in making a tight croquet, the player allow the ball to slip from under the foot, he loses his next stroke, and must allow his ball to remain where it rolls.

2. If in 'taking two turns' off a ball, the player fail to move it, he loses his next stroke.

3. If a player touch or stop any ball that is in play and rolling with hand, foot, dress, or mallet, or in any way obstruct its progress, he loses his turn for that round; but if either of these acts be done by a player on the other side, the owner of the ball may either take the stroke over again, or allow his ball to remain where it was moved, and proceed with the game.

4. If, in taking aim, the player strike the wrong ball, the latter must be replaced to the satisfaction of the captain (or umpire), and the player loses his turn.

5. If a player, from any cause, strike a ball a second time, he loses his turn, and forfeits his stroke; and the ball so improperly hit must be replaced, to the satisfaction of the captain on the other side.

6. Any player going on out of his turn, loses any and all points he has made, provided the error be discovered *before* the next player makes his stroke. The ball or balls so struck are to be replaced or allowed to remain where they are struck, at the option of the captain on the other side. But if the mistake be discovered *after* the next player has made a stroke, then the ball played in error must stand.

7. The player loses all benefit from his stroke if he play with a wrong ball, or croquets a ball to which he is not entitled to play. In such a case, the player's turn is lost, and the ball or balls must be replaced. But if a second stroke be made before the error be discovered, no penalty can be exacted, and the player proceeds as though he had made no mistake. But if, in the opinion of the umpire, on being appealed to, a wrong ball was wilfully played with, or a wrong ball wilfully croqueted, the player loses his turn, and the balls must be replaced or allowed to remain as they are, at the option of the opposite captain.

8. The player who pushes or spoons a ball loses his turn and all points he may have made by the stroke, and the balls must be replaced to the satisfaction of the adverse captain (or umpire), or allowed to remain where they roll.

9. If the player, in taking aim, move a ball more than the length of a mallet's head, he must be considered to have made his stroke; but if his ball be moved less than that distance, he may make his stroke over again. The decision as to distance to be determined by the umpire, on being appealed to.

PARLOUR CROQUET.

During winter evenings, or in wet weather, the lovers of croquet may play at the game within doors, either in a large play-room or on a table. Sets of implements for various parlour and table games akin to the croquet of the lawn, are now produced by various makers. The hoops for parlour croquet are set on feet, so that they will stand

The Croquet Stand.

straight and firm. All the rules of ordinary croquet are observed; while for the other games, rules are given with each set of implements.

CSERVENKA, a town of Hungary, in the county of Upper Bacs, on the Franzens Canal, about 130 miles south of Pesth. Pop., which is German, 6682.

CULLERA, a fortified maritime town of Spain, on the Mediterranean, at the mouth of the Jucar, in the province, and 23 miles south-south-east of the town, of Valencia. C. is irregularly built, but clean; has an old castle, several churches, schools, convents, a hospital, extensive barracks, &c. From its position, it is considered a place of great military importance. It stands on the outskirts of an agricultural district, 'an Eden of fertility,' and the inhabitants are mostly engaged in agriculture, cattle-rearing, fishing, and the production of oil and wine. A considerable coasting-trade is carried on with France and the Mediterranean. Pop. 7821.

CULNA, a town of India, in the British district of Burdwan, presidency of Bengal, 47 miles north of Calcutta, on the right bank of the Hooghly. The town contains a vast number of temples, is a station of the Free Church (Scotland) Mission, and has a flourishing English school. It is a place of considerable trade, rice, grain, silk, and cotton being the chief articles of commerce; and of late years, the traffic has greatly increased, in consequence of its being found a convenient station for steamers plying between Calcutta and the upper provinces. C. is said to have 60,000 inhabitants, the chief part of whom are from different parts of the country carrying on trade here.

CUMBERLAND, a township of Rhode Island, U. S., on Blackstone River, and Providence and Worcester Railway, 10 miles north of Providence, containing extensive manufactories of iron, machinery, cotton, boots and shoes, &c. Pop. (1860) 8339.

CUMBERLAND, a city of Maryland, U. S., on the left bank of the Potomac River, at the foot of the Alleghenies, the eastern terminus of the National Road, and the western of the Chesapeake and Ohio Canal, 179 miles west-by-north from Baltimore. C. is a station on the Baltimore and Ohio Railway. It contains county buildings, 8 churches, 3 newspapers, flour-mills, &c. The C. semi-bituminous coal is supplied from this region. Pop. (1860) 8478.

CURTIUS, ERNEST, a distinguished German philologist and antiquary, born September 2, 1814, at Lübeck. After a good preliminary education at the High School of that place, he attended several German universities (Bonn, Göttingen, and Berlin) as a student of philology. In further pursuance of the path he had chosen—viz., the investigation of Greek antiquity—he went (1837), in company with Professor Brandis, to Athens, where he stayed several years. When his teacher, O. Müller (q. v.), came to Athens, C. accompanied him in his travels through Greece. On the death of Müller at Athens, in 1840, C. returned to Germany, visiting many places in Italy by the way. He graduated in Halle, and after he had taught for some time at two Berlin gymnasiums, he received an extraordinary professorship at the university of that place. His *Anecdota Delphica*, *Inscriptiones Atticæ Duodecim*, and *The*

Akropolis of Athens, were published about this time. In 1844, he was called to the honourable position of tutor to the present Crown-prince of Prussia. Six years later, he returned to his academical office, until, in 1856, he accepted a call to Göttingen, as Professor of Classical Philology. One of his principal works is *Peloponnesos*, a description of the country of Greece with reference to its traditions, history, and monuments. In his *Attic Studies*, he has begun to publish the results of a second journey to Greece in 1862.

CURTIUS, GEORG, a distinguished classical scholar, the brother of the former, who has acquired a high reputation for the light he has thrown on the Greek and Latin languages, by applying to them the comparative method. Born April 16, 1820, at Lübeck, he studied at Berlin and Bonn. After a short activity at Berlin, and a longer stay at Prague and Kiel universities, he accepted (1862) the Professorship of Classical Philology at Leipzig. Of his published works are to be noted, *De Nominum Græcorum Formatione* (Berl. 1842); *Die Sprachvergleichung in ihrer Verhältnisse zur Classischen Philologie* (Dresd. 1845); *Sprachvergleichende Beiträge zur Gr. und Lat. Gram.* (Berl. 1846); *De Nomine Homeri* (Kiel, 1855). His *Griech. Grammatic* (2d ed., Prague, 1855) is in high repute, and his *Grundzüge der Griech. Etymologie* (Leip. 1862) is a most valuable contribution to that department of philology.

CURUKU OIL, or **BRAHMADUNDU OIL**, a pale yellow, limpid oil, obtained in large quantities in India from the seeds of the *Argemone* (q. v.) *Mexicana*, or Prickly Poppy, a plant accidentally introduced, but which now flourishes luxuriantly in all parts of India. It is used for lamps, and for other purposes, but possesses properties which render it unfit for food.

CUTTEAMUNDU, the juice of the *Euphorbia Cullimundu*, a species of Spurge (q. v.), a native of India, particularly of the Northern Circars. It is used for cementing iron with other substances, as for uniting the blade and handle of a knife. The fresh juice is used as a vesicant. In a dried state, it is capable of being moulded into any form, and a great variety of articles may be made of it, as of gutta percha. A medal was awarded to Mr Elliot at the London Exhibition of 1851, for the introduction of this interesting substance to notice.

CYBIUM, a genus of fishes of the family *Scomberidae* (q. v.), having a long first dorsal, detached finlets, an elongated body, a keeled tail, no pectoral cuirass, and no armature on the lateral line, compressed trechant teeth in the jaws, and very numerous villiform teeth in other parts of the mouth. A number of species are natives of the seas of the East Indies, some of which are much esteemed for the table; and one species, *C. Commer-soni*, is used in a dried as well as in a fresh state; and in a dried state is, to some extent, an article of commerce in India.

D

DAËT, a town of the island of Luzon, Philippines, situated on a river of the same name, which falls into the Bay of San Miguel on the eastern side of the island. Some of the houses are built of stone and some of nipa palm. Pop. 7702.

DA'LIAS, a town of Andalusia, Spain, in the province of Almeria, and 18 miles west-south-west from Almeria, about nine miles from the Mediterranean, on a small river, which is navigable for boats up to the town. The immediate neighbourhood is a dreary sandy plain; but not far off are mountains containing lead and antimony mines, which afford employment to many of the inhabitants of the town. Husbandry and fishing are the other principal occupations. The streets are mostly irregular, and the town is ill built. It suffered considerably from an earthquake in 1804. Near D., on the sea-side, are mineral baths, much frequented. Pop. 9000.

DALBY, a town of Ayrshire, Scotland, on the Garnock, near the mouth of the Rye, 20 miles south-west of Glasgow; it is a station on the Glasgow and South-western Railway. The vale of the Garnock is naturally beautiful and fertile; but its mineral wealth in coal, lime, and iron has recently caused a great change in its aspect, and it is much disfigured by blast-furnaces, &c., and by vast heaps of refuse from mines. D. was recently a small village, but has of late rapidly increased in population and importance in consequence of the establishment of iron-works at and near it. D. possesses also a large woollen mill, which gives employment to upwards of 400 hands. Pop. (1851) 2706; (1861) 4232; (1867) about 5000. It is feared that the increase in population and prosperity will not long continue, as the ironstone is being rapidly exhausted.

DALTON, a town of Furness, Lancashire, England, on a gentle acclivity, about three miles and a half from the sea, and 18 miles west-north-west from Lancaster. It is connected by railway with the railway-system in Lancashire on the one hand, and with that of Cumberland on the other. There are iron mines and foundries in the vicinity, and malting is carried on, but not to so great an extent as formerly. Near the town are the ruins of Furness Abbey, founded in 1127 by Stephen, Count of Boulogne, and afterwards king of England, for monks of the Cistercian Order. Pop. (in 1861) 3200.

DARAGUNJ, a town of India, in the British district of Allahabad (q. v.), on the left bank of the Ganges, opposite to Allahabad, with which it is connected by a ferry. The bed of the Ganges is here about a mile wide, two-thirds of the width being occupied in the dry season with wet sand and mud, over which the passage is difficult. Pop. 9103.

DARJEEFLING, a sanitary station of British India, in a district of the same name, in the Sikkim Himalaya. It is situated at an elevation of 7400 feet above the sea, on the side of a great hollow or basin, in which flows the Bunjeet, a branch of the Teesta. Forest-covered mountains rise above it, where the rhododendrons of the Himalaya grow in great luxuriance. It commands a magnificent view of the snowy ranges of the Himalaya to the north and west. Notwithstanding frequent heavy rains, and a very great annual rainfall, the climate is very salubrious. D. is only about 36 miles from the plain of Bengal, and 308 miles north from Calcutta. It was obtained by the British government from the Rajah of Sikkim in 1835, in order to be made a sanitary station. A further portion of the territory of Sikkim was annexed to the district in 1850, in consequence of outrages committed by the rajah on British subjects. Tea culture has recently been introduced; and in 1862, there were 8762 acres under tea—the estimated produce being 78,224 lbs. of the first quality.

DAVENPORT, a city of Iowa, U. S., on the right bank of the Mississippi, at the foot of the upper rapids, and opposite Rock Island, Illinois, on the Great Western route from Chicago, is 330 miles above St. Louis. It is connected with Rock Island by a railway drawbridge across the Mississippi; contains 13 churches, 3 banks, Griswold College, cotton, woollen, and other manufactories. Coal is abundant, and a large trade is carried on by rail and river. The scenery is of the finest on the Northern Mississippi. Pop. in 1860, 11,267; 1865, about 17,000.

DAWLEY MAGNA, or **GREAT DAWLEY**, a town of the county of Salop, England, on the Severn Valley Railway. Pop. (1861) 6365.

DEAK, FRANZ, Hungarian politician, was born in 1803 at Kehida, in the Hungarian county of Zala. Having studied law at Raab, he began to practise as an advocate in his native county, and soon became noted for his eloquence and enlightened patriotism. Elected in 1832 to the national diet, he quickly placed himself at the head of the liberal opposition. Not less averse to all violent measures than inflexible in adherence to the constitutional rights of Hungary as an independent kingdom, he began that policy which he has undeviatingly pursued, of opposing, by legal and constitutional means, every attempt of the imperial government to infringe on these rights. This firm and moderate policy has enabled him to effect more than one reconciliation between Hungary and the Austrian emperor as her king—temporarily in 1840, and now (1867), it is to be hoped, more permanently. While upholding the independence of his country, he laboured for its internal improvement, promoting measures for the elevation of the peasantry, and advocating the abolition of the odious exemption from taxes enjoyed by the nobility. His views on this last point

displeased the party of the nobles, and for some years after 1840 his county did not return him to the diet. He still, however, continued to guide the councils of the moderate liberal party, and in spite of his aversion to extreme measures, he promoted the association for national defence, in the view of a possible struggle with Austria. After the revolution of March 1848, he became Minister of Justice in the cabinet of Count Batthyanyi (q. v.), and had formed the project of effecting a general reform in the administration of justice in Hungary, which, however, the war rendered impossible. D. used every effort to ward off the war, and come to an arrangement with Austria. On Kossuth's coming into power (September 17, 1848), D. resigned his portfolio, and retained only his place in the diet. In the last months of 1849, at the approach of Prince Windischgrätz, he proposed to sue for peace, and was one of the deputies sent for this purpose to the Austrian general. It is well known that that step failed, and that D. was even for some time a prisoner at Pesth; he then withdrew from public affairs, and retired to his estate. When the Hungarian revolution was suppressed, he refused the invitation sent him by M. de Schmerling, Minister of Justice at Vienna, to take part in the legislative conferences, as he disapproved of the policy followed by Austria with regard to Hungary. He did not return to public life till 1860, when a constitution was granted to his country.

On hearing of the arrest of Count Ladislas Téliki, D. set out for Vienna with M. Eötvös, and procured the release of his countryman, as well as the promise of an independent Hungarian ministry. Returned by the city of Pesth to the diet in 1861, he became in it the leader of the moderate party, at the same time that the extreme party collected round Count Téliki. The death of the latter (8th May) destroyed the only influence which could counterbalance that of D.; and the diet appointed him to draw up the address to the emperor. D. demanded, in that paper, the constitution of 1848, a Hungarian ministry resident in Pesth, the return, without restriction, of the exiles, and the restitution of their property. Rejected at first by the emperor, this address was again drawn up with some modifications in the details; the emperor answered it by a rescript which with difficulty dissimulated his repugnance to such an arrangement; and in his turn, D., in name of the diet, protested publicly against the imperial rescript. On the 23d, the emperor pronounced the dissolution of the Hungarian Diet, which did not separate without protesting anew, under the direction of D., against the illegality of the measure which dispersed them. Among the events consequent on the war between Austria and Prussia in 1866, has been the final triumph of D.'s policy in the establishment of that constitutional relation between Hungary and the Austrian crown for which he has all his life contended, and in the arrangement of which he has taken the leading part. See GERMANY in SUPPLEMENT.

DEBTS, RECOVERY OF. Courts of law, besides serving to decide cases in which questions of fact or law are really in dispute, serve an important purpose in facilitating the recovery of debts, against which the debtor has no defence other than that he is unable, or unwilling, to pay. The great majority of the cases in which the services of courts are required is of this kind. The statistics of the English county courts give a striking illustration of this. Of the number of cases which are entered for judgment, it appears that about 95 per cent. end in favour of the plaintiff; whereas, had there been any question really in dispute, the defendants, with the advantages they

possess, might have been expected to be at least as often right as the plaintiffs. The knowledge of this has had much to do with modifying judicial proceedings. Another cause which has operated in the same direction is, that the consequences of issuing a decree are now much less serious, as a creditor holding a judgment has not now the exorbitant powers over his debtor that he once had. The theory, accordingly, on which judicial proceedings are based, has very much changed. Formerly, lawyers thought that every case should come into court, prepared for being disputed on every point, and thus a great deal of expense was incurred before it was known whether there was to be any dispute at all. The end now in view is, that there should be a cheap means of obtaining judgment in undisputed causes; and that, at the same time, every precaution should be taken, that if the defender has any good ground of defence, he should have the opportunity of stating it; and that, when stated, it should receive due attention. Various law reforms have been carried to facilitate the recovery of debts with this end tacitly, at least, in view. In England, as might have been expected from the courts of law being situated in a great commercial capital, law reform has proceeded further in this direction than in Scotland; but in both countries, it has made great progress.

Understanding by debt the price of services rendered, or goods furnished, it may be useful to point out shortly the proceedings that must be taken to recover it. If the debt exceed £50 in amount, the creditor must, in England, proceed in one of the superior courts of law; and, in Scotland, he may proceed either before the superior court or before one of the sheriff-courts; but in any view, he must prepare for considerable expense—the services of professional advisers being in practice unavoidable—and for a more or less tedious litigation. If the debt do not exceed £50, the creditor may proceed in the English or Scotch county courts (in Scotland called the sheriff-courts), and the proceedings are simple and expeditious.

In England, the first step to recover a debt not exceeding £50 in the county court, is for the creditor to go to the registrar of the district within which the defender resides, or to the jurisdiction of which he is on some other ground amenable (30 and 31 Vict. c. 142*). He there fills up a printed form, called a plaint, shortly stating the claim and the ground of it. The registrar upon this issues a summons, and gives it to the bailiff of the court, who serves a copy of it on the defendant. This summons names a day on which the parties must appear before the judge. No written pleadings are in general necessary; but if the debtor has any special defence—such as, that he has a counter-claim against the plaintiff, or that he (the defendant) was a minor at the time the debt was contracted, or that he has been discharged under the bankruptcy acts—he must give the creditor notice in writing five days before the hearing. If he simply denies the debt, he has nothing to do but to attend the hearing, with what witnesses he may require. If the witnesses are not likely to come voluntarily, summonses to enforce their attendance (as well as the production of documents) may be obtained at the registrar's office. At the hearing, the judge (unless a jury have been required) proceeds himself in a summary way to try the cause. He examines the witnesses on oath, keeping no record of the evidence; and, on hearing the parties,

* This act contains a schedule enumerating the statutes regulating proceedings in the English county courts.

gives judgment at once. If he decides for the plaintiff, he may make the sum payable at once, or by instalments. The costs are according to a fixed scale, which may be seen in the court or in the registrar's office.

There are provisions for parties having their case tried by jury, and also for appeal on questions of law. Either party who wishes it, may ask for a jury; and if the sum claimed exceed £5, the demand must be complied with. If there be a jury, the number of jurymen is five, and their verdict must be unanimous. The party dissatisfied with the verdict may ask for a new trial, and the judge, if he thinks right, may grant it on such terms as he thinks reasonable. This power to try by jury is used very rarely indeed—less than one per cent. of all the cases which go to trial being tried in that manner. The right to appeal is against decisions in point of law, and against the admission and rejection of evidence. The appeal is to the superior courts of law at Westminster. It is taken by requiring the judge to state a case for the opinion of the higher court, and thereafter entering it for discussion there. The appellant must give security for the costs of the appeal, and (if defendant) for the amount (both of principal and costs) contained in the judgment. The right of appeal is not much exercised, and the parties have it in their power to agree beforehand (in writing) that there is to be none.

When judgment is for the creditor, and the order for payment is not complied with, execution may issue against the goods of the debtor. In certain cases, the debtor may also be imprisoned. The debtor is summoned to shew cause why he has not obeyed the judgment. At this hearing (whether the debtor attend or not), the creditor may get an order to commit, if he can shew to the judge's satisfaction that the debtor obtained credit on false pretences, or by fraud, or that he wilfully incurred the debt without a reasonable expectation of being able to pay it, or if he have made away with or concealed any of his property to defraud his creditors, or if he has had, since the judgment, sufficient means to pay it without defrauding other creditors, and has refused to do so. Imprisonment under these judges' orders is of very frequent occurrence, and—exceptionally in England—it has not the effect of extinguishing the debt. If the debt recovered (exclusive of costs) exceeds £20, and there are no goods, the judgment may be removed into a superior court, and there enforced by the same modes of execution as a judgment originally obtained there.

Although it is competent to proceed in the county courts for sums as large as £50, they are not much used for sums above £20. When the debt does not exceed £20, there is a certain compulsitor on the creditor to resort to the county court, for if he resort to a superior court, and recover no more than that sum, he will have no costs, unless he satisfies the court that he had sufficient reason for taking that course. In point of fact, there is only about one case for a sum exceeding £20, for a hundred which do not exceed it; and the average amount sued for is between £2 and £3.

In *Scotland*, debts not exceeding £12 may be recovered in the Sheriff Small-debt Court. The creditor takes two copies of his account to the office of the sheriff-clerk for the circuit in which the debtor lives; from him he obtains a summons, in which the day for the trial is fixed; and this summons he takes to an officer of the court (sheriff-officer), who serves a notice, with one of the copies of the account, on the debtor, at least six days before the trial. Both parties may employ an officer to cite such witnesses as they require. The creditor must appear at the trial, either by himself or by one of

his family, or by such other person as the sheriff may permit. Law-agents require special permission to appear, unless where both parties consent. If the defender intend to plead a counter-claim, he must cause a sheriff-officer to give a copy of it to the pursuer, at least one free day before the trial; otherwise, there are no written pleadings. On the day fixed for the trial, if the debtor does not appear, decree is given against him, with expenses, as a matter of course; against which he can afterwards be 'reponed' only on consignment of the expenses and a sum of 10s. If both parties appear, the judge hears the case. If the pursuer or the defender have clearly no good ground of action or defence, he disposes of it at once; but if not, he examines the witnesses on oath. No record of the evidence is taken. At any time before judgment, the case may be remitted to the 'ordinary court' of the sheriff, where it is conducted by agents on written pleadings and written proof. Otherwise, the whole proceedings are concluded in one day, adjournments not being permitted, except in special cases. After judgment, there is no appeal, except on the ground of want of jurisdiction, malice, oppression, or wilful neglect of the statutory forms, in which cases there is an appeal to the Court of Justiciary. If the sum decreed for, together with the expenses, do not exceed £8, 6s. 8d., there is only execution against the debtor's goods; above that amount, there is also execution against the person.

Recently, the Debts Recovery Act, 1867 (30 and 31 Vict. c. 96), has extended the small-debt jurisdiction, with important alterations, to £50. The class of debts that may be sued for between £12 and £50, has been limited to those which most require summary proceedings—namely, those which prescribe if not sued for within three years, such as all ordinary merchants' accounts, and accounts for professional services or for servants' wages. The principal differences between this and the proper small-debt proceedings are, that agents are allowed to appear; that there are two days in court, one at which the grounds of action and defence are stated, and an adjourned one, at which the witnesses are examined; that the judge makes a note of the pleas of the parties; that a record is kept (if required) of the admissions in fact and of the evidence; and that there is a right of appeal, if the debt does not exceed £25, from the sheriff-substitute to the sheriff, and if it exceed £25, also to the Court of Session. If the judge be not asked to take a note of the evidence, there is no appeal in matters of fact. All the fees and costs, whether payable to the sheriff-clerk, the officers of the court, or the law-agents, are distinctly stated in the act, and must be hung up in every court. In other respects, the proceedings are analogous to those in the Small-debt Court, and, like them, may proceed either at the principal town of the county, or at one of the towns at which sheriff's circuit-courts are held.

In England and in Scotland, there are other courts which deal with the recovery of debts beside the county courts. The Sheriff's Court of the city of London has a jurisdiction similar in general to that of the English county courts; and there are local courts, such as the Court of Passage at Liverpool, and the Manor Court at Bradford, which exercise jurisdiction in small as well as other debts. In Scotland, the magistrates of royal burghs, and the justices of peace, possess a small-debt jurisdiction for debts not exceeding £5 in amount. The procedure in them is similar to that of the Sheriff Small-debt Court.

DECAMPS, ALEXANDRE-GABRIEL, a celebrated French painter, was born at Paris in 1803. He was

a pupil of M. Abel de Pujol, the well-known historical painter, but he seems not to have been very amenable to tuition. He was one of those who cannot be made to imitate approved models, and he soon began to strike out a style of his own, which was new to the public, and was long in becoming popular. About 1830 he made a tour in the East, which had a considerable effect upon the character of his works. For several years after his return he painted chiefly Eastern subjects. Either the novelty of his subjects—Eastern scenes and customs being then comparatively unfamiliar to Europeans—or the novelties of his manner, made the public hesitate in its verdict upon these works; while they were not unfrequently rejected by the jury at the Academy of Paintings. Gradually, however, they grew into favour; and the prices fetched by these and the other works of D. shew that he is now among the most esteemed of the artists of his time. He painted landscapes, genre-pieces, and historical pictures; but though he has produced works in each of these kinds which are of the highest order of merit, his animal pictures are those which first attained to popularity among his countrymen. D. had a great deal of humour; and he loved to paint animals of all kinds. The monkey was his speciality; and a series of humorous pictures in which the monkey, or groups of monkeys, are introduced—now widely known by engravings or lithographs—were among his best and most popular works. In one of this series, *Les Singes Experts*, he managed to convey a stinging criticism upon the judges at the Academy who were so slow to admit his merit as an artist. Successful as he was in animal painting, D. was much chagrined by the preference shewn by the public for his genre over his historical pieces—which, by English critics at least, are now considered among the finest productions of the French school. Of his landscapes, and even of his historical works, the majority are taken from Eastern subjects. It was perhaps a consequence of the tardy recognition given to him by critics and other authorities, that not more than one of his pictures is now in a public collection in France. His works are in private hands; but at the Exposition Universelle of 1855, sixty of them were brought together, and an opportunity was thus afforded of comparing them with the more accessible works of other contemporary painters. His pictures divided attention with those of Ingres, Delacroix, and Vernet, and received the award of a medal. D. was made a chevalier of the Legion of Honour in 1839, and was promoted to the grade of officer in 1851. He died at Fontainebleau on the 22d of August 1860, of injuries which he sustained by falling from his horse.

Humour, as has been indicated already, was one of the principal characteristics of D.'s most popular works. His really great—his historical—works were remarkable for the fineness, in many cases the grandness, of the conceptions, and for a large and free style of treatment deemed over-daring and irregular by connoisseurs, but usually resulting, nevertheless, in a very impressive *tout ensemble*. Undoubtedly, his execution had considerable faults, but they were closely associated with its merits. His drawing was often careless, and when some favourite effect was to be produced, he never hesitated to set perspective at defiance. The boldness of his colouring, and the startling light-effects introduced in his pictures, were what critics at first found most fault with. These are, however, the peculiarities of his manner, and now that they are no longer strange, they find not only apologists but admirers. If they were merits, they were of a kind which, in the hands of imitators, were very apt to

degenerate into faults, and the French artists who have taken D. for their model, have, by their exaggerations, done not a little to imperil the reputation of their master.

DECTAUN, a town of India, in a detached portion of the native state of Gwalior, belonging to Scindia, on the route from Mow to Baroda, twenty miles west from Mow. It is the capital of a pergunnah of the same name. It is 1891 feet above the sea. Pop. estimated at 6000.

DELFTSHA'VEN, an old town in South Holland, is situated on the Maas, two miles west from Rotterdam. It is defended from floods by three strong dykes. The principal buildings are the Reformed Church, which is a handsome cruciform building, the Roman Catholic Church, and the town-house. There is some trade and shipping; but the chief sources of wealth are distilling spirits, beer-brewing, ironfounding, ship-building, sawing wood, and other industries. In 1865, pop. 5424.

DELIRIUM EBRIOSUM, a term intended to denote a form of acute mania, having intoxication for its exciting cause. It is often mistaken for Delirium Tremens (q. v.), and doubtless has frequently been dealt with as such in criminal cases. It originates either from a single fit of intoxication, or a short course of intemperance—frequently of periodical occurrence—in those who are mentally excitable from hereditary peculiarity of constitution, or from some previous injury of the head, and who may have experienced some cause for depression of spirits. It is marked by an uncontrollable desire for drink, which, when gratified, only leads to further imperious demands, until the thing itself is loathed, and a fit of sickness brings about recovery. In the course of the paroxysm, however, more or less of indecorous conduct or wild and vicious passions are displayed; so that, unless the affected is restrained, and stimulants withdrawn, violence is apt to be offered to any one coming in the way. It is in this state that homicide and murder are so frequently perpetrated. On the delicate question of legal responsibility connected with this state, we do not here enter.

DELIRIUM NERVO'SUM or TRAUMATICUM, a term given by Baron Dupuytren, the celebrated French surgeon, to designate an attack of delirium with tremors, which frequently supervenes on severe bodily injuries, such as gunshot wounds, burns, and fractures—chiefly met with in large hospitals—in the case of persons of weakly constitution, and who are irritable and nervous, and have been intemperate in their habits. It has been considered by some as identical with Delirium Tremens (q. v.), but it only simulates that affection, being but a symptom of a sympathetic fever, having a typhoid character.

DELIRIUM TREMENS is the term given to a disease originating from the abuse of alcoholic stimulants by those of a nervous and irritable temperament, characterised by a combination of delirium with muscular tremors. The tremors are general, but chiefly of the hands, and of the tongue when protruded; and the delirium is of a muttering, sight-seeing, bustling, abrupt, anxious, apprehensive kind. The individual affected cannot follow out a train of thought, explain an illusion or perverted sensation, or perform any act correctly; and although at one moment partially conscious and rational, is the next incoherent and excited by the most ridiculous fancies of a spectral kind, such as visitors in the shape of devils, cats, rats, and snakes, or by alarming occurrences, such as robberies, fires, and pursuits for crimes. All this is ushered in and

DELIRIUM TREMENS.

attended by complete sleeplessness; and during the attack, in an uncomplicated form, there is no violence or ferocity of demeanour (see article DELIRIUM EBRIOSUM), although mischief to himself or others may be done under false impressions; and he is easily pleased by gentleness and indulgence, and fretted by restraint and opposition. The face has generally a pale dirty colour, and anxious expression; eyes startled but lustreless, sometimes considerably suffused, and the pupils not contracted, unless under treatment with opium, or when inflammation of the membranes of the brain has supervened; skin warm and moist, often perspiring copiously; tongue sometimes loaded, but generally pale, moist, and remarkably clean; appetite small, but the individual will often take whatever is presented to him; thirst by no means urgent, with seldom or never any craving for spirituous liquors; alvine evacuations bilious and offensive; urine scanty, high coloured, and often albuminous; the pulse usually ranges from 90 to 120, and is generally soft, but of various degrees of fulness and smallness. The precursory symptoms are not peculiar to or pathognomonic of this disease, but common to many other febrile affections implicating the functions of the sensorium, of the circulation, of digestion; and the paroxysm—distinguished by the above phenomena—runs a remarkably uniform course, independently of age and constitution. In genuine uncomplicated cases—that is to say, when not precipitated by other illness, such as bronchitis, pneumonia, erysipelas, and fever; or some accident, such as contusions and fractures—when the illness is more of the nature of the Delirium Traumaticum (q. v.)—the paroxysm runs its course in from two to three days, and terminates in sleep, from which the individual generally awakens convalescent.

The above description has been taken from a paper by Dr Peddie of Edinburgh, referred to underneath, whose views shall here be further developed. Previous to its publication, the generally received opinions regarding the essential nature of delirium tremens were, that it is a disease of exhaustion or irritation of nervous power, and that it has the habitual abuse of intoxicating liquors for its predisposing, and the abstraction or diminution of the accustomed stimuli for its exciting, cause; and consequently, that the proper treatment consists in the continuation of stimulants—'a hair of the dog that bit'—together with large opiates to act on the same principle, and force on the salutary, or what has been called the critical sleep. Since then, however, a great revolution has taken place in the views of the medical profession regarding the pathology and treatment of delirium tremens; and in consequence of this, a fatal result in a genuine case of the disease now seldom or never occurs, where these views are understood and acted on.

It has been shewn that the more the history and phenomena of the affection are examined, the greater will the difficulties surrounding the second part of the proposition above stated become. It has been shewn that the affection is specific and peculiar, uniform in its symptoms and progress; and that it is essentially a form of nervous poisoning—a toxicological result from the accumulation of alcohol in the system through the continued abuse of stimulants. It has been observed that the alcohol—in whatever way it may be atomically changed or chemically combined—acts on the nervous pulp of the brain through the medium of the circulation, and sets up in it an alcoholism or alcoholic erethism, manifested by a certain amount and kind of exhaustion of the cerebral and muscular functions, together with decided over-action in the meningeal vessels; and that the alcoholic principle, although

acting at first slowly, begins ere long to poison the gray matter of the brain, so that every additional drop thereafter brings it more and more into a poisoned condition, until at length, unless arrested by judicious treatment, the state of irritation tends to inflammatory action and serious encephalic mischief. While, therefore, the first part of the above proposition is true—though explainable in a very different way from formerly received opinions—the second part, viz., that the diminution or abstraction of the accustomed stimulus, is the exciting cause of the disease, is altogether untenable. Analogy will not bear out the assertion. Mercurial fumes, or the oxides of mercury, when long inhaled or absorbed into the body, as in the case of quicksilver miners, gilders, and others, in the course of time produce an attack of shaking paralysis—the *tremblement mercuriel* of the French pathologists; but will the workmen thus long exposed be more likely to become affected with tremors when removed from this poisonous atmosphere and occupation, than if continuing at their work? The reverse is well known to be the fact, not only in the case of such artisans, but of those who are beginning to suffer in a somewhat similar way from lead-poisoning. In both affections, when the symptoms are precursory or recent, a cure can be effected only by removal from the injurious occupation; otherwise, the symptoms deepen with hourly increasing rapidity, until tremors are succeeded by sleeplessness, delirium, and ultimately coma. Then, too, for example, salivation from any of the preparations of mercury, and narcotism from any opiate, are not intensified by withdrawing these agents after a certain point is reached. On the contrary, a continuation beyond that stage, particularly in some kinds of constitution, more rapidly develops their peculiar physiological manifestations; and now, an infinitesimal dose will do what a large dose in an earlier stage could not. Thus it is with alcoholic stimulants in the production of delirium tremens. In those of a highly sanguine temperament, and of a nervous irritable disposition, the effect of a certain length of indulgence is to induce this condition (just as in subjects with the tendency to gout, a certain amount of high-living is apt to produce an attack of that affection), and beyond that stage, a small quantity of alcoholic stimulus will keep up and deepen the effect, which, previously, a large dose would not do, or, in another individual, could not produce, whatever quantity is imbibed. Thus is explainable the very common erroneous statement made in regard to an individual affected with delirium tremens; that although for a considerable time he had systematically indulged in considerable quantities of spirits, wine, or malt liquor, or in all of these, yet for a week or two he had drunk very sparingly, and, within the last few days, little or none; indeed, that he was now suffering from the withdrawal of his wonted stimulus, in meritorious efforts to free himself from a habit of which he had begun to be ashamed. All this seems plausible: but the statement should rather have been that, although consuming large quantities of drink at one time, he had felt latterly a smaller quantity affect him; that he then reduced still further the amount, but experienced an equal if not greater constitutional effect therefrom; and thus, from day to day, reduction was forced on him by his own sensations of gastric irritation, nervous excitement, and muscular debility—these feelings being, in fact, neither more nor less than the premonitory symptoms of an attack of delirium tremens, and just what might be looked for on the view that the alcoholic principle is in such instances a cumulative poison, and the exciting as well as the predisposing cause of the

affection. That such is the true solution of the problem, cannot be doubted; and if a suspension or diminution of habitual supplies of stimulants be at any time followed by symptoms of delirium tremens, this is not to be regarded as the result of the change in the practice of the individual, but as occurring in spite of it, and because the constitutional effect is already produced, and the premonitory stage of the disease begun. In a considerable number of instances, drink is taken freely up to the period when the disease is developed, there being no diminution of the quantity consumed, and no interval in the practice; and when there really is some diminution from the amount of previous supplies, it is on account of the system being already affected so much that a less quantity now produces a greater or equal effect. On the other hand, it may be safely averred, in contradiction to the popular error, that although stimulants are at once taken away from the habitual dram-drinker, a paroxysm of delirium tremens will not be produced if the peculiar diathesis is not yet established, and the precursory symptoms of the disease are not already begun. He may experience much mental disquietude and physical discomfort, and feel weak for a time, just as a gourmand would feel lowered and depressed by the abstraction of his accustomed good living; but this would soon pass off, without the occurrence of the usual signs of delirium tremens, more especially without those spectral illusions or phantasms, which are common to poisonings with several other agents of the narcotico-acrid class.

It seems unnecessary to add more on this part of the subject, than that experience derived from some of our large prison-establishments shews that while fully three-fourths of the criminals committed belong to the intemperate classes, and a large number, especially of the debtor class, are habitual drinkers up to the moment of admission, no bad effects are observed from the sudden withdrawal of the wonted stimuli, and the substitution of prison-fare.

In regard to the treatment of this remarkable disease, it is evident, from a common-sense consideration of its phenomena and pathology, that the non-stimulating and non-opiate plan must be the safest and best. If more spirits deepen the paroxysm, by producing greater cerebral determination, then why administer even one drop additional? And if opiates combined with spirits, or given alone, act in the same manner, and tend to occasion congestion in the blood-vessels of the brain, why run the risk of inflammation, convulsions, and coma, in an endeavour to force on the salutary sleep? It must not be overlooked that this sleep is the normal termination of the paroxysm, and is not to be viewed as a part of the affection, or in the same light as we are accustomed to regard a critical sweat or other discharge. It indicates diminished activity of the cerebral circulation and functions, and the commencement of convalescence. Hence, in a large proportion of instances, the sleep will take place spontaneously, and it will be safer to do nothing at all. The object, therefore, of treatment should rather be to remove all hindrances to sleep than to force it. In the more severe cases, this is best done by a moderate and well-regulated course of tartrate of antimony, the action of which, in this affection, appears to be remarkably sedative. It greatly diminishes excited action, induces weariness of muscle, general nervous exhaustion, and mental languor. It thus removes all obstacles to the occurrence of the salutary sleep, and favours it; and when the individual exhausted seeks his couch, he finds repose—not as a drugged sleep, but naturally and profoundly—awaking in general with restored reason and muscular control.

Digitalis has been given with the same view, also *ipecacuanha* and *aconite*; but none of these answer the various ends so well as antimony. In the milder cases, however, no medicine is required, and it seems enough to do in such, what is essentially necessary in the severer attacks—to support the strength—the organic functions of life—by suitable nourishment, such as soups, *café au lait*, and white-of-egg, and to soothe in every possible manner the excited feelings of the patient. Nothing is more hurtful in delirium tremens than restraint, particularly that of the strait-waistcoat. It increases the cerebral excitement by the never-ceasing struggles for liberty which ensue, so that fatal convulsions have very frequently been the result. All the control required is the presence of one or two judicious attendants, who will humour the patient in his whims and fancies; who will speak and act regarding them so as to assure him of safety, and to relieve him of that apprehension which is the most characteristic feature of the delirium; and who will mildly but firmly interpose, if he attempts anything which may accidentally prove injurious to himself or others. The apartment, however, in which the patient is confined should be well secured, for he may rush out at the door, or leap from a window, in the fright and frenzy of imagined danger. The larger, too, the room is, the better, that he may have space to advance and retreat, according as he wishes to scrutinise or avoid a suspicious or distressing object of his fancy; to arrange and rearrange the furniture; or to carry on, after a fashion, the imaginary duties of some bustling occupation. Besides this, there should be abundance of light, so as to dissipate terrifying hallucinations. The expenditure of muscular effort without any restraint, aids greatly in producing a safe kind of mental and physical exhaustion; and the individual, languid and worn-out, lies down voluntarily, and falls into the desired and restorative sleep.—*The Pathology of Delirium Tremens, and its Treatment without Stimulants or Opiates*, by A. Peddie, M.D., F.R.C.P.E., &c., pp. 51, 8vo. (Sutherland and Knox, Edinburgh, 1854.)

DELITZSCH, a town of Prussian Saxony, 15 miles north from Leipzig, with which it is connected by railway, on the right bank of the Lobber, a small river. It is an old but well-built town, and has manufactures of tobacco, woollen cloth, and hosiery. It is the capital of a circle, for the most part flat, but producing much corn and fruit. Pop. (1864) 7643.

DEFLLYE, a seaport town of Algeria, 49 miles east from Algiers. The French part of the town has wide streets, and a square planted with trees. The Arab part, which is greatly more populous, retains its old character: its streets are narrow and tortuous. The climate of D. is reckoned very salubrious. The vine and the olive succeed well in the neighbourhood. *Bechena*, a kind of sorghum or durra, is a principal crop. There is a considerable trade in grain, oil, and salt. Pop. (in 1861) 3600.

DELPHINORHYNCHUS, a genus of cetacea of the family *Delphinidae*, having one dorsal fin like the true dolphins, but the beak not distinguished from the forehead by a furrow. *D. Bradanensis*, or *D. rostratus*, a species about eight feet long, black above and reddish below, has been thrown ashore on the French Atlantic coast. A much larger species, *D. coronatus*, attaining the length of thirty to thirty-six feet, is described as one of the whales of high northern latitudes, having been seen in numerous flocks among the ice-islands near Spitzbergen.

DELUNDUNG (*Prionodon gracilis*), a carnivorous animal inhabiting the forests of Java, referred

to the family *Viverrida*, but regarded as a connecting link between that family and *Felida*. It is of

Delundung (*Prionodon gracilis*).

slender form, with a long cylindrical tail, and is prettily streaked and spotted.

DEMAVEND, MOUNT, an extinct volcano of Persia. It forms the loftiest peak of the Elburz Chain, which separates the low shores of the Caspian Sea from the high table-land of Persia. Although no longer subject to eruptions, D. bears traces of its having been an active volcano within the most recent geological epoch. Its summit is conical, covered with sulphur, and rent by heated fissures. The crater is still visible, and the surface of the mountain is in many places covered with scoriae. At its base hot springs give evidence of the continued existence of volcanic fire at no great distance beneath the surface. A great deposit of sulphur covers the summit of D., and is brought down to the plains in bags to be disposed of as an article of commerce. Although the path that leads to the peak is, for this reason, familiar to the inhabitants of the adjoining districts, the mountain was not ascended by any European till 1837. In September of that year Mr William T. Thomson of the English Embassy at Teheran, with the view of taking important bearings from a point which commands an extensive view of the shores of the Caspian, determined to reach the summit. He set out from the base with four guides, three of whom deserted him when they experienced the effect of the rarified atmosphere on their breathing. The first night he slept below the snow limit; the second night in a sulphur cavern near the summit, so highly heated that it was impossible to place the hand near a crevice of the interior. On leaving this place of shelter, the traveller's wet clothes were instantly frozen with a bitter blast from the Caspian. The height, as recently determined by the Russian Survey, is 21,000 feet.

D. towers high above the neighbouring mountains, the adjacent summits not exceeding two-thirds of its elevation. At all times it has been a conspicuous object from the great trade route between India and the West, along the edge of the Persian table-land. It is not then to be wondered at that it is connected with the earliest Persian as Etna is connected with the earliest Greek traditions. There seems indeed more than an accidental coincidence between the fables which relate to the two mountains. According to the Greeks, the giant Typhon was buried under the volcanic region of Sicily, and the earthquakes and eruptions were caused by his efforts to escape. Fire proceeded from his mouth, and he was figured with one hundred snakes growing from each shoulder. Zohak, a personification of

the had principle, was in the same way supposed by the Persians to be buried under Demavend. He was figured with one serpent growing out of each shoulder; and in other respects he had much in common with the Greek monster.

DENNERY, or D'ENNERY, ADOLPHE PHILIPPE, a French dramatic writer of Jewish extraction, was born at Paris on June 17, 1811. His first employment was that of clerk to a notary; he gave that up to become a painter; and afterwards, while still very young, he became a contributor to the newspapers. The first dramatic work in which he had a hand was brought out in 1831; this was *Emile, ou le Fils d'un Pair de France*, and it was produced by him in concert with M. Charles Desnoyer, a well-known *littérateur* and theatrical critic. It had some success, and D. followed it up with two or three others, which had so much popularity that his services as a play-writer came into considerable demand. He was a ready writer, and always able to come up to a fair standard of merit; and, encouraged by the theatrical managers of France, he has been one of the most prolific of dramatic authors. He has produced, by himself or in concert with others, about 200 pieces in one style or another; and a few years ago, nearly a hundred of his pieces might be seen upon the stage at one time. Latterly, D. has been a man of business as well as an author. He was appointed director of the Théâtre Historique in 1850, but resigned this appointment almost immediately. An attempt which he made in 1855 to establish a new theatre, which he first proposed to call the Théâtre du Peuple, and afterwards the Théâtre du Prince Impérial, did not succeed; but since that, he has had a large share in establishing and in managing a public company, in which many persons connected with the press and with the theatres were concerned—the Société Thermale de Cabourg-Dives. Of this company, whose speculation consisted in developing the attractions of a new watering-place (in the dep. of Calvados), he has been successively secretary and managing director. D. was decorated with the Legion of Honour on the 10th December 1849, and was promoted to the rank of officer on the 16th of August 1859.

DENTARIA, a genus of plants of the natural order *Crucifera*, having a lanceolate compressed silique. One species only, *D. bulbifera*, is found in Britain, and is a rare plant, with a simple stem, the lower leaves pinnate, the upper leaves simple, and rose-coloured flowers, the axils of the leaves producing bulbs, and the creeping rhizome having tooth-like knobs, whence the name D., and the English name Coral-root. The root, when dried, is said to have greater pungency than pellitory of Spain, and was formerly used in the same way for toothache. *D. diphylla*, a North American species, is called Pepper-root from the same property.

DEOBUND, a town of India, in the British district of Suharunpore, North-west Provinces, 20 miles south-east from Suharunpore, on the route from Suharunpore to Mozuffurnuggur. It is situated between the rivers Hindun and Kali Nuddee, the one a branch of the Jumna, the other of the Ganges, in an open cultivated country. Pop. 18,638.

DERA'YEH, or DEREY'EYAH, a town of Arabia, formerly the capital of the Wahabees. It is situated near the centre of Nedjed, 430 miles north-east from Mecca. It was a town of some consequence before the time of the Wahabees, but attained its highest importance under their dominion. See WAHABIS. It was taken by Ibrahim Pasha in 1819, after a siege of seven months, and nearly destroyed. It stands in a valley about half a mile in breadth, filling the whole breadth of the valley,

and may probably have at one time contained 40,000 inhabitants, whereas now its pop. is not estimated at more than 15,000. The situation is very beautiful, and rich gardens and fields are interspersed with the houses and scattered around the city.

DE'SIO, a town of North Italy, in the province of Milan, 11 miles north of Milan, on the Milan and Como Railway. It is a well-built town, surrounded with gardens and vineyards, and has a fine hospital. The inhabitants are chiefly employed in agriculture and the rearing of cattle. Pop. 4574.

DEWA'S, a town of Malwa, India, 24 miles north-north-east from Indur, on an affluent of the Chumbul. It is the capital of a petty state or raj under British protection, held conjointly by two chiefs of the lineage of the Puar or Pramara Rajpoots, once very powerful, although now of fallen fortune. The military force of the state consists of 175 horse and 500 foot; the pop. is about 25,000, the revenue about £40,000.

DHO'LKA, a town of India, in the British district of Ahmedabad, presidency of Bombay, 22 miles south-west from Ahmedabad. It is situated in the midst of ruined palaces, mosques, mausoleums, and spacious tanks lined with masonry. It is surrounded by a mud wall four miles in circuit. Pop. 25,000.

DIAPASON REGULATOR. The French, who give the name of *diapason* to the tuning-fork, have lately made attempts to use that instrument in connection with clockwork, partly as a means of counting very small intervals of time. M. Duhamel made an arrangement in which a cylinder, by means of a screw-tapped end, was made to advance a little in the direction of the axis; this cylinder was covered with blackened paper, and was rotated by means of clockwork. A diapason had a style or marker, made of a small bit of pointed spring, fixed to the end of one of the prongs. On the diapason being sounded in the usual way, and the spring placed lightly against the cylinder, the style traced a sinuous white line on the black paper. The sinuosities became visible representatives of minute intervals of time, the prongs vibrating possibly hundreds of times in a second. M. Lissajous devised an electrical apparatus to prolong the vibrating of the prongs; but it was too complex for practical use. M. Breguet then proposed clockwork for this purpose, superseding the pendulum and the spiral spring by a diapason. The diapason regulates the rate of motion of the train of wheels by the equality of the vibration of the prongs, while the train of wheels tends to increase the time during which the prongs vibrate and sound. An index, carried by an arbor round a dial, may be made to count or record the vibrations. Breguet's experiments have gone as far as instruments giving 200 simple vibrations (100 double or to-and-fro vibrations) per second. There are means of making the diapason more or less acute in sound, or with a greater or less number of vibrations in a second, by mechanical treatment of the prongs: it can, by a proper distribution of metal, be made to yield any required note within certain limits; and thus, with the aid of the style, the paper, and the cylinder, it may be made to give a kind of visible existence to excessively minute intervals of time, such as $\frac{1}{1000}$ th part of a second. Fuller details are given in Breguet's description of the apparatus in the *Revue Chronometrique*.

DI'CHROISM (Gr. *dis*, twice, *chroma*, a colour) is a term chiefly used in Crystallography to designate the property which many doubly-refracting crystals possess of exhibiting different colours, when viewed in different directions. It, or the allied term,

Dichromatism, has also been applied to those fluids which appear of different colours when viewed by reflected and refracted light; when seen in thick or thin layers, &c. For example, venous blood, or any blood impregnated with carbonic acid, hydrogen, or nitrogen, appears, when seen in moderately thin layers, to be of a purple colour; while in extremely thin layers it appears green.

DIETERICHS, JOACHIM FREDERICK CHRISTIAN, an eminent veterinary surgeon, was born on the 1st of March 1792, at Stendal, in Prussia. He was at first a farrier; but at the age of 21, he obtained a fellowship at the Veterinary College of Berlin, where he soon attracted notice by his proficiency. In 1817, he gained, after a brilliant examination, the title of Superior Veterinary Physician. In 1818, he undertook, at the instance and expense of the Prussian government, a tour through France, Wurtemberg, Bavaria, Austria, and Hungary. On his return, he was appointed to a chair in the Veterinary College of Berlin, which he held for four years. In 1830, he accepted a post in the General Military School of Berlin, where, in 1841, he was appointed Professor in Ordinary. His publications, which are widely known, and have been translated from the German into various languages, are on *Pulmonary Consumption in Cattle* (Berlin, 1821); *Manual of Veterinary Surgery* (1822); *On the Art of Shoeing Horses* (1823); *On the Breeding and Propagation of Races* (1824); *Manual of General and Special Pharmacology* (1825); *On the Education of Horses* (1825); *Manual of Special Pathology and Therapeutics for the Use of Veterinary Surgeons* (1828); *Manual of the Practical Knowledge of Horses* (1834); *Manual of Obstetrics* (1845); *Manual of the Education of Domestic Animals* (1848); *The Principal Defects of Horses, and the Mode of Diagnosing them* (1853); *Names of the Particular Regions of the Horse, with Indications of Maladies and Defects* (1853).

DIETRICH OF BERN, the name under which the Ostrogoth king, Theodoric (q. v.) the Great, appears in the German heroic legends; in which by Bern, his capital, Verona, is to be understood. As early as the 7th c., he would seem to have become the centre of a distinct cycle of legends. A little later, he was, with a not unusual disregard of all historical truth, brought into connection with the traditions of Attila, or Etzel. According to these legends, D. is said to have fled from Italy before Ottacher (Odoacer), or Ermanarich; to have met, along with his attendant vassals, with a hospitable reception from Etzel; but after many years, to have again got possession of his kingdom. The extermination of the royal House of Burgundy by Attila, which is an historical event, was the cause that D., as well as Etzel himself, was woven into the Burgundian and Frankish Siegfriedsage; and thus he appears, in the second part of the *Nibelungen*, at Etzel's court, and is handled by the poet with special predilection. There have been numerous poems, besides, of which D. was the centre and principal hero. It is very probable that the *Hildebrandslied*, of the 8th c., is the fragment of such a poem. Except this, we have only late versions of these legends; for example, *Schlacht vor Raben* (Ravenna) of the 13th c., *Alphart's Tod* (13th c.), *Zwerg Laurin, oder der kleine Rosengarten* (15th c.), *Dietrich's Ahnen*, *Dietrich's Flucht*, &c.

DIKAMALLI, a gum-resin which exudes, in amber-coloured transparent drops, from the ends of young shoots of *Gardenia* (q. v.) *lucida*, an Indian tree. It has a very powerful fragrance, and has been found extremely useful in hospitals, in keeping away flies, and especially as a dressing for wounds

and running sores. It has but recently been brought into use.

DIKOWA, or **DEEGOA**, a large town of Bornu, Central Africa, about 60 miles south from Kouka, and about half that distance from the south-western angle of Lake Tchad. It is in a great cotton-growing district, and is a place of considerable trade. The spinning and weaving of cotton are also extensively carried on. The houses are mostly of clay, but each has its court-yard; and within the town are many magnificent fig-trees, the foliage of which contributes much to the beauty of its appearance. Pop. supposed about 30,000.

DYMA, a large town of Abyssinia, in the state of Amhara, on an affluent of the Abai, 150 miles south-south-east from Gondar. The houses are mostly of stone, and the church is one of the largest edifices in Abyssinia. The town is divided into many quarters by stone walls.

DIMIDIATION, in Heraldry, a mode of marshalling arms, adopted chiefly before quartering and impaling according to the modern practice came into use, and subsequently retained to some extent in continental though not in English heraldry. It consists in cutting two coats of arms in half by a vertical line, and uniting the dexter half of the one to the sinister half of the other. Coats of husband and wife were often so marshalled in England in the 13th and 14th centuries. Mr Planché traces the double-headed eagle of the German Empire to a dimidiated coat, with half an eagle for the eastern, and another half for the western empire.

DINDIGUL, a town of India, in the British district of Madura, presidency of Madras, at the extremity of a valley of the same name, on a feeder of the Cauvery, 247 miles south-west of Madras city. It is 700 feet above the level of the sea, and built on a gentle declivity; the streets are wide, the houses well built, and the bazaar plentifully supplied. The pop. is supposed to be between 6000 and 7000, exclusive of the military. The fort is situated on a wedge-shaped mass of gneiss, which rises to a height of 280 feet, perfectly naked, except near the summit, where some stunted trees and shrubs grow on patches of thin soil. The ascent is on the eastern side by a flight of stone steps, the other sides being nearly perpendicular. Near the summit, there is a well of great depth, popularly reputed unfathomable, which yields excellent water.

DIOCLETIANUS, VALERIUS, born in humble life near Salona, in Dalmatia, 245 A.D., inherited from his mother, Dioclea, the name of Diocles, which he afterwards enlarged into D., and attached as a cognomen to Valerius, a name of the most patrician associations. He adopted a military career, and served with distinction under Probus and Aurelian, accompanied Carus on his Persian campaign, and finally, on the murder of Numerianus having been discovered at Chalcedon, he was proclaimed emperor in 284 by the army on its homeward march. The suspected assassin of Numerianus, the prefect Arrius Aper, he slew with his own hands, in order, it is alleged, to fulfil a prophecy communicated to him, while still a lad, by a Druidess of Gaul, that he should accede to a throne as soon as he had killed an *aper* (wild-boar). In 285, D. commenced hostilities against Carinus (the joint-emperor along with the deceased Numerianus), who, although victorious in the decisive battle that ensued, was murdered by his own officers, thus leaving to D. the undisputed supremacy. His first years of government were so molested by the incursions of barbarians, that, in order to repel their growing aggressiveness, he took to himself a colleague—namely, Maximianus—who, under the title of Augustus, became joint-emperor

in 286. D. reserved for himself the charge of the eastern empire, and gave the western to Maximian. Still the attacks of the barbarians continued as formidable as ever. The empire was menaced by the Persians in the east, by the Germans and other barbarians in the west; and in order to provide for its permanent security, D. subjected it to a still further division. In 292, Constantius Chlorus and Galerius were proclaimed as Cæsars, and the distribution of the Roman Empire was now fourfold: D. taking the East, with Nicomedia as his seat of government; Maximian, Italy and Africa, with Milan as his residence; Constantius, Britain, Gaul, and Spain, with Trèves as his headquarters; Galerius, Illyricum, and the entire valley of the Danube, with Sirmium as his imperial abode. It was upon his colleagues that most of the burden of engaging actively in hostilities fell, as D. seldom took the field in person. Among the conquests, or rather re-conquests, that were made under his rule, may be enumerated that of Britain, which, after maintaining independence under Carausius and Allectus, was, in 296, restored to the empire; that of the Persians, who were defeated, and compelled to capitulate in 298; and that of the Marcomanni, and others of the northern barbarians, who were driven beyond the Roman frontier. D., after 21 years' harassing tenure of government, desired to pass the residue of his days in tranquillity. On the 1st of May 305, accordingly, he abdicated the imperial throne at Nicomedia, and compelled his colleague, Maximian (much against the latter's will), to do likewise at Milan. D. sought retirement in his native province of Dalmatia, and for 8 years resided at Salona (see SPALATO), devoting himself to philosophic reflection, to rural recreation, and to horticultural pursuits. Two years before his abdication, he was instigated by his colleague, Galerius, to that determined and sanguinary persecution of the Christians for which his reign is chiefly memorable. He died in 313.

DIOGENES, the Cynic philosopher, was a native of Sinope, in Pontus, where he was born about 412 B.C. His father, Icesias, or Icoetas, by name, and a banker by occupation, was convicted of having swindled, and so the young D. had to leave Sinope. His youth had been that of a spendthrift and a rake; but on coming from Sinope to Athens, he became interested in the character of Antisthenes, by whom, however, his first advances were repelled. In spite of his inhospitable reception, D. renewed the attempt to find favour with Antisthenes; but though often driven away by blows, his perseverance at last prevailed; and Antisthenes, moved with compassion, consented to admit him as a pupil. D., from being an extravagant debauchee, plunged into the opposite extreme of austerity and self-mortification. He would roll in hot sand during the heat of summer; in winter, he would embrace a statue covered with snow. His clothing was of the coarsest, his food of the plainest. His bed was the bare ground, whether in the open street or under the porticoes. His permanent residence (if such it could be called) was a tub which belonged to the Metroon, or the temple of the Mother of the Gods. His eccentric life did not, however, cost him the respect of the Athenians, who admired his contempt for comfort, and allowed him a wide latitude of comment and rebuke. Practical good was the chief aim of his philosophy; for literature and the fine arts he did not conceal his disdain. He laughed at men of letters for reading the sufferings of Ulysses, while neglecting their own; at musicians who spent in stringing their lyres the time which would have been much better employed in making their own discordant notes harmonious; at savans for gazing at the heavenly

bodies, while sublimely incognisant of earthly ones; at orators who studied how to enforce truth, but not how to practise it. He was seized by pirates on a voyage to *Ægina*, and carried to Crete, where he was sold as a slave. When asked what business he was proficient in, he answered: 'To command men.' His purchaser was *Xeniades* of Corinth; but the slave soon came to rule the master, acquired his freedom, was appointed tutor to the children, and spent his old age as one of the household. It was here that he had his interview with Alexander the Great. The king opened the conversation with: 'I am Alexander the Great,' to which the philosopher answered: 'And I am Diogenes the Cynic.' Alexander then asked him in what way he could serve him, to which D. rejoined: 'You can stand out of the sunshine.' Alexander is said to have been so struck with the Cynic's self-possession, that he went away, remarking: 'If I were not Alexander, I should be Diogenes.' In spite of his early excesses and his subsequent privations, D. lived at Corinth till 323 B. C., when he died, at the age of 90.

DIPSOMANIA (Gr. *dipsa*, thirst, and *mania*, madness, or eager desire) is a term intended, whether correctly or not, to denote a condition in which certain individuals manifest an irresistible craving for alcoholic drinks. **OINOMANIA** (Gr. *oinos*, wine), used by German writers; and the English **DRINKING INSANITY**, are also intended to designate the same state. It is of importance to distinguish dipsomanias from ordinarily intemperate and drunken individuals. In our streets and in society, we are only too familiar with the various phases of the habit and vice of drunkenness, and the different grades and circumstances of drinkers, such as the morning dram-drinker; the jolly social drinker; and the individual who, knowingly and intentionally, gives himself up to a debauch. While many thus of their own choice degrade and injure themselves, they are generally able, for a time at least, to perform tolerably well their usual occupations during business-hours. Many hard drinkers can exercise wonderful control over themselves, choosing the time to drink and the time to keep sober; and while sober, can discharge all their family, professional, social, or even religious duties—so far at least as outward appearances go. Some of them may drink continuously, until attacked by what is called *Delirium Tremens* (q. v.), or fall into the state of *Delirium Ebrosum* (q. v.); but when the supplies are stopped, and the necessary treatment is undergone, they are soon able to resume their usual duties, and too soon, in general, their former practices.

There is, however, especially in persons of a nervous and sanguine temperament and constitution—and more readily in women than in men—a condition in which the mere vice is transformed into a disease, the vicious habit into an insane, impulsive propensity, and then the drunkard becomes a dipsomaniac. The alcoholic principle, by habitual abuse, perverts the action, if not the nutrition of cerebral matter; and the frequent disturbances of the mental functions from fits of intoxication, the loose and irregular habits engendered, and the alternate states of remorse and attempts to drown conscience by more copious libations, all combine to create the dipsomaniac. He loses entire command over his will; has no power to resist the craving for alcoholic stimuli; and is transformed into the involuntary slave of an insane propensity. Physically, the dipsomaniac has a lamentably broken-down aspect; limbs feeble and tremulous; visage pale, leaden-coloured, or sordid; and eyes watery and lustreless. But in the manifestations of mind and heart, the change is still more sad. A process of mental deterioration goes on simultaneously with

the habit of indulgence; the main aim of life is how to obtain liquor; capacity for business is limited to the means of gratifying the craving; the precepts of morality and religion, the ties of nearest and dearest kin, have no sway over him; indeed, no consideration, human or divine, will interpose any barrier in the way of gratifying the propensity, whenever it is possible. Nor does he now drink with real relish, socially and convivially, but will swallow spirits, away from society and observation, even as it were a drug; and the only satisfaction derived from the act is, that it secures insensibility to the wretched state of mind which prompts the insatiable desire. When this has gone on for some time, although a suspension of the use of stimulants be imposed by the interference of friends, or the occurrence of an attack either of the form of delirium or maniacal excitement mentioned, yet his mind has suffered so materially, that unless control is exercised over him, and continued for a considerable period, he returns immediately like the 'dog to his vomit.' His moral feelings become more and more perverted, and his intellectual powers weakened. He is thus rendered either facile or wasteful, and incapacitated for the ordinary business of life; or he is irascible, resentful, or mischievous, and torments and annoys those about him, or commits homicide or suicide; or he becomes decidedly insane. Such is acquired dipsomania. But very frequently it is met with as a disease, *ab origine*—a constitutional, and, in the greater proportion of instances, a hereditary affection. When it takes this character, dipsomania resembles other constitutional diseases; and such cases especially illustrate its affinity to insanity. It is well known that gout and rheumatism, or disease of the heart, may be developed from errors in the mode of living of individuals in whose family connections there is no sign of predisposition; while, on the other hand, these diseases may also exist in virtue of a strong hereditary tendency, without any appreciable infringements of the laws of health. And so also dipsomania; for, while frequently resulting from acquired vicious habit, it occurs likewise from an insane hereditary taint, very frequently visited on children by the sins of their parents, especially if the latter have suffered from repeated attacks of delirium tremens, or have been in reality confirmed dipsomaniacs. Indeed, it has even been met with in the offspring of dipsomaniacs during the years of childhood, and that also in the sudden paroxysmal form. But what goes still further to prove its affinity to insanity, is the well-known fact, that in the family of the dipsomaniac, not only several cases of the insane drinking propensity are often met with, but marked instances of mental disorder in other forms. Some interesting examples of this may be found in the *Edinburgh Medical Journal* for April 1858, by Dr Thompson of the Perth prisons. When dipsomania thus occurs from constitutional organisation, the disease is assuredly of a worse type than when it springs merely out of the vicious habit of drinking. There is generally more eccentricity of habit and deportment, more perversity of mind and disposition, and more untruthfulness and deceit, which is a remarkably uniform feature in this malady. The victim of it is more unscrupulous in the means employed to gratify the ruling desire of existence; and when the disease is fairly developed, and allowed to take its course unrestrainedly, the moral sense becomes utterly perverted, and the intellect annihilated, so that the affected is readily led to the commission of crimes which would not otherwise be perpetrated, or sinks into a state of complete imbecility or hopeless mania. Whether, therefore, the disease exists in its ordinary phases and

intensity from voluntary intemperance; or whether it springs out of the propensity, as a consequence of abnormal organisation—and these are sufficiently characteristic to present a marked line of distinction from the ordinary vice of intemperance—the pathological and mental phenomena and results are the same—viz., an insatiable craving for alcoholic stimulants, with complete loss of self-respect and self-control in gratifying the desire, despite all obligations due to God and to man. There are generally also some special features in each case, affording additional evidence of decided mental unsoundness. Some of these are wastefulness and senseless extravagance; ridiculous eccentricity of conduct; gross indecency of behaviour, and obscenity and profanity of language; tendency to theft of articles of little or no value—often of one class or kind of things; extreme perverseness and vindictiveness of disposition; and impulsive violence, which leads readily to the commission of homicide or suicide.

These, then, are the features, variously combined in different cases (of which many examples could be easily given), which distinguish instances of dipsomania from ordinary drunkenness, and warrant the opinion that the condition described is a form of mental affection—a disease, like any other insanity. Almost all medical men, we believe, now hold this view, or at least that it should be treated as an insanity; and it has of late been very widely accepted by the general public, at any rate by all, without exception, who have come in contact with instances in their own families or among their friends.

If such, then, is a correct view of the case, it follows that special physical treatment must be adopted before moral and spiritual agencies can be expected to operate with any chance of success; and as the dipsomaniac is incapable of governing his own will, and making any effort to subdue his ruling desire, it is evident that he should be placed under the power of others who have the means of controlling him. From the very nature of the malady, however, it is scarcely to be expected that the inveterate drunkard will voluntarily submit to control, or continue under it for a sufficient length of time to receive lasting benefit; and therefore it seems essential, as in the case of other insanities, that legal power, with proper precautions and restrictions, should be available, to secure the possession of his person, and the protection of his property. It is undoubtedly the duty of a good and wise government to provide for such care, when it is so well known that the consequences of unrestrained action may be so serious to the individual chiefly concerned; when families are so often thereby plunged into deep distress or absolute ruin; and when the amenity of society is so frequently outraged by a display of mischievous eccentricity, or glaring indecency, or by the occurrence of some flagrant crime. 'The liberty of the subject' is a precious trust, but the absence of law to meet the case of the insane drunkard, is in reality licence for evil, since no precaution is taken to prevent most grievous infringements of the liberties of others. It is certainly an overstrained delicacy in legislation to shirk interference with a class of cases which lead to so much private misery and public expenditure, as the records of our courts of law, prisons, poor-houses, and lunatic asylums can amply attest. But considering the case of the dipsomaniac from another point of view, a facility by law to control, would confer on himself an unspeakable benefit. It would thus afford him his only chance of cure and restoration to society, instead of permitting him to go on

to wreck and ruin. Indeed, the neglect of law to provide such a check and remedy, seems inconsistent, unjust, and inhumane, when we consider, that while it permits the insensate drunkard to endanger his life, to waste his property, and deprive his family of that which they are justly entitled to expect from his hands during life, or to fall to them at his death, it holds him responsible for any criminal act he may commit. No doubt, the law assumes that he drinks voluntarily, and with his eyes open to all the consequences, and that his practices therefore form an aggravation of his guilt; but such is not the case, for he drinks—as has been shewn—involuntarily, and without any reflection as to ultimate consequences; and he is manifestly unable to exercise his reason aright, or govern his will. That the existing law of lunacy does not meet the case of insane drinkers, is well known, and much felt. One would imagine that the definition of insanity—'a person so diseased and affected in mind as to render him unfit to be at large, either as regards his own personal safety and conduct, or the safety of the persons and property of others or of the public' (20 and 21 Vict. c. 71, s. 3); and again, 'a person of unsound mind' (25 and 26 Vict. c. 54, s. 1)—recognises a dipsomaniac as a fit object for control. But the ancient dicta of English and Scotch judges, as to the nature of insanity, still appear to adhere to the legal mind; and as medical certifiers now require to state the facts on which they form their opinion, the statement that one or the chief manifestation is excessive intemperance, or an uncontrollable craving for intoxicating liquors, is quite enough to prevent a sheriff—or at least some sheriffs—from granting the wished-for warrant. He declines to interfere unless there is evidence of some furiosity in the case, or the existence of a delusion; and in all probability, were he to do otherwise, and the case be carried into court, a deliverance would be given against the plea of insanity. At any rate, the uncertainty in the administration of law in such cases, and the danger of subjection to annoyance and expense, even did they gain their plea, deter medical men from granting certificates, which, otherwise, they would most unhesitatingly do. In the last Lunacy Amendment Act (29 and 30 Vict. c. 51, s. 15, 1866), as permission is given to the superintendent of any asylum, with assent, in writing, from one of the Commissioners in Lunacy, to admit as a boarder any person wishing to submit himself to treatment—whose mental condition is not such as to warrant certificates of insanity—it was supposed likely to open a door for the admission of dipsomaniacs. But it has only in a very few instances, and for a very brief period of time, been taken advantage of, under the temporary pressure brought to bear on them by friends, &c. Indeed, there is the same difficulty in getting individuals to go voluntarily into private sanitarium, refuges, and boarding-houses for inebriates—where no legal steps are available—or, when admitted, to detain them sufficiently long so as to effect a cure.

Establishments for inebriates, on a small scale, have existed in this country for many years; and there are at present several excellent ones, for the middle and upper classes, in various parts of the country, particularly in Argyleshire, Ross-shire, Inverness-shire, and Perthshire; besides, several medical men, clergymen, and farmers throughout Scotland receive one or two boarders of this class. Into these places, however, only a very few individuals go quite voluntarily; in fact, it is generally under more or less constraint. Straitened circumstances, bodily suffering, the tears and entreaties of relations, threatenings of being cast off altogether, and such-like influences, may succeed perhaps in one

out of ten or twelve instances; but soon abstinence from drink, judicious medical treatment, good diet, pure air, exercise, occupation, and amusement, so improve the physical condition, that ere long, and before deeper and more radical changes can be effected, or the tone of the moral feelings restored, they become restless, and demand liberty as a right, which they know well cannot be disputed. Out in a few weeks or months, therefore, fully three-fourths of those admitted go, or are taken by injudicious or timid friends, and the result may easily be imagined. Years rather than months of control, and gradual trials of liberty on probation, are necessary to effect a permanent cure in any considerable proportion of the more confirmed cases of this malady. Taking into consideration, therefore, these uncertainties, there is evidently not much inducement for parties to invest money in the establishment of a desirable and trustworthy institution. For a good building, in a pleasant and salubrious situation, with some ground attached, must be secured; the furnishings must be comfortable, the cooking good, and considerable opportunities must be provided for within-door and out-door occupation, amusement, and cheeriness. In fact, all the arrangements must be made so as to provide such new and relishable enjoyments as will counteract or take the place of the cravings for alcoholic stimuli, and prevent, as much as possible, discontentment with the situation in which they are placed. Admission to the private boarding-houses, which do exist in this country is generally at the rate of £100 per annum—unless some extra accommodation or arrangements are required; and payments are made quarterly in advance. The chief stipulations made on entrance are, that no pocket-money be allowed; that no stimulants are to be placed on the table, or given, unless in particular circumstances, under medical direction, since the smallest quantity tasted is apt to keep up or excite a desire for more; and that should there happen to be any hotels, taverns, or spirit-shops in the locality, intimation be made at these places, that no debts will be paid for drink furnished to the boarders. The only public institution in Great Britain for the treatment of inebriates is the Queensberry Lodge, Edinburgh, in connection with the House of Refuge. Into the latter, from 100 to 200 intemperate persons—chiefly of the lower classes, and mostly females, have for a number of years been admitted; but a year ago, a handsome building, distinct from the Refuge, was finished, and comfortably furnished so as to accommodate 27 female boarders of the better classes, at the rates of from £40 to £100 per annum, according to the accommodation given. Already a considerable number have been admitted; and in several instances, apparently with excellent results, although, as yet, there has not been time to test satisfactorily the success of the institution. It is to be hoped, however, from the excellence of its design and management, that its social results will be most valuable; and that it will prove the practicability of working such an institution, after it is once founded—and even with lower scales of payment for board—so as to become self-supporting. From this, a good hint may be taken by any one who has money to bequeath for a truly benevolent purpose.

In several cities of the United States of America, somewhat similar institutions are in active operation, some of them amply endowed, others partly supported from public funds, although into all the admission is only voluntary. Of these, in the state of Massachusetts, the Boston 'Washingtonian Home' was incorporated by the legislature in 1859, and is pointed to as a model institution—although on a small scale—with results highly satisfactory. But the institution about which we have heard

most is the New York State Inebriate Asylum, at Binghamton. It is a massive and costly structure sufficient to accommodate about 200 individuals, amply endowed, and possessing every arrangement and appliance for the treatment of the unfortunate class requiring its aid. But its usefulness has apparently been much checked during past years by the occurrence of a destructive fire, and some other untoward circumstances. It has been recently restored to working order, and placed under the superintendence of Dr Albert Day, who was previously so efficient in the management of the Washingtonian Home; and a great amount of good is expected to result from his labours in this new and larger sphere. It is evident, however, from the number of boarders reported as annually undergoing treatment in these American asylums, that they receive all sorts of drunkards; and we fear that the good accomplished must, in a large proportion of instances, be only partial and temporary. Thus, the Washingtonian Home—which has accommodated hitherto an average of about 18 persons daily—is said to have had from 250 to 300 cases annually under treatment; so that the necessarily brief average residence of each, holds out little hope that much lasting benefit can have resulted in the cases, at least of such confirmed inebriates as we have described under the name of dipsomaniacs, and for whom we desire some legislation. Doubtless, such institutions must be of much social value, were it only in contributing, for a short time, to the greater happiness of the individual chiefly concerned; but it is only a somewhat prolonged course of physical, mental, and moral treatment under judicious control, followed by carefully extended probationary liberty, that can permanently benefit the real dipsomaniac.

The Americans appear to be in advance of us in legislation regarding the care of the person and property of inebriates; for to the magistrate, or rather judge, is committed the care and custody of all insane persons, and of all persons who are wasteful and incapable of conducting their own affairs, in consequence of habitual drunkenness; and he is empowered to provide out of their estates for their safe keeping and maintenance, and for the maintenance of their families and the education of their children. Hence it might be inferred that legal power is given to enforce the care and treatment of insane drinkers in lunatic asylums, or in reformatory asylums, such as those at Binghamton or Boston. But this does not seem to be the case; and although much good must be done to this unfortunate class of individuals under the voluntary system, an infinitely greater amount would, we conceive, be accomplished were compulsory measures resorted to in the worst class of cases, when voluntary submission is unattainable or utterly unavailing.

It is pleasing to see the freedom of legislation on this and other subjects in a new country, where antiquated precedents and prejudices do not drag the wheels of reform, and where common-sense views of social interests prevail. In Southern Australia, a great step has lately been taken in the right direction, chiefly through the exertions of Dr M'Arthy of Melbourne, who had considered with lively interest the late discussions in this country regarding the treatment of dipsomaniacs. In March last, after a full ventilation of the question, the government brought in and carried through the houses of legislature a measure placing inveterate inebriates in the same category with insane persons, and providing, in connection with a Lunacy Amendment Act, for their voluntary admission to any asylum or refuge, or compulsory control and

maintenance there, should satisfactory evidence be brought before 'the Master in Lunacy' of the necessity for the step. Ere long, our law-makers will have before them the results of this Australian tentative legislation; but in the minds of many in Scotland a conviction has long since been felt that some law is absolutely necessary to meet the case of insane drinkers; and in 1857 and 1861, our Commissioners in Lunacy gave utterance to most decided views to that effect. Some with them have thought that provisions of this kind should be embodied in a Lunacy Act; but we incline rather to the opinion, that the case requires special legislation; and that separate asylums, sanitarium, reformatories, or by whatever name inebriate institutions may be called, should be provided and licensed for this class of the unsound in mind. Interference with personal liberty would thus be more in accordance with the delicacies of the case, less painful to the feelings of those chiefly concerned, and more likely to secure the humane and remedial objects contemplated. Besides, the arrangements proposed would greatly relieve ordinary asylums, in which the dipsomaniac inmates have hitherto been confined, and in which apparently they have occasioned much trouble and annoyance, from their comparatively early return to sanity, consequent on abstinence from stimulants, while as yet they had undergone very little moral improvement; and apart from this, the malady itself could in many respects be much better treated when separated from other insanities.

Were sufficient facilities afforded, under government sanction, for the control of dipsomaniacs, and their detention until fit for liberation, we have no doubt numerous institutions—and better than those hitherto existing on voluntary enterprise—would spring up in various parts of the country, to accommodate individuals of all grades of society. Institutions so licensed, and endowed with necessary powers, would not only be productive of much public good, but be remunerative. Even supposing it necessary that government should establish three or four inebriate asylums in central situations of the country, these would soon be found to a great extent to be self-supporting, while they would assuredly lessen the burdens of the country otherwise, by the diminution of disease, destitution, and crime. Parochial boards, too, might send their inveterate drunkards into such asylums with more benefit and more economy than they can keep them in the wards of a workhouse. Into these houses, ready and immediate admission might be afforded for cases of sudden and wild delirium or mania from drink—say, on a medical certificate attested by a magistrate, justice of the peace, or clergyman; but such cases not to be detained longer than the acuteness or violence of the attack lasts, without information being given by the superintendents to the authorities appointed for this purpose, and the proper forms gone through. The other conditions of admission would be either voluntary or compulsory—the former with consent of the dipsomaniac, without a formal warrant, and residence to continue only so long as he desired it; and the latter at the instance of any friends, medical men, or other parties applying to a sheriff for the necessary powers, or at the instance of a public prosecutor, for the good of the community, supposing no other parties are found willing, or could be compelled, to take the requisite steps. All arrangements in regard to forms of application, medical certificates, sheriff's inquiry and permission, the character of the institutions to be licensed, the public and private duties of superintendents in regard to the reception, protection, care, detention, and dismissal (whether probationally

or finally) of boarders, could easily be adjusted, if the chief matters were agreed on.

There are just two other points to be brought into view so as to remove the objections which otherwise might naturally be urged against these proposals. The first is, that careful inspection of the proposed institutions should be made by commissioners appointed for the purpose, so as to see that all necessary humane and remedial arrangements are properly carried out, and that no one is detained longer than is essential for recovery; and the second is, that they, along with the medical superintendents, should decide when the inmates, although still under control, are sufficiently sane to execute any testamentary deeds, or to conduct other business matters, or to perform—under more or less surveillance of course—any external civil privilege; or when they may be allowed probational leave of absence, as a preliminary step to final liberation. These latter arrangements would do much to remove the odium connected with personal restraint, and the supposed infringement of civil privilege; and would effectually prevent any one from seeking to impose or prolong control from improper motives.

In the foregoing descriptions and remarks, we have drawn freely from Dr Peddie's papers on *The Necessity for some legalised Arrangements for the Treatment of Dipsomania, or the Drinking Insanity* (Edin., Sutherland and Knox, 1858); and *Dipsomania, a Proper Subject for Legal Provision*, read before the National Association for the Promotion of Social Science at Glasgow, in 1860. To these we refer for a fuller elucidation of the subject; and we would also specially refer to Dr Christian's admirable lecture *On some of the Medico-legal Relations of the Habit of Intemperance* (Edin., Adam and Charles Black, 1861).

DISS, a market-town of the county of Norfolk, England, on the right bank of the Waveney, 19 miles south-south-west from Norwich. It is a station on the Great Eastern Railway. The town stands on the slope of a hill; its streets are narrow, but many of the houses very good. There are brush manufactories and breweries. The church of St Mary is a large and handsome Gothic building. Pop. (1861) 3164.

DISSECTION WOUNDS. The practical study of anatomy is attended with certain dangers, which, however, during the last quarter of a century have been much lessened. The atmosphere of the dissecting-room, now comparatively pure by the application of proper ventilation and other sanitary measures, was, less than a generation ago, too commonly loaded with noxious emanations, which more or less poisoned the blood of those who continuously inhaled it, and consequently produced nausea, sickness, diarrhoea, a bad taste in the mouth, and other symptoms. Dissection wounds, which are always attended with a certain amount of risk, were rendered more dangerous by the low state of the system, induced by the depressing influence of the surrounding air. Now, probably in consequence partly of the purer air, and partly of the general and extensive use of antiseptic injections into the vessels of the subjects to be dissected, it rarely happens that severe symptoms follow a cut or puncture. We may incidentally remark that a puncture in making a post-mortem examination, when the body is comparatively fresh, is much more likely to be followed by serious consequences than a wound in the dissecting-room in which the bodies have been lying for some weeks.

In the great majority of cases, punctures or cuts in the dissecting-room are followed by no unpleasant results; it being an established rule, that every

puncture should be carefully sucked as soon as it is observed, and then freely touched with nitrate of silver. When, however, the poison has been absorbed, and is going to act, the patient begins to have a feeling of general illness in less than 24 hours. He is low-spirited, faint, and chilly, and often complains of nausea. Then come rigors, intense headache, rapid and sharp (but weak) pulse, a coated tongue, vomiting (sometimes), and great restlessness. The first local symptom is intense pain in the shoulder of the wounded side, which is followed by fulness of the neck and armpit, extending in the form of a doughy swelling down the side of the trunk, and assuming a pinkish tint.

The general symptoms increase in severity, the breathing becoming difficult, the pulse very rapid and weaker, the tongue dry, brown, and often tremulous when protruded, and the skin more or less yellow. The case may terminate fatally at or before this stage; or abscesses may continue to form, from which the patient may more slowly sink; or if he survive, the arm may remain stiff and useless, or some of the fingers may be destroyed by gangrene. In the article POISONS we have noticed the rapidity with which death occasionally ensues in these cases. The essential points of treatment are briefly summed up as follows by Dr Druitt in his excellent remarks on this subject in *The Surgeon's Vademecum*: 'The indications clearly are to eliminate the poison from the blood; to support the strength; and to relieve pain, and promote the discharge of pus or sloughs.' The treatment, both general and local, is, however, so similar to that of Pyæmia, that it is sufficient to refer our readers to that article.

As a precautionary measure in post-mortem examinations, the surgeon, especially if he be out of health, or if the patient have died from a disease of an erysipelatous character, should thoroughly anoint his hands with lard. Very thin india-rubber gloves have been recommended as a safeguard to dissectors; but they have not been found to answer; probably from the constraint to which they subject the action of the fingers.

DIVIRIGI (anc. *Tephrene*), a town of the province of Rumili, Asia Minor, on the Kurner-Su, a branch of the Euphrates, 28 miles north-west from Arabkir. Pop. supposed to be about 10,000.

DOE'SBORGH (*Druusburg*), a town in the Netherlands, province of Gelderland, lies 11 miles east-north-east from Arnhem, on the right bank of the Yssel. It was formerly fortified, but the walls have been broken down, planted with trees, and formed into pleasant promenades. An entrenched camp has been constructed on the north-east side, between the Yssel and Old Yssel, which here unite. The streets are broad, and many of the houses handsome. There are several benevolent institutions, a grammar-school, boarding-schools for boys and girls, and good public schools. The trade is considerable. Ship-building, book-printing, the making of Eau de Cologne, preparing mustard, &c., are carried on. In 1864, pop. 4064.

DO'KKUM, a town in the Netherlands, province of Friesland, lies 12 miles north-east from Leeuwarden, on the Ee (pronounced *Ay*), which cuts it into two irregular parts. Within the town is a broad haven, suited both for sea-going and inland ships. There are several regularly built streets and many neat houses. The trade in flax, cattle, wool, and chickory is extensive. In the Dokkummerdiep, shrimps are largely taken. Ship-building, gin-distilling, beer-brewing, carding wool, &c., are principal industries. There are a grammar and other good schools. In 1864, pop. 4535.

DOLINA, a town of Austrian Galicia, in the

circle of Stryi, 60 miles south from Stryi, on an affluent of the Swica, a branch of the Dniester. It has extensive salt-mines. Pop. 5974.

DÖLLINGER, JOHN J. IGNATIUS VON, one of the most distinguished of the divines and theologians of the modern Roman Catholic school of Germany, was born at Bamberg, February 28, 1799. He was educated in the episcopal seminary of Würzburg, where he received holy orders. For a short time, he engaged in parochial duties in his native diocese; but having manifested a peculiar fitness for a literary life, he was appointed professor in the seminary of Aschaffenburg, whence, in 1826, on the establishment of the new university at Munich, he was transferred as a member of the Theological Faculty, being appointed to the chair of Ecclesiastical History of that important institution. From the first, he was distinguished as a ready, no less than profound, writer. He inaugurated his new professional career at Munich by a work on *The Doctrine of the Eucharist during the First Three Centuries*, in 1826. The studies of his chair, however, lay rather in the direction of history than of doctrine; and his first essay as a historian was a volume on the *History of the Reformation*, which was designed as a continuation of the unfinished *Handbook of Church History* by Hortig. Being dissatisfied with this work, he projected an entirely new *History of the Church*, of which the first volume was published in 1833, and the second in 1835, and which was speedily translated into French, and also into English. This work, however, was only carried in its extended form as far as the 15th c.; although a compendium which came down to the Reformation, was issued between the years 1836—1843, in which years Dr D. published several other works, the most important of which, for general literature, is a very learned and suggestive essay on *The History, Character, and Influence of Islamism* (4to, 1838). A still more curious work is a large compilation in three massive volumes, entitled *The Reformation, its Internal Development and Effects* (1846—1848). The design of the work, which consists almost entirely of extracts (connected by a very slight thread of narrative) from the writings of the leading reformers, especially Germans, and of other contemporary Protestant writers, is to present, in the words of the actors in the great religious drama of the 16th c., a picture doctrinal, moral, social, and political, of that memorable revolution and of its results; but as the great body of the authorities are German, the interest of the work is mainly national, many of the names being little known beyond the limits of Germany.

For a time, having relinquished the chair of history to his friend Dr Möhler, D. undertook that of Dogmatic Theology; in which capacity he delivered lectures on 'The Philosophy of Religion,' on 'Symbolism,' and on 'Patristic Literature,' none of which, however, have been published. But he was a frequent contributor to the well-known Munich journal, the *Historisch-politische Blätter*, many of whose volumes contain articles and series of articles from his pen. He published also about the same time several pamphlets on subjects of occasional interest or of local controversy; and he was one of the projectors and (in the early volumes) chief contributors, of the well-known Catholic cyclopædia entitled *Kirchen-Lexicon*. His articles on Luther, on Bossuet, and on Duns Scotus, attracted much attention, and are distinguished by great learning and brilliancy, as well as by much moderation. In the politico-religious movement which agitated Germany in 1846—1847, D. was called to a prominent position, being elected to represent the university of Munich in the Bavarian chamber. Several of his speeches have been

published; but in the strange upturning of parties which took place in the latter year, D. was deprived of his professorship, and thus became disqualified to sit in the chamber; but in the German parliament of Frankfurt in 1848, he was restored to public affairs, and was at once recognised as the leader of the Catholic party. Most of the measures of importance bearing on the relations of church and state, which (however ineffectively) were originated in that assembly, were prepared or suggested by him. In 1849, he was restored to his professorship at Munich, and also to his place in the Bavarian chamber, which he held till 1852. Since that year, he has devoted himself entirely to theological literature. His work on the well-known *Philosophumena* of Hippolytus (q. v.), entitled *Hippolytus und Kalliclus* (1853), is a masterpiece of patristic criticism; and the still more comprehensive work called *Heathenism and Judaism, the Vestibule of the History of Christianity*, is considered the most masterly survey of the religious, moral, and social condition of the world at the advent of our Lord, which has appeared in any language. It was followed by a work in two volumes, *The First Ages of Christianity*, to which it was designed as an introduction, while the latter work itself was intended to form the introduction of the history of the development and progress of the Christian religion. In the agitation which pervaded the Catholic world during the early discussions of the question of Italian unity, D. delivered an address at Munich, which, in consequence of a hasty and garbled report, was represented by the journals as hostile to the temporal sovereignty of the pope. In order to vindicate himself from this charge, and at the same time to explain his real opinions on that important question, D. published, in 1861, an elaborate work entitled *The Church and the Churches*, which is partly a comparative survey of the social and constitutional conditions, as well of the several non-Catholic communions, as of the Catholic Church itself, and partly a *résumé* of the history and the present condition of the Papal States; the object of the writer being to shew, that while the possession of temporal sovereignty is, in the present order of things, the means providentially established for maintaining the spiritual independence of the papacy, yet such sovereignty is by no means essential; that the papacy long existed without it, and that even if it were overthrown, Providence would devise another means of attaining the same end. The second part of the work enters into a criticism of the civil and economical administration of the Papal States. The publication of these strictures is understood to have given dissatisfaction to the authorities, as being, although well meant, inopportune, and from this inopportuneness, unfriendly. A similar feeling is said to have been drawn forth by the part taken more recently by Dr D. in reference to an association of German Catholics called the Catholic Union, some of the principles of which were supposed to trench dangerously upon the province of authority in matters of religious inquiry; but his orthodoxy and learning are unquestioned, and his influence, especially among Catholics of his own nationality, is very great. In addition to his accomplishments in book-learning, Dr D.'s attainments as a linguist are very remarkable. Besides the learned languages, in which he possesses a rare mastery, he speaks and writes most of the modern languages with remarkable ease and purity.

DOLO, a town of Northern Italy, in the government of Venice, and 12 miles west from Venice, near the Venice Railway, on the Brenta and Brentano. It is a station on the railway between Padua and

Venice. In the vicinity are many fine villas of the Venetian nobility. Pop. 5523.

DO'NA, SAN, a town of North Italy, in the province of Venice, 18 miles north-east from Venice, on the left bank of the Piave. Pop. 6098.

DORCHESTER, a beautiful city of Massachusetts, U. S., on Boston Bay, four miles south-east of Boston. It contains many elegant residences, 16 churches, two banks, and manufactories of paper, iron, cotton, chocolate, and furniture, which is a large trade. The fortification of Dorchester Heights, in 1776, compelled the evacuation of Boston. Pop. in 1860, 9769.

DORÉ, PAUL GUSTAVE, a French artist of great and versatile power, was born at Strasburg in 1832. He was educated at Paris, and very early gave indication of superior ability. His first attempts were sketches, contributed to the *Journal pour l'Art* and others of the Paris periodicals. In 1855, he exhibited his picture of the 'Battle of the Alma,' which was followed by the 'Battle of Inkermann' in 1857. In this year he first became heard of in England by the reissue of his illustrations of the legend of the 'Wandering Jew,' the power of weird and grotesque imagination displayed in which could not fail to arrest attention. The success of this work might seem to have determined the future career of the artist, who has since chiefly worked as an illustrator. His productiveness in this field has been, and continues to be, amazing. His chief undertakings hitherto have been illustrated editions of *Rabelais*, of the *Contes Drolatiques* of De Balzac, of Dante's *Divina Commedia*, and of *Don Quixote*—to which must be added a vast mass of miscellaneous work. At Christmas 1866, there was issued a splendid edition of Tennyson's *Elaine*, enriched with a series of his choicest designs. He is now (1867) engaged in illustrating the Bible; and it is understood that, on the conclusion of this great work, he is pledged to proceed with *Homer* and *Shakespeare*. In addition to his work of this kind, he has, from time to time, reproduced as pictures and exhibited in Paris certain select designs from the works on which at the time he chanced to be engaged. D. is unquestionably one of the most remarkable geniuses of his time; and in 1861, he received the decoration of the Legion of Honour, in recognition of his claims as an artist.

DOUGLASS, FREDERICK, American orator and journalist, was born at Tuckahoe, near Easton, Maryland, about 1817. His father was a white man, his mother a negro slave, and he was reared as a slave on the plantation of Colonel Edward Lloyd until ten years old, when he was transferred to a relative of his owner at Baltimore. There he worked in a ship-yard, and taught himself to read and write. At the age of 21, he escaped to New York, and thence to New Bedford, in Massachusetts, where he married a woman of colour, and worked until 1841, when he attended an Anti-slavery Convention at Nantucket, and spoke so eloquently on the subject of slavery, that he was employed as an agent of the Massachusetts Anti-slavery Society, and lectured for four years with great success. In 1845, he published his *Autobiography*, and accepted an invitation to make a lecturing tour in Great Britain, where, in 1846, a contribution of £150 was made to buy his freedom. Returning to America, he established, in 1847, *Frederick Douglass's Paper*, a weekly abolition newspaper, at Rochester, New York; and deserting the extreme party of Garrison disunionists, he denounced slavery as unconstitutional. In 1855, he re-wrote his *Autobiography*, which, with the title of *My Bondage and my Freedom*, attained to a rapid sale of 20,000. Mr D. is a tall, dark mulatto; a

bold, vigorous, earnest, and fluent speaker, and a ready and able debater.

DOWNING COLLEGE, CAMBRIDGE, founded solely by Sir George Downing of Gamlingay Park, Cambridge, who, by a will of date 20th December 1717, devised his estates in the counties of Cambridge, Bedford, and Suffolk to various relations in succession, and on failure thereof, to build and found a college on a plan to be approved of by the two archbishops of England and the masters of St John's and Clare Colleges. Owing to various litigations and other difficulties, it was not till 22d September 1800 that the college received its charter, sealed with the Great Seal, nor till May 1821 that the buildings were sufficiently advanced to admit of undergraduates residing and keeping terms. The college will consist of a master, two professors (one of Law and one of Medicine), at least 8 fellows, and at least 10 scholars; but as yet only the master, professors, and 5 fellows have been appointed, the election of the remainder being deferred till the building is completed. Of the 8 fellows two must be resident, and of these one must be in holy orders; the resident fellows hold their fellowships for life, but the tenure is affected by marriage; the 6 non-resident fellows, who are presumed to be persons actively engaged in the studies of law and medicine, hold their fellowships for 12 years. This college had, in 1865, 46 members of senate, 28 undergraduates, and 90 members on the boards.

DRAINAGE-TUBES, in Surgery, are a recent but important addition to the surgical appliances for which this profession is indebted to a distinguished French surgeon, M. Chassaignac. They are composed of india-rubber, about $\frac{1}{4}$ th of an inch in diameter, perforated with numerous holes, and of various lengths. They are of great use in chronic abscesses, Empyema (q. v.), &c.; and the method of employing them is as follows: In the case of a large chronic abscess, which it might be dangerous to empty at once, the surgeon takes a long trochar (a tapping instrument such as is used to draw off the fluid in abdominal dropsy), introduces it at the top of the abscess, and brings it out as near the bottom as possible. Through the tube of this instrument a drainage-tube is inserted, which is secured in its place; the tube of the trochar being removed. Through the drainage-tube the pus oozes out, drop by drop, and the abscess is thus emptied. Like all new inventions, it has its advocates and opponents. Thus, while Mr Paget, in his article 'Sinus and Fistula' in Holmes's *System of Surgery*, says: that '*drainage*, for which the perforated caoutchouc-tube of M. Chassaignac is a very happy invention, is applicable to a great number of cases; but chiefly to those in which a sinus or incomplete fistula depends mainly on pus collecting at a level below or distant from the aperture of discharge, or more generally, when pus is apt to be retained'—Mr Paget's surgical colleague at St Bartholomew's Hospital, in his article 'Abscess,' which immediately precedes that from which we have just quoted, objects to the drainage-tube on the grounds that, as a foreign body, it sets up irritation, and adds that 'if a proper opening be made there can be rarely any occasion for a drainage-tube; and however carefully it is inserted, it must of necessity inconvenience and distress the patient.' Notwithstanding Mr Coote's objections, drainage-tubes are gradually getting into use in hospital practice.

DRAPER, JOHN WILLIAM, American chemist and physiologist, was born near Liverpool, England, May 5, 1811, and educated at a Wesleyan school at Woodhouse Grove, and later pursued his studies in

chemistry under Dr Turner of the London University. In 1833, he joined some of his relations who had emigrated to America, and in 1836, took his degree of Doctor of Medicine in the university of Pennsylvania, and was appointed Professor of Natural Philosophy, Chemistry, and Physiology, in Hampden Sidney College, Virginia. In 1839, removing to the city of New York, he was connected with the preparatory department, and in 1841, joined Doctors Mott, Patterson, &c. in founding the Medical College of New York University, in which he was at first Professor of Chemistry, and in 1850, of Physiology. He is a clear and able lecturer, and a voluminous writer, having been a liberal contributor to the *American Journal of Medical Science* and the *Edinburgh Philosophical Journal*, and published a treatise on *The Forces which produce Organisation in Plants* (4to, 1844); *Text-book of Chemistry* (12mo, 1846); *Text-book of Natural Philosophy* (8vo, 1847); *Human Physiology, Statical and Dynamical, or the Conditions and Course of Life in Man* (8vo, 1856). This work is a thorough treatise on the chemicovital theory, and profusely and admirably illustrated. Dr D. has also published *Thoughts on the Future Policy of America* (8vo, 1865).

DROYLSDEN, a large and rapidly increasing village of Lancashire, England, in the parish of Manchester, and 4 miles east from Manchester, a station on the Lancashire and Yorkshire Railway. It is situated on an elevated plain, is irregularly built, the houses of brick, but many of them very neat. The cotton manufacture is extensively carried on; there are also print-fields, dye-works, and copperas-works. Pop. (1861) 5980.

DUBU'QUE a city and port of Iowa, U. S.; on the right bank of the Mississippi, 450 miles above St Louis, built on a bluff 200 feet high, contains a city hall, market-house, U. S. custom-house, Episcopal seminary, surveyor-general's office, 14 Protestant and 3 Catholic churches and cathedral, 5 newspapers, of which 3 are German. Settled in 1788, by Julian Dubuque, a French trader, it became the centre of a large trade, and is the chief dépot of the great lead region of Illinois, Wisconsin, and Iowa. Pop. (1860) 13,012; (1865) about 16,000.

DUFOUR, GUILLAUME HENRI, a Swiss general, was born at Constance in 1787, of a Genevese family. While Switzerland formed part of France, he studied at the Polytechnic School of Paris for two years; and on leaving it, he received an appointment as an officer of engineers in the French army. At the fall of Napoleon, he entered the Swiss service, and rapidly rose to the rank of colonel. When the government survey of Switzerland was undertaken, he was appointed Director—at the same time acting as the Principal of the Swiss Military School at Thun. In 1840, he published *A Treatise on the Artillery of Ancient and Medieval Times*; and in 1842, *A Manual of Military Tactics*. In 1847, he was raised to the rank of general, and intrusted with the command of the army employed against the Sonderbund. He defeated their forces at Freiburg (13th November) and at Lucerne (24th November); and by his promptitude and skilful manœuvres, secured a triumph for the liberal party in time to prevent the interference of foreign powers, diplomatically or otherwise. The diet voted him a gift of 40,000 francs, and for a time he was the most popular man in Switzerland. His politics were not, however, those of the Genevese democrats, and in 1848 they deprived him of the public offices he had previously held. In 1856, he was again admitted to the council of Geneva, and sent on a special mission to Louis Napoleon *à propos* of the dispute between

Switzerland and Prussia about Neufchâtel (see KERN in SUPPLEMENT). In 1864, he acted as president of the conference held at Geneva relative to the treatment of the wounded in time of war.

DÜPPEL, or DYBBÖL, a small fortified town of the duchy of Slesvig, in the peninsula of Sundewitt, near the Als Sund—the strait which separates that peninsula from the isle of Alsen, and 16 miles north-east from Flensburg. During the war between Germany and Denmark, it was bombarded for more than a month by the Prussians, and finally taken, April 18, 1864.

DÜRKHEIM, a town of Rhenish Bavaria, on the Isenach, 20 miles north from Landau. It stands at the entrance of the valley of the Isenach, at the base of hills which skirt the plain of the Rhine, and the neighbourhood is very beautiful. Many invalids resort to D. on account of its amenity, and to take the *grape-cure*. It has manufactures of tobacco, cutlery, and paper. D. was formerly the residence of the princes of Leiningen-Hardenburg, whose palace was burned by the French in 1794. Not far off are the salt-works of Phillipahall. The summit of a neighbouring height is crowned by a rampart of loose stones, 6—10 feet high, 60—70 feet wide at the base, and enclosing a space of about two sq. m., called the Heidenmauer (heathens' wall), which the Romans are said to have built to keep the barbarians in check, and where Attila is said to have passed a winter, after having wrested the fortress from the Romans, when pressing on his way to Rome. Pop. (1864) 5581.

DURUY, VICTOR, historical writer, ex-professor, and Minister of Public Instruction in France, was born at Paris in 1811. Members of his family were employed as designers in the lace-works at Gobelins, and he was, in his boyhood, intended to follow their occupation. He was, on this account, somewhat late in beginning his classical studies, which he did at the College Rollin, then called the College Sainte-Barbe; but the progress he made was rapid enough to enable him to enter the Ecole Normale in his nineteenth year. Here his career was sufficiently distinguished to obtain for him, in 1833, in succession, the position of teacher of history in the College of Rheims—which he only held for two months—and that of teacher or Professor of History at Paris, in the College Henri Quatre, now the College Napoleon. This college (as well as the former) is a school of secondary instruction, in which history forms part of the programme of studies of the second (the next to the highest) class. The post which D. obtained in it was therefore by no means a high one. He continued to fill it till 1861. He had meanwhile gained a considerable reputation as a teacher of history, and as a writer on history and geography. Most of his books were school-books, but they were so good that they had a great influence upon the teaching of history in French schools. He got the degree of Doctor of Letters in 1853. In 1861 and the following year, he passed through a rapid course of promotion. He was first appointed an Academy-inspector of the Academy of Paris (an inspector of schools of secondary instruction in the district under the jurisdiction of that Academy); next, Master of Conferences at the Ecole Normale; then Inspector-general of Secondary Instruction; and, finally, Professor of History in the Ecole Polytechnique. From the last-named post he was, on the 23d June 1863, by imperial decree, advanced to the office of Minister of Public Instruction.

D., who, by activity and ability combined, had made himself distinguished while filling a somewhat humble office, was no sooner charged with the control of Public Instruction, than he began to carry

out important changes in the educational system of France—which had undergone scarcely any modification since the introduction of Guizot's Education Law in 1833. He instituted a tribunal for trying charges brought against professors. He has since remodelled the examinations for the degree of Bachelor of Letters. He first suspended, and afterwards abolished, the division of the highest class, which had prevailed in schools of secondary instruction, into two sections: the one rhetorical or literary, the other philosophical (scientific)—thus making the study of science obligatory upon all who passed through the school curriculum. He introduced other changes into the course of secondary instruction, of which the most important—at any rate, that which has been most discussed—was the teaching of contemporary history in the Lyceums or departmental public schools. Previously, the text-books used in teaching history in these schools were Bossuet's *Histoire Universelle* and Montesquieu's *Grandeur et Décadence des Romains*—these works being supplemented by the lectures of the professor. D. had a text-book prepared for their use, containing a compendium of French history to so late a period as that of the recent French invasion of Mexico; and it has been alleged that this work, and the circulars which the minister published for the instruction of teachers of history, disclosed a systematic attempt to imbue the youth of France with a Bonapartist view of recent history—to make the teaching of the schools a source of future strength to the Empire. Perhaps it would be difficult altogether to acquit D. of the Machiavelian design imputed to him. As to primary instruction, he officially proposed to the Emperor to make it compulsory and gratuitous; but the proposal was badly received by the public, and the Emperor withheld his sanction. He has, during the present year, procured legislative sanction for a measure which will greatly increase the number of primary schools, especially of girls' schools, for which the provision made had previously been inadequate. The night-schools for adults, too, have been greatly improved and extended under his care; and the educational libraries established in connection with them are proving very effective aids to the education of the working-classes. Last year, he procured an enactment for establishing schools of special secondary instruction, intended mainly to teach the elements of science to boys of the lower middle class who are to be engaged in manufactures or commerce, and, in the country districts, to give systematic instruction in the methods of agriculture and horticulture.

The matters which have been mentioned are only a few of those which D., with bold and unsparing hand, leaving no part of the system of education untouched, has dealt with since his entry upon office. It is unquestionable that he has in many cases effected improvements; but the spirit and tendency of his administration have been strongly impugned, and his conduct has been jealously watched by the best portion of French society. It is alleged that he has been steadily attempting to secure the entire control of education for the state; and to use national schools as a state instrument. For example, the changes which he introduced in the examinations for the degree of Bachelor of Letters are said to have been intended to force candidates to study at the government establishments; and they do seem, if their working has not been misrepresented, to place candidates educated elsewhere at a disadvantage. In such charges as this, there may be exaggeration or misconception; but D. is an ardent Bonapartist, and it is natural to suppose that he has intended the results which his acts are

calculated to produce. He is still Minister of Public Instruction. He was decorated with the Legion of Honour in 1845, and was promoted to be an officer of the order in 1863. He has been an officer of the Turkish order of Medjidie since 1867.

Of D.'s numerous works, not a few were written for a series published under the title *L'Histoire Universelle*, of which D. was the editor. His earliest work, *Géographie Politique de la République Romaine et de l'Empire*, first appeared in 1838; it was followed by *Géographie Historique du Moyen Age* in 1839; *Géographie Historique de la France* in 1840; and *Atlas de Géographie Historique Universelle* in 1841. In 1840, he published the first volume of a work of greater pretensions than these—*Histoire des*

Romains et des Peuples soumis à leur Domination; a second volume appeared in 1844; a third in 1853, under the title *L'Etat du Monde Romain vers la Fondation de l'Empire*; but the work appears to be still incomplete. *Histoire Sainte d'après la Bible* (1845), *Histoire Romaine* (1848), *Histoire de France* (1852), *Histoire Grecque* (1851), were among his subsequent productions. In 1862, appeared two volumes of his *Histoire de la Grèce Ancienne*, a work which has been crowned by the French Academy. *Histoire Moderne* (1863), *Histoire Populaire de la France* (1863), *Histoire Populaire Contemporaine* (1864), *Introduction Générale à l'Histoire de France* (1865), were works prepared under his direction, and some of them partly consisting of extracts from his previous writings on French history.

E

EAGRE, another name for the Bore (q. v.) in tidal rivers.

EAR, DISEASES OF THE. See DEAFNESS and OTITIS.

EAU DE LUCE is the name given to a preparation which was formerly a very popular stimulant, and is still occasionally used. It is a mixture of oil of amber with alcohol and ammonia, and has a milky appearance. It had a great reputation in cases of snake-bites.

ECRASEUR, the name of a long steel instrument, invented a few years ago by a distinguished French surgeon, M. Chassaing, and consisting of a fine chain which, passed round any structure—as the base of a tumour, for example—gradually constricts it, and finally crushes its way through it by means of a screw or rack for tightening it, which is worked at the end of the handle. The advantage of this instrument over the knife is, that it causes little or no bleeding, the torn vessels spontaneously contracting and closing. It is specially applicable to cases of cancer of the tongue, piles, polypi, and various kinds of tumours. When a solid mass—as, for example, a considerable portion of the side of the tongue—is to be removed, the chain is sometimes pressed through the centre, and made to cut two lines successively in the form of a V, in which the diseased structure is included. As the pain which is caused by this instrument is very great, the patient should be placed completely under the action of chloroform before it is applied.

ERICOK, or IORICOK, a town of Guinea, the capital of a petty chief, on the Old Calabar river, about 100 miles from its mouth. The river is here about a mile broad. The town consists of mud-houses, erected on platforms.

ECTHYMA is a pustular disease of the skin, in which the pustules often reach the size of a pea, and have a red, slightly elevated, hardish base. In the course of two or three days after the appearance of the pustule, it is replaced by a scab, which adheres firmly to the base, and is somewhat concave. On its removal, a deep red mark, a new scab, an ulcer, or a healed scar remains. The disease may be acute or chronic. The acute form is ushered in by slight constitutional, not amounting to febrile, symptoms, and by a burning or pricking pain at the seat of

the eruption, which is usually confined to the neck and shoulders. The disease runs its course in ten days or a fortnight. In chronic ecthyma, the pustules which follow in crops (often for several months) are usually scattered over the extremities. This form of eruption indicates a low state of the system. It sometimes follows the acute disease, and not unfrequently is a tertiary symptom of syphilis. Pustules, which in no respect seem to differ from those of ecthyma, are produced by various local irritants. Thus the affection of the hands, popularly known as *the grocer's itch*, is produced by the irritation of brown sugar, perhaps by the *acari* which are so often present in it. Stone-masons are said occasionally to suffer from a similar disease. With regard to *treatment*, the acute form would in most cases doubtless disappear in the course of a fortnight, if left entirely to itself; but as the bowels are usually disordered, an occasional alterative aperient, as a few grains of gray powder with a little rhubarb, may be prescribed, and tepid water applied locally gives great relief. The patient should, moreover, be kept on a moderately good, nutritious diet. In the chronic form of the affection, a meat diet and the use of wine or porter are essential; while tonics, such as a combination of bark and nitric acid, are called for. Tepid baths are often useful, and if there is sleeplessness, an opiate should be taken at or shortly before bedtime.

EDA'M, a town in North Holland, lies 12 miles north-north-east from Amsterdam. It has seven entrances, and lies within a green dyke, ornamented by two rows of elm-trees. There is an extensive trade in wood and cheese. The principal industries are ship-building, rope-spinning, sawing wood, tanning leather, &c. There are a Lutheran, a Baptist, a Roman Catholic, and two Reformed churches, one of the latter having beautiful painted windows. In 1864, pop. 5180.

E'DENKOBEN, a town of Rhenish Bavaria, in the circle of Pfalz, six miles north-north-west from Landau. It has a station on the Mannheim and Strasburg Railway. It is surrounded by vineyards, which produce much wine, but not of very good quality. Chestnuts are also produced in large quantity in the neighbourhood. There is a bathing establishment at E., also several mills and manufactures of fire-arms. It has important grain markets.

Near it are the royal villa of Ludwighohe, and the church and tower of the ruined convent of Heilsbruck. Pop. 5140.

EDUCT is a term employed in Chemistry to indicate that the body to which it is applied is separated by the decomposition of another in which it previously existed as such. It thus stands in opposition to *product*, which denotes a compound not previously existing, but formed during decomposition. Thus, the volatile oils which pre-exist in cells in the fruit and other parts of plants, and oil of sweet almonds obtained by pressure, are educts; while oil of bitter almonds, which does not pre-exist in the almond, but is formed by the action of emulsin and water on amygdalin, is a product.

EIBENSTOCK, a town of the kingdom of Saxony, in the circle of Zwickau, and 16 miles south-south-east from Zwickau. It stands in a high and bleak district. It has extensive manufactures of chemical products, muslins, lace, tobacco, and tin-ware, and a considerable trade in cattle. Medicinal plants are very extensively cultivated. Pop. (1864) 6400.

EJUTLA, a town of Mexico, in the province of Oajaca, on a small river, 250 miles south-south-east of Mexico city. It was the capital of a dep. of the same name, in the new division of the country made by Maximilian. Pop. 7128.

EKHMIM, or **AKHMIM**, a town of Upper Egypt, 53 miles south-south-east from Siout, on the right bank of the Nile, and about a quarter of a mile from it. It occupies the site of the ancient *Chemnis*, or *Panopolis*, one of the great cities of the Thebaid. Remains of ancient buildings exist. Cotton fabrics are manufactured here. Pop. supposed to be about 10,000.

EL BASSAN, **ALBASSAN**, or **ILBASSAN**, a town of European Turkey, in the province of Albania, on the Scombi, 35 miles east from the mouth of that river. It stands in a fertile plain, surrounded by mountains, is the capital of a sanjak, and the seat of a Greek bishop. It has manufactures of iron and copper wares. Pop. 5000.

ELCHO, **FRANCIS WEMYSS-CHARTERIS-DOUGLAS**, **LORD**, born August 4, 1818, is eldest son of the eighth Earl of Wemyss. This ancient Scottish family has a traditional descent assigned it from the House of Macduff, Earl of Fife. Sir Michael de Wemyss in 1290 was sent to Norway by the lords of the regency in Scotland to conduct the young Queen Margaret to her dominions. He swore fealty to Edward I. in 1296, and was a witness to the act of settlement of the crown of Scotland by King Robert I. at Ayr in 1315. From him lineally descended Sir John Wemyss, who was created a baronet in 1625; raised to the peerage of Scotland as Baron Wemyss of Elcho in 1628; and advanced to the dignities of Earl of Wemyss in the county of Fife, and Lord Elcho and Methel, in 1633. Although indebted for his honours to Charles I., he was engaged during the subsequent civil wars on the side of the parliament. David, fourth earl, was appointed by Queen Anne Lord-high-admiral of Scotland, and one of the commissioners for concluding the treaty of Union. The eldest son of the fifth earl having taken part in the rising of 1745, escaped to France after the battle of Culloden, and was attainted. At his death, the family honours were taken up by his brother Francis, sixth earl, who, having inherited the estates of his maternal grandfather, Colonel Charteris, of Amisfield, county Haddington, had assumed the surname of Charteris before that of Wemyss. Francis, his grandson, became heir to the titles of Earl of March, Viscount Peebles, and Baron Douglas of

Neidpath, on the demise of William, third Earl of March, and fourth Duke of Queensberry, in 1810. In 1821, he was made Baron Wemyss of the United Kingdom, by which title the possessor of the earldom holds his seat in the House of Lords. A parliamentary reversal of the attainer of Lord Elcho, obtained in 1826, put beyond question the succession to the Scottish honours. His son, the present earl, is Lord-lieutenant of Peebleshire, and lieutenant-general of the Royal Archers.

Lord E. was educated at Christ Church, Oxford, where he graduated B.A. in 1841. He was returned to the House of Commons as M.P. for East Gloucestershire from July 1841 to February 1846, and has sat for Haddingtonshire since 1847 to the present time (1867). He took his seat on the Conservative benches, but accepted office, with other members of the party of Sir Robert Peel, in the coalition government of the Earl of Aberdeen, and was a Lord of the Treasury from January 1853 to February 1855. In 1859, the menacing attitude of France, and the periodical recurrence of seasons of alarm, caused by the unprotected state of our shores, and the possibility of invasion, led to an organisation of Rifle Volunteers in Great Britain. In this movement, Lord Elcho took the earliest and most prominent part. He organised a regiment of London Scottish Volunteer Rifles, of which he was appointed major in 1859, and lieutenant-colonel in 1860, and went to Hythe Barracks, to receive instruction in the use of the Enfield rifle, and to the camp at Shorncliffe, in order to become familiarised with regimental duties and brigade movements. Lord Elcho also projected the National Association for the Promotion of Rifle-shooting, the first shot at which was fired by her Majesty, July 2, 1860, at Wimbledon. He and other patriotic noblemen and gentlemen associated with him in the Volunteer movement, had the satisfaction of assisting, in 1860, at two grand reviews by the Queen of various brigades of Volunteer Rifle corps—of 20,000 men in Hyde Park, and 22,000 men in Edinburgh. The War Office assisted in organising the force, and thus was consolidated the Volunteer army of Great Britain, who adopted as their motto, 'Defence, not Defiance.' The National Rifle Association, mainly under the auspices of Earl Spencer and Lord E., has become an established institution—the centre and keystone of the Volunteer movement. Lord E. has since given additional efficiency to the Volunteer movement by watching, in his place in parliament, its financial relations with the government. In 1865, Lord E. took a more active part in parliamentary politics than had been possible during his labours in promoting the Volunteer movement. He spoke against the £6 franchise proposed by Mr Baines, and gave notice of a motion for a Royal Commission to examine into the extension of the franchise. When the government of Earl Russell brought in the Reform Bill of 1866, Lord E. organised a secession from the Whig party, under the leadership of Earl Grosvenor, which was nicknamed the 'Cave of Adullam,' but which succeeded in defeating the Bill, and displacing the government. Lord Derby, on his accession to the premiership, offered a post in his government to Lord E., but the offer was declined. In 1867, his party found themselves powerless to prevent the passing of a more democratic Reform Bill than that which in the previous year they had thrown out. Lord E. is a fluent and pleasant speaker, and he is exceedingly popular with the Volunteers both of England and Scotland. He married, 1843, the Lady Anne Frederica, second daughter of the first Earl of Lichfield, who has assiduously assisted in

the great work of his life—the organisation and success of the Volunteer movement.

ELECTRIC LOOM. A reference was given in **JACQUARD LOOM to WEAVING**, for a notice of Bonelli's electric loom; having been accidentally omitted in the last-named article, the notice is inserted here. The machine is not so much a loom, as an electric appendage to the Jacquard apparatus. Although not at present brought much into use, its principle is very beautiful, and is likely to be suggestive of other applications. The apparatus will suit any Jacquard loom. The design or pattern to be woven is painted with a brush and black varnish on an endless band of paper covered with tinfoil. When in action, the band passes under a series of metallic teeth connected with a galvanic battery. Whenever the foil touches a tooth, a galvanic current is sent through them both to coils of wire surrounding small bars of iron: the bars become temporary magnets; but as soon as the varnish on the foil touches a tooth, the galvanic current and the magnetism alike cease. There are thus produced rapid alternations of action, which are made to work the Jacquard apparatus in a remarkably ingenious way. Small iron rods are placed opposite the ends of the small bars; when the latter are in a magnetic state, they attract or draw forward the former to a small distance; but when the bars are not magnetic, the rods are not attracted. The rods fill like pistons, but without tightness, a series of holes in a vertical iron plate, and are drawn a little way out of these holes whenever the bars are magnetised. Now, the pattern on the foil continually changes the contact of the foil and the varnish with the teeth; this change makes the bars alternately magnetic and non-magnetic; this, in its turn, varies the order in which the rods are drawn out of the holes; and this, finally, converts the plate into a sort of Jacquard card, with its holes partially open and partially closed, in accordance with some determinate pattern, and changing these openings and closings continually. A treadle moves the plate towards the bars, with a swinging motion; and each swing is accompanied by one throw of the shuttle. This is for one-colour thread; if there are two or more, there must be as many bands of tinfoil as colours: the arrangement is more complex, but the principle is the same. By varying the velocity of moving the band, the pattern may be made larger or smaller, and thicker or thinner in the closeness of the web; while the design may quickly be changed by substituting another strip of foil.

ELECTRO-METALLURGY. Since the writing of **GALVANISM**, many advances have been made in the art of electro-metallurgy. At that time it was nearly always the case, in electro-plating, that the silver presented a dull appearance when drawn out of the trough, requiring to be polished by a burnisher and a scratch-brush. Messrs Elkington have, however, devised a mode of causing the galvanic action to polish the metal. If bisulphide of carbon be added to the bath, or, better, if the article be dipped into a bath containing this liquid after immersion in the usual acid solution of silver, a thin but hard and bright layer of silver is deposited on the main layer, brilliant enough to do without polishing. There are certain difficulties in the process which render it only applicable under some circumstances.

Both copper and brass are now made by electricity. Messrs Elkington have a plan for bringing copper ore, by the usual processes, to that degree of refining called 'pimple' or 'blister' copper; after which the rest of the operation is performed by

electricity. The pimple copper is cast into plates eighteen inches square by three-quarters of an inch thick, one of which is used to form the positive pole in a battery; the negative pole being a very thin sheet of pure refined copper, about one-thirtieth of an inch in thickness, and perhaps twelve inches by six. This thin plate forms the basis on which any amount of pure copper may be deposited. Particles of pure copper, by the electric action, separate themselves from the crude plate of pimple metal, and attach themselves to the thin plate of pure copper. By this means plates twelve inches by six, and an inch thick, are produced, fitted to use in various ways for casting or rolling. The metallic impurities of the pimple copper fall down as a residue, which has a value for some purposes.

M. Heeren, of Hanover, makes brass by electro-deposit. Brass is a compound of copper and zinc, and he brings these two elements together in the trough. An article of any kind, which is to be covered with brass, is placed in a hot solution containing, among other chemicals, sulphate of copper and sulphate of zinc; and an electric current is sent through the bath. As copper is more electro-negative than zinc, and separates more easily from its solution, the deposit would be wholly of copper under average circumstances; but by adopting means to retard the action of the copper, and accelerate that of the zinc, the two metals are deposited in the proportion to constitute brass. Mr Bradbury has invented a mode of depositing pure zinc on an engraved copper-plate, with such exquisite thinness and regularity as to preserve all the fine lines of the engraving. In one hour a layer may be thus applied, from which fifteen hundred to two thousand impressions can be taken; and then it may be stripped off, and a new layer deposited. The object held in view is, to multiply greatly the number of impressions that may be taken from any one engraved copper-plate.

The manufacture of electro-plate has now become a very large and important branch of industry, chiefly at Birmingham. Cups and competition trophies for all kinds of contests; presentation plate, dinner services, tea and coffee services in various degrees of completeness; forks and spoons, cruet-stands, liquor-stands, nut-crackers—are now made of electro-plate, in immense quantities; a thin layer of pure silver being deposited on a foundation of nickel, German silver, or some other white metal.

The making of large copper or bronze statues by electricity instead of by casting, is another department of the art which is making great strides. Between the years 1861 and 1866, Messrs Elkington produced in this way statues of Crompton, Goldsmith, the Queen, the Prince Consort, Lord Hill, Mr Fielden, Lord Howe, General Murray, Lord Hopetoun, Lord Combermere, General Seaton, and the Earl of Eglintoun, varying in height from 6 feet to 13½ feet. The last-named colossal statue, that of the Earl of Eglintoun, weighs two tons. There is a trough or deposit-tank at the works of this celebrated firm, 15 feet long, 9 feet wide, and 9 feet deep, that will contain 6600 gallons of acid solution.

The French are also making great progress in the art. M. Oudry has taken electro-casts of the bas-reliefs on Trajan's column at Rome, covering 700 square yards. He has also coated many thousands of the iron lamp-posts of Paris with copper by electro-deposit, as well as numerous fountains, &c., producing most of the good effects of bronze at a much smaller expense.

ELECTROPHONE, an instrument devised by Dr Strethill Wright for producing sound by electric currents of high tension. In its simplest form, the

electrophone consists of two metallic plates separated by a sheet of cartridge-paper, the whole being closely pressed together by a heavy weight or screw. Such an instrument, when its plates are connected with the terminals of a small induction-coil, forms a sonorous condenser, the note of which varies with the rapidity of action in the electrotope or contact-breaker. The more complicated electrophone communicated to the Royal Scottish Society of Arts, 25th April 1864, by Dr Wright, of which a diagram is shewn in fig. 1, is composed of four curved plates of the thinnest sheet-zinc, each two by four feet, arranged as in the figure, and each separated from its neighbour by a double layer of imitation silvered paper, the silvered sides being in apposition to the zinc. The plates 1 and 3 and 2 and 4 are connected by fine wires, *c* and *d*, which also connect the instrument with the induction-coil. When this instrument is connected with a small coil, the terminals of which afford a spark almost inaudible, it becomes charged and discharged with each impulse of current, each charge being attended by a sonorous tap given out by the whole mass of metal thrown into vibration, and the rapid succession of taps producing a prolonged trumpet-note, the power of which may be increased by adding battery-power to the coil. The electrophone has been recommended by its author for use as a telegraphic relay capable of giving two or four signs with a single wire, with

Fig. 1.

the advantage over other relays that perfection of contact was not necessary to its working. Fig. 2 shows the mode of working the electrophone as a double relay with four signals and the galvanometer of Thomson;

Fig. 2.

table instrument to report to a large audience results of processes which can only be rendered sensible by the most delicate galvanometric apparatus. Thus, the effect of acids and salts on the conductivity of water and flame, the retarding effect of diaphragms and of distance in various solutions between the elements of the voltaic pile, and even the most difficult of all experiments, the determination of the slightest variation in the electric equilibrium of muscle and nervous tissue,

may be indicated in loud and varying tones by the chemist and physiologist to his class, and phenomena hitherto only perceptible to a single close observer may be rendered manifest to the thousands who crowd the lecture-rooms of popular scientific institutions. Fig. 3 shows the adaptation of the

Fig. 3.

electrophone to the galvanometer. *AB* represents the needle of the galvanometer suspended by a silk fibre, *C*; *D* is a small vessel of mercury communicating by a fine wire with the centre of the needle; while a similar wire, attached to the end of the needle *B*, dips into the curved trough *EF*, containing distilled water. The wires inserted into *D* and *F* connect the coil with the electrophone, the current passing through *F*, *E*, *B*, *D*. When the needle is deflected, the tract of water between *E* and *F* is shortened, and the electrophone gives forth a gradually increasing sound. By a delicate system of levers attached to the wrist, as in the Sphygmograph (*q. v.*), the rhythm and character of the human pulse, and its variation in disease, may be indicated to the class by the physician. Further, the electrophone may be adapted to the telephone by placing the primary wire of the induction-coil in connection with the membrane of the latter instrument (see TELEPHONE), and thus a song gently sung in one place may be repeated in trumpet-tones in another hundreds of yards distant.

ELEPHANTIASIS is a term applied to two varieties of skin-disease, in which the limbs, from their enlargement, and from the changed condition of the skin, have a slight resemblance to those of the elephant. There is the *elephantiasis of the Greeks*, which is usually regarded as the same as the eastern leprosy, and as the *spedalskhed* of Norway; and the chief features of which are described in the article **LEPROSY**. In this affection, the size of the limbs and the state of the epidermis are comparatively slightly altered. In the *elephantiasis of the Arabs*, which seems to be identical with the *Barbadoes Leg* (*q. v.*), there is great enlargement of the affected parts, and the skin is much thickened.

ELLEZE/LLES, a large village of Belgium, in the province of Hainaut, 16 miles north-east from Tournay. Linen-weaving is extensively carried on. There are several flour-mills, breweries, and a salt-refinery. Pop. 5468.

ELLIS, WILLIAM, an English missionary, born in the latter part of last century. In January 1816, he sailed with his wife for the South Sea Islands, as a missionary of the London Missionary Society, and laboured there for nearly ten years. He set up in Tahiti the first printing-press in the South Sea Islands. In 1824, he returned to England, on account of the illness of his wife. He was for some years employed at home in the business of the London Missionary Society. In 1826, he published a *Narrative of a Tour through Ouhayhes*; and in 1829, *Polynesian Researches*, 2 vols. In 1839, he published

a *History of Madagascar*, 2 vols., compiled from government papers, and information received from missionaries. In 1835, his wife died, and two years afterwards he married Miss Sarah Stickney, who for many years conducted a school for girls at Hoddesdon, in Hertfordshire, and who is well known as the authoress of many popular works, among which are *The Women of England* (1838), *The Daughters of England* (1842), *The Wives of England* (1843), *Hearts and Homes* (1848—1849), and *The Mothers of Great Men* (1859). Her works are all of an excellent moral and religious tendency, and have been very widely circulated both in Britain and America. She was educated among the Society of Friends, to which her parents belonged.—In 1853, Mr E. was sent to Madagascar by the London Missionary Society, to inquire into the state of things in that island, and particularly into the condition and prospects of the Christians there. In 1859, he published an interesting and valuable work, entitled *Three Visits to Madagascar, during 1853—1856, with Notices of the People, Natural History, &c.*, a work to which we are largely indebted for our present information concerning that island. In his *Poly-nesian Researches*, as well as in this work, Mr E. gives much information concerning the inhabitants, scenery, and productions of the countries which he visited, and few works of greater general interest or higher value have come from the pens of modern missionaries. In 1867, he published another work, the nature of which sufficiently appears from its title, *Madagascar Revisited, describing the Events of a New Reign, and the Revolution which followed, setting forth also the Persecutions endured by the Christians, and their Heroic Sufferings, with Notices of the Present State and Prospects of the People.*

ELSSLER, FANNY, a celebrated danseuse, was born in 1810 at Vienna, where she received her early training, and appeared at the age of seven on the boards of the Kärntner Thor Theatre. Along with her sister Teresa, she went to Italy to complete her education in 1827. On their return, the two sisters were received with immense enthusiasm in Berlin, Vienna, Paris, St Petersburg, and London; Mademoiselle Fanny more especially, who, by her wonderful dancing of 'La Cachucha,' was considered to have almost eclipsed Tagliioni. In 1841, both sisters excited, if possible, a greater furor in America. Returning millionaires, F. E. retired to a villa in the neighbourhood of Hamburg, while Teresa entered into amorganatic marriage with Prince Adalbert of Prussia.

EMBOLISM (derived from the Greek word *embolon*, a plug) is the term employed by recent pathologists to designate the plugging-up of a vessel by a clot of coagulated blood-fibrin, by a detached shred of a morbid growth from a diseased cardiac valve, &c. It is in cases of ill-nourished, broken-down constitutions, or after a protracted or a debilitating illness, that the morbid tendency of the fibrin to coagulate spontaneously within the veins chiefly exists, and in such cases very trivial circumstances may call it forth, especially if they lead to any pressure on the vessel. Clots, or portions of a clot, may be transported by the blood-current from the venous system to the right side of the heart, and block up the pulmonary artery either entirely or in part: if the occlusion is entire, sudden death is produced; while, if it is only partial, gangrene, or inflammation of a part of the lung, commonly ensues. Many of the sudden deaths of women in child-bed (till recently quite inexplicable) are due to this cause, the plug being formed in the inflamed uterine veins, or possibly, in some cases, in the right side of the heart, and passing from thence to

the spot where its arrest proves suddenly fatal. Several cases of this kind are reported in Simpson's *Obstetric Memoirs*. Similar accidents may happen in the arterial system. A detached fragment of a diseased tricuspid or aortic valve of the heart, or a separated fragment of coagulated fibrin, may be driven onwards in the blood-current, and enter and occlude some of the cerebral arteries, causing softness of the brain, by cutting off the due supply of nourishment. For further details, the reader is referred to an exhaustive treatise on this subject published a few years ago by Cohn, entitled *Ueber embolischen Krankheiten*.

EMETINE is the alkaloid which forms the active principle of ipecacuanha root. It is a yellowish-white powder, which is slightly soluble in cold water, but dissolves readily in alcohol. When taken internally, it exhibits violent emetic properties, 1/10th of a grain being sufficient to cause vomiting.

EMMANUEL COLLEGE, CAMBRIDGE, was founded in 1584 by Sir Walter Mildmay, Chancellor of the Exchequer and privy-councillor in the reign of Queen Elizabeth. The foundation fellowships are 12 in number (to be increased to 13 when there are sufficient funds), and are open to all her Majesty's subjects who are members of the Church of England and hold the degree of B.A. All the foundation fellows are obliged to proceed regularly to the further degree in Arts, Law, Medicine, or any other faculty they have selected. There must be four of them always in priest's orders; and any who are not tutors or bursars in the college, are bound to be in orders at the end of the seventh year of their fellowship, at the risk of forfeiting it three years afterwards. The college also possesses two fellowships and four scholarships on Sir Wolstan Dixie's foundation (but the Dixie fellows have no voice in college affairs, nor any claim to the offices or dividends of the college); 12 scholarships of £60 a year, paid from the general revenues of the college; five of £30 a year, founded by Dr Thorpe; other five of the same value, founded by various benefactors; and other five (of £50, £32, £16, £12, and £10), for which candidates from certain schools have a preferable claim. The patronage of the college consists of 24 benefices, situated in the eastern and south-western counties of England; and of two schools, one in Norfolk, and the other in Suffolk. In 1865, this college had 260 members of senate, 63 undergraduates, and 404 members on the boards.

ENCEPHALOCE'LE (derived from the Greek *encephalon*, the brain, and *cele*, a tumour) is the term applied to a tumour projecting through the skull, in one of the parts where the bones are incomplete in infancy, and consisting of a protrusion of the membranes of the brain, containing a portion of brain itself. The most common situation of such tumours is in the middle line and at the back of the head. Surgical interference is scarcely ever justifiable, and all that can usually be done is to give uniform support to the tumour, and to defend it from injury.

ENCHONDRO'MA is the term employed in Pathological Anatomy to signify an abnormal cartilaginous growth. These growths most commonly occur in connection with the bones, and they are not unfrequent in some of the glandular structures. See TUMOURS.

ENCUMBERED ESTATES' COURTS. See INCUMBERED ESTATES' COURTS IN SUPPLEMENT.

ENDERMIC AND HYPODERMIC METHODS OF TREATMENT. These terms are, as the names imply, used to designate certain methods of making the skin an agent for the reception of

medicines. The endermic method consists in raising a blister by the ordinary process, opening it by a small puncture, which must not be at the lowest part of the bladder, gently pressing out the fluid contents, and then injecting a medicinal solution, by means of a small syringe, through the puncture into the emptied sac; or, if the medicine is in the form of powder, it may be scattered over the raw surface. The endermic method is now almost entirely superseded by the hypodermic method, in which medicines are introduced into the subcutaneous cellular tissue by means of a very finely pointed syringe. For the invention of this process, the science of medicine is indebted to Dr Alexander Wood of Edinburgh. It is chiefly, but not solely, to anodynes that these methods are especially applicable. It has been found that morphia given by Dr Wood's method acts more speedily and more powerfully than when given by the mouth: moreover, the medicine given in this way does not disturb the functions of the stomach, and may be administered in those cases of irritation of that organ in which medicines introduced into it would be rejected by vomiting. A solution of acetate of morphia, carefully freed from any excess of the acid, and of such strength that three minims shall contain one-third of a grain, is commonly employed, the dose varying from one to three minims, or from one-ninth to one-third of a grain of the salt. If the general effects of the morphia (as relief of pain and sleep) are required, any convenient part of the body, as, for instance, the fore-arm, may be selected: the skin, pinched up between the fore-finger and thumb of the left hand, is penetrated by the point of the syringe, and the solution injected. When a local action is required, as in the case of various forms of neuralgia, the solution should be injected as near as possible to the seat of pain. As some patients are remarkably susceptible to the action of morphia administered in this method, it is advisable to begin with the smallest of the above-named doses.

A scientific committee appointed by the Royal Medical and Chirurgical Society of London to investigate the physiological and therapeutical effects of the hypodermic method of injection, have just sent in their Report, which was read in June 1867. Amongst the most important *physiological* facts which were observed, the following may be especially mentioned. Watery solutions of drugs subcutaneously injected were far less rapid in their action than when they were introduced into a vein. On comparing the effects of medicines subcutaneously injected with those produced when they were administered by the mouth, or by injection into the lower bowel, it was found that, in the case of some drugs, the local action was different according to the mode of administration, although the general effects produced were of the same kind. Thus, aconitine given by the mouth affected the salivary glands; when given by the rectum, it caused irritation of the gut; and when given by the skin, it occasioned local pain. The smallest dose fatal to rabbits was, by the mouth, $\frac{1}{100}$ th, by the rectum, $\frac{1}{30}$ th, and by the skin, $\frac{1}{100}$ th of a grain: it was thus five times as energetic when given subcutaneously as when given in the most usual way. The effects of morphia when injected under the skin were also more rapidly manifested and more intense than when given by the mouth or rectum. A solution of podophyllin, which, when administered by the mouth, acts as a powerful cholagogue (bile-provoking) aperient, when injected into the skin, gives rise to free action of the kidneys. The investigations of the *therapeutic* value of this mode of administering drugs were limited by the fact, that many substances (aconitine, for example) give

rise to great local irritation when used subcutaneously. In cases of simple neuralgia, atropine was found to have a very beneficial effect when thus given, and in some cases more permanent relief followed its injection than that of morphia. The value of the latter drug was found to be much increased by this method, the required action being of longer duration, and being produced with greater rapidity and intensity. The same advantages followed this mode of giving quinine in intermittent fevers, but some caution is requisite in giving large doses, as irritation may arise from its presence under the skin. Amongst the conclusions at which the committee arrives are the following: (1) That, as a general rule, only clear neutral solutions of drugs should be employed, decidedly acid or alkaline solutions being apt to cause irritation, and even local ulcers, at the point of application; (2) that, as in the case of podophyllin, symptoms are observed to follow the administration of some drugs by the skin, which are wanting when the same drugs are otherwise administered; and (3) that the advantages to be derived from this method of introducing drugs are (a) rapidity of action, (b) intensity of effect, (c) economy of material, (d) certainty of action, (e) facility of introduction in certain cases, and (f) in some drugs, the avoidance of unpleasant symptoms.

ENDRÖD, a large village of Hungary, in the county of Bekes-Csanad, on the Körös, 90 miles east-south-east from Pesth. Pop. 7519. The surrounding district produces much corn, wine, flax, honey, and cattle.

ENSCHEDÉ, a town in the Netherlands, province of Overysel, lies about four miles from the Hanoverian boundary, and 30 miles west-north-west of Zutphen. Besides fustians and dimitics, cottons for export to Java are largely manufactured. Cotton-spinning, bleaching, dyeing, and calendering also employ many of the inhabitants. There are several benevolent institutions, a Reformed, a Roman Catholic, a Baptist Church, a Chamber of Trade, and grammar-school, in which French, English, and German are taught. In 1864, pop. 4664.

EÖTVÖS, JOSEPH, BARON, a Hungarian writer, born September 3, 1815, in Ofen. He received an excellent education in his parents' house, and (1825—1831) studied philosophy and law at the university of Pesth. After passing as advocate in 1833, he entered on a professional career, which he, however, soon abandoned, in order to devote himself entirely to literature. As early as 1830, he began to publish several works—viz., the comedies *Kritikusok* and *Házasságok*, and the tragedy *Boazé*, which met with great approbation. After his return from a journey through Germany, France, England, Switzerland, and the Netherlands, his work on *Prison Reform* (Pesth, 1838) appeared, which called forth an entire literature, and gave the impulse to numerous reforms of this kind in Hungary. This was followed by his novel, *The Carthusian* (Pesth, 1838), which took its place as one of the best productions of Hungarian literature. The excitement which arose with Kossuth's appearance in journalism drew E. also into the arena; and his defence of Kossuth, *Kelet népe s' a Pesti Hírlap* (Pesth, 1841), against Széchenyi in the contest between these two leaders, surpassed even Kossuth's writings in clearness and skilful reasoning. When the liberals, in 1844, split into Municipalists and Centralists, E. became one of the most eloquent advocates of the latter. His articles on this subject, published in the *Pesti Hírlap*, distinguished for their varied knowledge, richness of thought, and eloquence of style, appeared collected under

the title *Reform* (Leip. 1846). About this time, too, appeared two large novels, *A' Falu' Jeggzöje* (The Village Notary, 3 vols., Pesth, 1844—1846; Ger. by Mailath, 3 vols.; 2d ed., Pesth, 1851) and *Magyarország 1514-ben* (Hungary in 1514, 3 vols., Pesth, 1847—1848; Ger. by Dux, 3 parts; Pesth and Leip., 1850), of which the first describes, with masterly truthfulness and vividness, the country life of the present time; and the latter, the rising of the peasantry of the Dózsa in 1514. After the revolution of March 1848, he was appointed Minister of Public Worship, but fell far short of the expectation entertained of him, as, being too little a man of action, he was not fit to cope with the stormy times. He left the country even before the dissolution of the Bathyanyi ministry in August 1848, and went to Munich, where he stayed till 1851, occupying himself exclusively with literary studies. The most important fruit of his labours of this period is, *The Influence of the Ideas of the 19th Century on the State and Society* (Hung. and Ger., Pesth and Vienna, 1851). Besides which, he published in the German language, *Die Gleichberechtigung der Nationalitäten* (The Equal Rights of Nationalities, 2d ed., Vienna, 1851). Since the middle of 1851, E. has again lived in Hungary, and when he has taken part in politics, it has been as an adherent of the policy of Deak (q. v.). His anonymous publication, *Die Garantien der Macht und Einheit Oesterreichs* (Leip. 1859), made a great noise, and went rapidly through four editions. In 1865, E. began a weekly political paper, and in the same year published a work on the question of Nationalities.

EPIDEMIC CEREBRAL MENINGITIS is a disease which has been noticed and described by many American physicians since the year 1811, when Dr North specially drew the attention of the profession to it. In 1838—1840, it appeared in France, and committed great ravages in Versailles, where the mortality was 28 per cent.; in Strasbourg, where the mortality was 42 per cent.; in Lyon, Nancy, and other garrison towns. The patients, in these cases, were almost entirely young conscripts; and the disease was regarded as non-infectious. In the spring of 1846, it appeared in the Dublin and Belfast workhouses, boys under 12 years of age being the only victims, while girls under similar circumstances escaped; it likewise appeared in the constabulary depôt, in the same year, amongst the recruits. In 1863, it was very fatal in the United States. In 1865, it ravaged West Prussia: of 2000 cases recorded, half died; and of 347 cases, 330 were under 14 years of age. In this epidemic, no mention is made of the purple spots which have excited such alarm in Ireland; and in the United States, two forms of the disease are recognised—one marked by shock, weak pulse, purpled limbs, and coma, death happening within the first day; the other presenting signs of cerebro-spinal mischief, such as tetanoid spasms, and death here occurring in three days. Purple spots were present in 27 out of 44 cases.

We now pass to the consideration of the so-called *Black Death*, which, during the last and the present year, 1866 and 1867, has caused such intense alarm in Ireland, and especially in Dublin. The history of this disease is as follows: A healthy medical student, aged 19, residing in Dublin, fell ill with chilliness and *malaise* about noon on March 18, 1866. When he was visited in the evening, it was found that he had vomited frequently and was very prostrate; purple blotches appeared on his skin during the night, and about noon next day, he suddenly fell into stupor, and was dead at two, or about 26 hours from the apparent commencement

of the symptoms. Drs Stokes and Benson, who, with Mr Croly, saw the case, at once recognised it as presenting a novel type of disease. A girl, aged 18, presented similar symptoms on April 2, but recovered. Fatal cases were recorded on May 12, 13, and 17. According to Dr Mapother—from whose excellent Report 'On the Malignant Purple Fever Epidemic in Ireland,' read before the Epidemiological Society in July 1867, the materials of this article are almost entirely drawn—it appears that 63 fatal cases have been registered (up to July) in the Dublin district, exclusive of eight deaths amongst soldiers. This able physician gives the following description of the symptoms, which include two types of very different severity, and in this respect he agrees with the American observers. In the graver, life is rapidly extinguished as if by a blood-poison; in the milder, the symptoms are those of inflammation of the cerebro-spinal axis, or its membranes. Dr Stokes, however, regards these latter phenomena as secondary to the essential disease, and believes that they will always appear, if the patient lives long enough for their development. The earliest symptoms are chilliness and a sense of impending danger, and vomiting of a persistent character soon follows. There is constipation till shortly before death, when the evacuations are involuntarily discharged. The tongue is dry; the pulse abnormally compressible, and usually over 100. The dark purple blotches, caused by the escape of dissolved hæmatin (colouring matter of the blood) from the smaller vessels, are situated in and under the true skin of the legs, hands, face, back, and neck. These patches vary in size from that of a pin's head to that of a walnut, and are often sufficiently raised to be detected by the touch. The skin is dusky and moist, sometimes even bathed in sweat. In some cases, stupor, and in others, delirium and intense restlessness, are the forerunners of death. The rapidity with which this disease runs its course is appalling. A healthy boy, aged 10½ years, sank in less than five hours from the time of his seizure; and of 41 investigated fatal cases, 14 terminated within 24 hours. Of these cases, 21 were females, and 20 males. Youth predisposes very strongly to the disease. No position in life affords exemption: one young nobleman, three medical students, two undergraduates, and several inhabitants of the lowest hovels—the seats of typhus and cholera—were amongst the victims.

With regard to treatment, almost every kind has been tried, and each has been found equally unavailing. The external application of cold to the spine and head, as advocated in various forms of disease by Dr Chapman, deserves a trial. Dr Mapother suggests that the disease is due, like scurvy, to the want of fresh vegetables as an article of food; and if this view is correct, it is satisfactory to feel that if this terrible malady is incurable, it is at all events preventable. A few cases of this disease have been recorded as occurring during the last few months in various parts of England. They would probably have passed unnoticed but for the Dublin epidemic.

EQUINIA, or GLANDERS. In the body of this work, glanders has been considered simply as a disease peculiar to animals, and especially the horse. We shall here consider it as a disease affecting man, to whom it is transmissible from animals. It is remarkable that although the disease in the horse and ass has been recognised from the time of Aristotle (who describes it as common in the ass), it was not till the year 1810 that Waldinger of Vienna drew attention to the fact, that special precautions should be taken in the dissection of horses affected with glanders and farcy, inasmuch as the most serious and often fatal consequences might arise

from the inoculation of the morbid matter. Strangely enough, however, he does not seem to have noticed that the disease thus induced in man is identical with that of the horse; and it was not till 1821 that Schilling recognised this important point. It was not till a living physician, Dr Elliotson, published his Memoir *On the Glanders in the Human Subject*, in 1830, that the attention of the medical profession in this country was directed to the subject. In 1837, Rayer, in his Memoir *De la Morve et du Farcin chez l'Homme*, collected all the cases that had been observed up to that date, and gave a complete description of the various forms of glanders both in the horse and in man; and in 1843, Tardieu published his investigations, *De la Morve et du Farcin Chroniques*. It is to these writers and to the brothers Gangee ('Glanders—Equinia,' by Arthur Gangee, M.D., and John Gangee, in Reynolds's *System of Medicine*, vol. i. 1866) that we owe almost all our knowledge of this terrible disease.

In the great majority of cases, the disease is transmitted from the horse, the ass, or the mule to man; but several instances have been recorded in which it has been transmitted from one human being to another. The disease is no doubt generally due to inoculation, but the virus is also probably capable of being absorbed by unbroken mucous membrane. Most of the recorded cases have occurred in men of good constitution and in the prime of life. The four varieties of this disease which occur in the horse have also been observed in man—viz., (1) Acute Glanders, (2) Chronic Glanders, (3) Acute Farcy, and (4) Chronic Farcy.

Acute Glanders is the commonest form. The period of inoculation ranges, in the majority of cases, from three days to a week. If there is a distinct wound or abrasion through which the poison has been absorbed, the parts around the broken surface become red, tense, and painful, often before the appearance of any of the constitutional symptoms, such as a general feeling of illness, great depression of the spirits, headache, rigors, increased rapidity of the pulse, and pain in the joints. A characteristic pustular eruption, often accompanied by bullæ or blebs, appears on the face and limbs; and abscesses frequently occur on the face and about the principal joints. A yellow, purulent, fetid discharge, often mixed with blood, exudes from the nasal mucous membrane, which is invariably the seat of a pustular eruption, or of ulcerations. The prostration which is observable from the beginning increases during the course of the disease. The pulse becomes weak and frequent, the breathing difficult, the voice feeble, and the bowels very relaxed, the stools being extremely fetid. Delirium now sets in, which is followed by coma and death. Death usually occurs about the end of the second week, but the duration of the disease has been known to vary from three to fifty-nine days.—*Chronic Glanders* is so rare an affection in man that it hardly requires notice. The course of the disease usually extends over several months; and only one case of recovery is reported.—*Acute Farcy* seems only to differ essentially from acute glanders in the fact of there being no affection in the mucous membrane of the nostrils. The cutaneous eruption may or may not be present; in the great majority of cases, it is present, and the disease then follows exactly the same course as glanders. When there is no eruption, there is merely an inflammation of the lymphatic vessels and glands, or *Angioloecitis* (q. v.), accompanied with the formation of soft subcutaneous tumours at various parts. This form of the disease often terminates favourably, or may merge into *Chronic Farcy*, which is characterised by the formation of an abscess on the forehead or elsewhere,

which is followed by indolent and fluctuating tumours, which follow one another in various parts of the body, open spontaneously, and form very intractable ulcers. The disease usually runs its course in about a year. Of twenty-two cases recorded by Tardieu, six recovered.

Little need be said regarding treatment, since no remedies have been found to exercise any influence in checking the course of acute glanders. Arsenic, combined with strychnia, has been found useful in chronic glanders in the horse, and is recommended by the brothers Gangee as worthy of trial in man; and some relief might probably be afforded by the application of weak injections of carbolic acid into the nostrils.

ERCKMANN—CHATRIAN (EMILE ERCKMANN and ALEXANDRE CHATRIAN), two French men of letters, the first of whom was born 20th May 1822 at Phalsbourg; the second, 2d December 1826, in the village of Soldatenthal, commune of Abreschwiler, both in the dep. of Meurthe—one of those departments of France which formed part of the old duchy of Lorraine. E., the son of a bookseller, went through a rather irregular course of study at the college of his native town, went to Paris in 1842 to study law, which he broke off several times, and only passed his third examination in 1857, and finally abandoned the study in the following year. During the interval, he had set himself to make a name in literature, in co-operation with M. Chatrian. The latter, belonging to an old family of glass-makers in Meurthe, ruined by reverses in trade, was acting as tutor at the college of Phalsbourg, when in 1847 he was introduced to M. Erckmann. From that time the two friends employed their pens in the same works, which they signed with the two names united in one; and it was only about 1863 that the authors informed their readers that the numerous works of fiction, which had obtained a widespread popularity, and were supposed by the general public to be the work of a single writer, were the fruits of their friendly collaboration. Their early works attracted comparatively little notice; and it is said that their first work was rejected by all the newspapers of Paris, and by many provincial journals. In 1848, they published several feuilletons in the *Démocrate du Rhin*, which had just been started: *Le Sacrifice d'Abraham*, *Le Bourgmestre en Boutelle*, &c., which they have since published separately. At the same time they wrote a drama, *Le Chasseur des Ruines*, for the Ambigu-Comique, which the theatre accepted, subject to changes, which they refused to make. They produced another drama, *L'Alsace en 1814*, for the theatre of Strasbourg, which was suppressed by the prefect on the second representation. They wrote numerous novels at this time for different journals, some of which were very little noticed, while others remained in MS. for years. Despairing of being able to live by their pens, E. recommenced his law studies, and C. obtained a situation in the office of the Eastern Railway. It was not till 1859 that *L'Illustré Docteur Mathéus* (1859, in-18; 3d edition, 1864), published by the Librairie-Nouvelle, gave a certain éclat to the collective name of Erckmann—Chatrian. Since then, they have written a great many novels and tales; and their reputation as romance-writers has steadily increased. The secret of their success lies in their having faithfully depicted the manners of the simple, hardy, and warlike population of their native province. *Le Fou Yégo* (1862, in-18) is one of a series of novels, the subjects of which are taken from their national history, and gives a picture of the invasion of 1814. Yégo, as the name indicates, is a madman, whose hallucinations are brought in to explain

the marvellous in the tale. *Le Concert de 1813* (1864) and *Waterloo* (1865) are fragments of an autobiography, and are supposed to be the recollections of a common soldier, and relate the disastrous campaigns of 1813 and 1814. These may be called the gems of their collection. *Le Joueur de Clarinette* (1863), a simple story of a village musician, and *Les Amoureux de Catherine*, another tale of village life in the same volume, are nearly perfect. The last work of MM. E. and C., *L'Homme du Peuple* (1865), is less favourably spoken of as a work of art. It pictures the life of the modern French workman, with political discussions from his point of view.

ERNST, HEINRICH WILHELM, an eminent violinist, born at Brunn, in Moravia, in 1814. He early became a pupil of the Vienna Conservatorium, studying under Seyfried and Mayseder. At the age of 16, his talents excited much interest on his appearance in public at Munich, Stuttgart, and Frankfurt; and he soon afterwards performed in Paris. His first visit to London was in 1843; and he returned in subsequent years, spending the intervals in Paris and in different parts of Germany. His playing was characterised by immense brilliancy, combined with passion and sentiment. He suffered much from acute neuralgia, which latterly interfered with the exercise of his art; and the last seven years of his life were spent at Nice, where he died, October 8, 1865. E.'s compositions have generally a bravura character, and include works for the violin and orchestra, quartets, &c.

ESCHWEILER, a town of Rhenish Prussia, in the circle of Aachen, and nine miles east-north-east from the city of Aachen (Aix-la-Chapelle), is a station on the railway between Aix-la-Chapelle and Cologne, and stands at the confluence of the Inde and Dente. It has extensive manufactures of ribbons, woollens, canvas, needles, iron-wire, and machinery, also of wax-cloth, lace, glass, vitriol, and vinegar. In the vicinity are mines of zinc and lead. Pop. 13,737.

ESKAR, a term applied in Ireland to certain objects in the superficial drift, which occur in several parts of that country, and are not unknown in Scotland, but which are more abundant in Sweden than in any other known country, being there recognised as *tear*. An *eskar* is generally a long linear ridge of rounded gravel, including pieces of considerable size; in Sweden, they often have rough erratic blocks deposited upon them. It is an unsettled point whether they are connected with glacial action; if connected with it, the whole appearances and consistency demonstrate at least subsequent marine action. There is a remarkable *eskar* on a moor spreading below Darrington Law, in Berwickshire (900 feet above the sea); another, about a mile long, has been pointed out amidst a vast alluvial accumulation at St Fort, Fifeshire.

ESQUINTLA, or ESCUINTLA, a town of the state of Guatemala, Central America, 25 miles south from Guatemala, on the river Michatoys, which falls into the Pacific Ocean. It has a fine church. Pop. 6000, consisting in great part of Indians.

ESSENCES. This term is frequently used as synonymous with volatile oils.

EVANS, MISS MARY A., understood to be the daughter of a dissenting minister in Derbyshire, was born about the year 1820. Before she became known as the author of the remarkable series of fictions with which her name is popularly associated, she had already acquired reputation in the literary circles of the metropolis as a writer of distinguished ability. She contributed largely to the *Westminster Review*, of which she is said to have been at one

time joint-editor, and is known to have been the translator of the famous *Leben Jesu* of Dr Strauss, an English version of which was published in 1846. During 1857, there appeared in *Blackwood's Magazine*, with the signature of George Eliot, a series of stories under the title of *Scenes of Clerical Life*, the very unusual merit of which instantly attracted attention. They seemed to proclaim with great distinctness the advent of a new novelist of fresh and original power. It was from the first sufficiently well understood that the signature was a mere *nom de plume*; and no little curiosity was excited as to the personality of the author unknown. This feeling was much deepened by the publication in 1858, by the Messrs Blackwood, of the novel of *Adam Bede*, which attained an immense success, and at once secured for the writer almost undisputed rank with the most eminent novelists of the day. This was followed, in 1859, by *The Mill on the Floss*, which amply sustained the reputation of the writer; and in 1861 by *Silas Marner, the Weaver of Raveloe*, a tale in one volume, which, as to art, is perhaps the most perfect of any of this series of works. In 1861, the *Scenes of Clerical Life* were republished from *Blackwood's Magazine*, to meet with a renewal of the favour with which they were originally received; and in 1863, *Romola*, an elaborate historical novel of Italian life, was published by Messrs Smith, Elder, & Co., in whose *Cornhill Magazine* it had previously from month to month appeared. This work has never had quite the popularity of its predecessors, but is considered by a selecter circle of readers—and perhaps on the whole with justice—the greatest intellectual effort of the author. Meantime—though the avowal has never in any formal fashion been made—it had by degrees become positively certain that Miss E. was the 'George Eliot' of these works; and by not a few competent critics a place had been frankly assigned her at the very summit of this branch of our literature. Her last book, *Felix Holt, the Radical*, published last year (1866) by the Messrs Blackwood, was distinctly the book of the season, and was almost everywhere received with acclamation. Cool critics here and there, however, will probably be of opinion, that whilst it indicates no decline in power, and contains passages in various kinds as exquisite as any produced by the writer, it is distinctly, perhaps on the whole, her least complete and satisfactory performance. In virtue of the finish and mellow harmony of her writing, with its reflex of general culture and accomplishment, her genuine philosophic power of thought, her deep and serious view of life, admirable humour, and mastery of the springs of pathos, there cannot certainly be more than one or two novelists now living who are to be ranked on a level with George Eliot.

EXHIBITIONS, INDUSTRIAL. Since the article on this subject appeared in the *Encyclopædia*, three international exhibitions have been held—one in 1862 in London; the next in 1865 in Dublin; and the third, that of Paris, during the present year (1867). That of 1862 was held in a vast brick building, lighted by a roof and two immense cupolas of glass, designed by Captain Fowke, R.E., and erected on a large space of land acquired by the Royal Commissioners of the Great Exhibition of 1851, adjoining the beautiful garden of the Horticultural Society at South Kensington. The space covered was 1,291,800 square feet, or about 17 acres, including some portions of the buildings of the garden, lent by the Horticultural Society, for refreshment-rooms, &c. Of this vast space, 391,146 square feet were occupied by objects exhibited, besides 284,670 square feet of wall and other vertical space made by internal partition, &c.; to which must be added 93,220 of

horizontal and vertical space occupied by works of art, arranged in one of the most admirably constructed galleries ever designed for such a purpose. It was evidently the idea of the projectors of this building that it might be retained and devoted to other purposes after the exhibition, in the same way as the Palais de l'Industrie, in which the Paris Exhibition of 1855 was held, is still retained, and is both a useful and ornamental acquisition to the French capital. But neither this project nor the building itself found favour with the public, and it was destroyed in 1863, a year after the close of the exhibition. It will give a good idea of the vastness of these great international exhibitions if we give a few figures shewing the number of exhibitors, visitors, and other statistics of that of 1862. Thus, there were 26,345 exhibitors in the Industrial Division, whose exhibits were arranged in 36 classes; and 2305 artists, in four classes, in the Fine Art Division: or in all, 28,653. Of these, 8487 were British manufacturers, and 990 British artists; and 17,861 foreign manufacturers, and 1315 foreign artists. The extent of the Fine Art collection surpassed all expectations: it comprised 3370 paintings in oil and water colours, 901 pieces of sculpture, 1275 engravings and etchings, and 983 architectural designs. The number of visitors averaged 36,328 per day. The aggregate number was 6,211,103 from the date of opening, May 1, to its close, October 31. The money taken for admission amounted to £328,858. There were 620 persons appointed to examine the articles exhibited, and adjudicate the rewards, which consisted of medals and certificates of Honourable Mention. The entire cost of this gigantic affair was £321,000. This was secured against all risk of failure by a voluntary guarantee entered into by 1152 gentlemen of all ranks, who pledged themselves in various sums, amounting, in the aggregate, to £450,000. The following are the classes into which the enormous aggregate of the world's productions was divided:

1. Mining, Quarrying, Metallurgy, and Mineral Products.
2. Chemical Substances and Products, and Pharmaceutical Processes.
3. Substances used for Food.
4. Animal and Vegetable Substances used in Manufactures.
5. Railway Plant, including Locomotive Engines and Carriages.
6. Carriages not connected with Rail or Tram Roads.
7. Manufacturing Machines and Tools.
8. Machinery in General.
9. Agricultural and Horticultural Machines and Implements.
10. Civil Engineering, Architectural, and Building Contrivances.
11. Military Engineering, Armour and Accoutrements, Ordnance and Small-arms.
12. Naval Architecture—Ships' Tackle.
13. Philosophical Instruments, and Processes depending upon their Use.
14. Photographic Apparatus and Photography.
15. Horological Instruments.
16. Musical Instruments.
17. Surgical Instruments and Appliances.
18. Cotton.
19. Flax and Hemp.
20. Silk and Velvet.
21. Woollen and Worsted, including Mixed Fabrics.
22. Carpets.
23. Woven, Spun, Felted, and Laid Fabrics, as Specimens of Printing or Dyeing.
24. Tapestry, Lace, and Embroidery.
25. Skins, Fur, Feathers, and Hair.
26. Leather, including Saddlery and Harness.
27. Articles of Clothing.
28. Paper, Stationery, Printing, and Bookbinding.
29. Educational Works and Appliances.
30. Furniture, Paper-hanging, and Decoration.
31. Iron and General Hardware.
32. Steel Cutlery and Edge Tools.
33. Works in Precious Metals and their Imitations, and Jewellery.
34. Glass, for Decorative and Household Purposes.
35. Pottery.
36. Toilet, Travelling, and Miscellaneous Articles.
37. Architecture.
38. Paintings and Drawings.
39. Sculpture, &c.
40. Etchings and Engravings.

Notwithstanding much opposition and ill-feeling, the International Exhibition of 1862 proved a great success. Like its predecessor in 1851, it gave a vast impetus to trade generally, and it enabled the public to form correct opinions upon the progress of our manufactures, and their shortcomings when compared with others. Each of the following foreign countries responded to the invitation of the Royal Commissioners, and was amply represented; and from nearly all, a staff of commissioners and officers were sent to conduct their business, and watch over the interests of their exhibitors in London: Central Africa, Western Africa, Belgium, Brasil, China, Costa Rica, Denmark, Ecuador, France and its Colonies, Germany—Austria, Zollverein (Duchy of Anhalt-Bernburg, Duchy of Anhalt-Desau-Cöthen, Grand Duchy of Baden, Bavaria, Brunswick, Frankfurt-on-Maine, Hanover, Hesse-Cassel, Grand Duchy of Hesse, Principality of Lippe, Grand Duchy of Luxemburg, Nassau, Grand Duchy of Oldenburg, Kingdom of Prussia, Kingdom of Saxony and Principality of Reuss [J. L.], Grand Duchy of Saxony, Duchy of Saxe-Altenburg, Duchy of Saxe-Coburg-Gotha, Duchy of Saxe-Meiningen, Principality of Schwarzburg-Rudolstadt, Principality of Schwarzburg-Sonderhausen, Principality of Waldeck, Württemberg), Mecklenburg, Hanse Towns (Bremen, Hamburg, Lübeck)—Greece, Hawaiian or Sandwich Islands, Hayti, Ionian Islands, Italy, Japan, Liberia, Madagascar, Netherlands, Norway, Peru, Portugal, Rome, Russia, Siam, Spain, Sweden, Switzerland, Turkey, United States, Uruguay, Venezuela.

The next exhibition of importance was that held in Dublin in 1865, which was originated by a company, whose object was to establish the principle of decennial exhibitions, and, if possible, make this one pay the expense of erecting the magnificent building in which it was held, and thereby form a permanent home for such exhibitions and other useful purposes in future. This building was of brick, covered with stucco, and the roof of glass and iron, light but commodious galleries running entirely round the interior. The whole surface occupied by the structure was 5700 square yards. It was, in every respect, well adapted for the purposes for which it was raised, and had an extensive pleasure-garden nearly surrounding it. The exhibition was successful in everything but its pecuniary results. It was amply patronised both by foreign exhibitors and visitors, and like that of 1862 in London, and the previous ones of Dublin and Paris, it combined fine arts with the manufactures, mining, and other industries.—The present year has witnessed, in Paris, the greatest of all international exhibitions, both with respect to its extent and to the scope of its plan. Its site is on the Champ-de-Mars, the great military parade-ground of Paris, and it occupies the enormous space of 37 acres. It consists of a large building of an elliptical form, arranged in twelve concentric circles, with a small open central garden. The outer circle is much more lofty and broader than any of the others, is roofed with corrugated iron, and lighted with clerestory windows, and is devoted to Machinery of all kinds, and to the processes of manufacture in various branches of industry. Outside this circle are placed practical illustrations of the food department, in the form of restaurants of all nations—the exhibition of specimens of food-substances being in small courts within the outer wall, or back to back with the restaurants. The first circle within that for Machinery is for Metallurgy, Chemistry, Dyeing, &c.; then follow Textile Materials, Clothing, Household Furniture, Personal Ornaments, Plate, Porcelain, &c.; then matters relating to General and Special Education. Then comes the Gallery of Fine Arts, in which the

paintings, sculpture, and other fine-art works of all nations are exhibited; and within this circle, again, is another, in which an archæological collection from each country is displayed for the purpose of shewing the rise and progress of industrial art in every country. This is a novel and most valuable addition, which has been admirably conceived and carried out. Another most important feature in the Paris Exhibition is the Park, or out-of-door portion, which occupies by far the larger part of the whole space. In this are shewn actual examples of the styles of domestic and palatial architecture of most countries, and even the tents of some of the nomad tribes, such as the Kirghis Tartars, and Samoyeds of the Russian Empire, the Bedouin Arabs, &c. The beasts of burden of different nations, such as horses, camels, &c., are also shewn, and all kinds of civil and military erections of general importance. The Exhibition has had great and deserved success; it has been visited by most of the principal monarchs of the world, and vast multitudes of people of all nations. For some reason, however, no reliable statistics have been published, and it is feared that, peculiarly, it will not succeed. It seems to be the culmination of industrial exhibitions, and it will teach the lesson, that it is possible to go too far in this direction, for in many respects it has been quite unmanageable, and shews the necessity of narrowing the limits of future exhibitions, if we desire to obtain the best results.

EYRE, EDWARD JOHN, a distinguished explorer and English colonial governor, is the son of the late Rev. A. Eyre, Vicar of Hornsea, and Rector of Long Reston in the East Riding of Yorkshire, and was born in 1817. He was educated at the grammar-schools of Louth and Sedburgh. He was originally intended for the army; but at the age of 17, he resolved to emigrate, and seek his fortune in Australia. After serving a short apprenticeship with a settler on the Hunter River in New South Wales, he became a squatter on his own account in the same colony, and invested in the business a capital of £400. The idea struck him, that cattle might be profitably driven overland by the Murray River from New South Wales to South Australia—thus saving the difficult and circuitous voyage from Sydney to Melbourne. He made the attempt; and it proved so successful that, with the profits, he was able to purchase an estate on the Lower Murray, where he took up his abode. He was originally resident magistrate and protector of aborigines. The natives had been cruelly ill used by the colonists who had penetrated farthest inland, and had even been shot and poisoned with impunity. Mr E. sought to remedy these evils, and discharged the difficult task of settling the disputes between the settlers and natives in a manner admitted by all to have been most judicious, just, and humane. A movement was made, in 1839, to explore the unknown region between South and Western Australia, lying north of the Great Australian Bight. Two routes were suggested—one north of Lake Torrens, the other along the sea-coast. E. warmly advocated the former, and offered, if it were adopted, to head the expedition, and pay one-third of the expense; and the subscribers to the fund at Adelaide accepted his offer. In 1840, he set out with a company of four Englishmen and two native boys; but the expedition proved unsuccessful; and after wandering for months along the muddy or sandy shores of Lake Torrens, the party were compelled to return to Port Lincoln, whence they were conveyed to Adelaide by a vessel sent for their relief by the governor. Then E. determined to attempt the southern route. In February

1841, although strongly urged to abandon the undertaking, he set out, accompanied by a man named Baxter and three aboriginal boys. Baxter was killed, two of the boys deserted, and E. was left to complete the journey with one boy, named Wyllie, a native of Western Australia. For a week at a time, E. was without water, and he would have finally fallen a victim, like other Australian explorers, to fatigue and thirst, had he not obtained a fortnight's rest in a whaler anchored off the coast. He reached King George's Sound on the 7th July, having thus accomplished a journey of 1000 miles in four months in one of the most sterile regions known to exist. His journey proved that no route of any value can be opened up along the southern coast of Australia, and that no fertile spots break the waste—a fact of immediate importance so long as Western Australia remains a penal settlement. E. published a Journal of his Expedition, in which he included an account of the natives and their relations with Europeans. In 1845, he returned to England; and in the following year, he received the appointment of Lieutenant-governor of New Zealand, under the governor, Sir George Grey. It was his special duty to administer the government of the middle island. At the expiry of the customary six years' service of a colonial governor, E. returned to England, and received the appointment of Lieutenant-governor of St Vincent. In 1862, he was appointed governor of Jamaica, for which his success in dealing with the inferior races in Australia seemed pre-eminently to fit him. When, in October 1865, the negro disturbances broke out in Jamaica, E., acting in conformity with the almost universal feeling of the white population, and guided by his knowledge of the negro character, resolved to check the progress of disaffection among an ignorant and half-savage population by prompt and energetic measures. A general panic prevailed. Martial law was proclaimed under a local statute. A Mr Gordon, believed to have taken a leading part in the rebellion, was hurriedly tried on a Saturday, by court-martial, and hanged on the following Monday, after the sentence had been confirmed by Eyre. The insurrection was successfully repressed. Complaints, however, were made that Gordon had been condemned irregularly and on insufficient evidence; and that other excesses of severity had been committed. A commission sent out to inquire into the facts came to the conclusion that such was so far the case, and E. was recalled. He returned to England, and took up his abode at Adderley Hall, near Market-Drayton, Salop. English opinion was much divided as to the course he had taken. Those who disapproved of his conduct, represented by Mr John Stuart Mill, M.P., and Mr P. Taylor, M.P., resolved to prosecute him on a charge of murder. An Eyre Defence Fund was raised, and a committee appointed for his defence, in which the most prominent place was taken by Mr Thomas Carlyle and Sir Roderick Murchison. E. was summoned before a London police court, but declined to attend, on the ground of non-residence. On the 25th of March 1867, he appeared before the petty sessions at Market-Drayton, where the charge of murder made against him was dismissed by the magistrates. No one doubts that E. is a brave, kind-hearted, and honourable English gentleman; but it must be admitted that he committed a grave error of judgment in endorsing the sentence against Mr Gordon, without seeing that the evidence was sufficient, led away, as he no doubt was, by the panic around him.—See *Journal of Expedition of Discovery by Eyre, and Life of Eyre*, by Hamilton (Hume, 1867).

F

FACTORY ACTS. Important extensions and various modifications of the factory acts have recently been made. The acts 23 and 24 Vict. c. 73, 26 and 27 Vict. c. 38, and 27 and 28 Vict. c. 98, have extended the provisions of the factory acts to bleaching and dyeing works, calendering works, and works in which the processes of finishing, hooking, or lapping, or of making and packing yarn or cloth of cotton, wool, silk, or flax, are carried on. The provisions of the acts were applied to persons employed in lace factories by the act 24 and 25 Vict. c. 117. The Factory Acts' Extension Act, 1864 (27 and 28 Vict. c. 48), refers specially to certain trades regarded as more than usually unwholesome—namely, the manufacture of earthenware (except common bricks and tiles), of lucifer-matches, of percussion-caps, and cartridges, paper-staining, and fustian-cutting. It provides that every factory to which it applies shall be kept in a cleanly state, and be ventilated in such a manner as to render harmless, so far as is practicable, the gases, dust, or other impurities generated in the process of manufacture that may be injurious to health; and it gives the manufacturers power to make special rules, with the sanction of the Home Secretary, for the guidance of the work-people, so as to prevent the requirements as to cleanliness and ventilation from being infringed, and to punish any breach of these rules by a penalty not exceeding £1. The Factory Acts' Extension Act, 1867 (30 and 31 Vict. c. 103), is the most important act which has been passed on the subject since the passing of the leading act in 1844. It extends the scope of the acts very considerably, making them apply to (1) blast-furnaces, or premises in which the process of smelting is carried on; (2) copper mills; (3) mills for converting iron or steel; (4) foundries for iron, copper, brass, or other metal; (5) premises in which mechanical power is used in the manufacture of machinery, of any article of metal, or in the manufacture of india-rubber or gutta-percha; (6) premises in which the manufacture of paper, of glass, or of tobacco, letter-press printing, or bookbinding is carried on; and lastly (7) any premises constituting one trade establishment in which fifty or more persons are employed in any manufacturing process. The act makes a number of temporary modifications of the preceding acts, so as to prevent hardship by the sudden introduction of their provisions into the new trades. It also contains a number of permanent modifications of their provisions, of which the principal only can be pointed out. It gives power to the Home Secretary, in all trades whose customs or exigences require it, to authorise the occasional employment of males of 16 beyond the hours allowed by the factory acts; to authorise children, young persons, and women to be employed at different hours; to modify the regulations as to fencing machinery; and to modify the arrangements as to holidays, and as to working on Saturday afternoons. These powers the Home Secretary can exercise only within certain narrow limits. Power is also given to him to sanction certain deviations in regard to the hours of labour in some specified trades, such as letter-press printing and bookbinding. The act also contains some regulations to be kept in view in

applying the former factory acts to the glass, paper, and others of the new trades. Amongst its general provisions is an important one to prevent such over-crowding in factories as might be prejudicial to health. It must be confessed, however, that although its provisions are very beneficial, the act of 1867 has not left the law in a satisfactory condition in so far as its arrangement is concerned; but it is understood that it is in contemplation to consolidate at some early period all the acts relating to the employment of persons in factories. See **WORKSHOP REGULATION ACT.**

FAIR ISLE, an island about 3 miles long by 2 broad, lying between Orkney and Shetland, or 25 miles from either; ecclesiastically, it belongs to the parish of Dunrosness, in Shetland. It was on this rocky isle that one of the vessels of the Spanish Armada, having on board the Duke of Medina Sidonia, was wrecked in the attempt to escape northwards, 1588. The vessel having gone in pieces, the crew were thrown on the hospitality of the poor islanders. The Duke, after a time, got to Quendale House, on the mainland of Shetland, and eventually landed in safety at Dunkirk. From the Spaniards on this occasion, the natives of Fair Isle acquired a knowledge of the art of forming woollen articles, such as caps, mittens, and scarfs, in divers colours, the preparation of which is still a staple employment in the island for purposes of export.

FA'RNWORTH, a town of Lancashire, two miles and a half south-east from Bolton-le-Moors, near the Tonge, a branch of the Irwell. It is a station on the Manchester and Bolton Railway. It has a picturesque embattled chapel, of the 15th century. The manufacture of sail-canvas, and the making of watches, files, &c., are carried on. Pop. (1861) 8720.

FARRAGUT, DAVID GLASCOE, Vice-admiral of the American navy, was born near Knoxville, Tennessee, in 1801; and at the age of eleven years entered the navy as midshipman, under Captain David Porter, in the *Essex* frigate. At the age of 21, he was made lieutenant, and appointed to the Norfolk Navy-yard; in 1833, he commanded the *Natchez*, on the Brazil station, and in 1838, in the West Indies; in 1847, he was appointed to the sloop-of-war *Saratoga*; in 1851, made Assistant-inspector of Ordnance; in 1854, sent to construct a navy-yard in California; and in 1855, with the rank of captain, appointed to the steam-frigate *Brooklyn*, in the home squadron. In January 1862, he was appointed to the command of a naval expedition to act against the Confederates in the Gulf of Mexico; and on April 24, after a heavy cannonade, his squadron passed the forts at the mouth of the Mississippi, and on the 28th, he received the surrender of New Orleans. Ascending the Mississippi, he took Natchez; and aided by a fleet of gun-boats, which had descended the river, made an attack on Vicksburg, which failed; and he withdrew to Pensacola, and operated against the coast of Texas. Raised to the rank of vice-admiral in March 1863, he once more passed up the Mississippi, successfully ran past the heavy Confederate batteries of Fort Hudson, and aided General Grant in the combined attack on Vicksburg, which resulted in its capitulation, July 4. In August 1864, after a furious

engagement between his fleet and the Confederate forts and vessels at Mobile, in which the *Tecumseh* monitor was sunk by a torpedo, with the loss of all on board, he succeeded in capturing the forts, which led to the fall of the city. Admiral F. has been one of the most active and successful commanders in the American navy, and out of 50 years was only 11 years unemployed at sea.

FECHTER, CHARLES ALBERT, an actor of some eminence, and manager of one of the London theatres, was born in London about the year 1823, his father being a Frenchman, and his mother an Englishwoman. When only three or four years old, he went with his parents to France, and was there educated as a sculptor. His predilections were, however, in favour of the stage; and, believing himself capable of interesting the public as an actor, he appeared for the first time at the Salle Molière, in a piece called *Le Mari de la Veuve*. Afterwards, he acted for some weeks at the Conservatoire, and then went with a travelling company, which performed in the principal cities. In 1846, F. performed in Berlin with considerable success; in the following year, at the Vaudeville in Paris, and the St James's Theatre, London. After this, he played by turns at the Ambigu, the Variétés, the Théâtre Historique, and the Porte St Martin. In 1853, he re-appeared at the Vaudeville, where he created the part of Duval in the *Dame aux Camélias*. His acting also brought success to the *Fils de la Nuit* at the Porte St Martin, and to *La Belle Gabrielle*, in the performance of which he met with an accident that almost cost him his life. F. was also the original performer in those two melodramas, *Les Frères Corcos* and *Pauline*, since so celebrated on the English as well as the French stage. While making these preliminary essays, as if to qualify himself for a still higher class of impersonations, F. used to appear, as the season of the French plays in London came round year after year, at the St James's Theatre. At length he was announced to appear in an English version of *Ruy Blas* at the Princess's, on the 27th of October 1860. This being his first appearance on the English stage, there was considerable interest taken in the performance. F., however, passed through the ordeal triumphantly. He threw himself heart and soul into the character, and so perfectly identified himself with it, that people almost forgot his French accent, in admiring the energy and finish of his acting. On the 20th of March in the following year, he appeared in the character of Hamlet, the highest flight that can be attempted by any actor. There were prophecies of failure and prophecies of success, but neither of them came perfectly true. F., in the performance of this great character, while abandoning the traditions of the English stage, shewed himself capable of appreciating the difficulties he had to contend with, and in some measure surmounting them. He was the scholar and the gentleman throughout; and it was certainly a curiosity for the English public to listen to an actor who, as it was said at the time, 'went straight from the book to the boards,' and gave a thoroughly independent conception of the character of the Danish prince. Of course, there was much in it that was to be condemned: there was both exaggeration and distortion; while many passages in the play which ought to have told with great effect, seemed to make little impression on him, and consequently little or none on the audience. Still, the impersonation was, upon the whole, one that marked F. as an actor of very high powers. The same may be said of his impersonation of Othello, in which he appeared in the following October. Subsequently, F. became the lessee of the Lyceum Theatre, where he produced

The Duke's Motto and *Bel Demonio*, both of them pieces which, although they had a long run, depend more for their success upon the accessories of dress, scenery, and startling situations, than upon intrinsic merits as dramatic compositions.

FELANITCHE, or FELANITZ (anc. *Canatic*), a town of the island of Majorca, 27 miles east-south-east from Palma. It is situated in a valley, surrounded by mountains, and is well built, with a number of squares and wide streets. It has a convent and a hospital. On a neighbouring hill, is an ancient Moorish castle, with subterranean vaults. Linen and woollen fabrics are manufactured; ropemaking and brandy-distilling are also carried on. There is some trade in the products of the neighbouring country—rice, coffee, sugar, wine, brandy, fruit, and cattle. Pop. 8102.

FENIAN SOCIETY, a political association, chiefly of Irish or Irish Americans, secret in the beginning, but eventually acting by open warfare, the object of which is the overthrow of the English authority in Ireland, and the establishment of a republic, in which the rights of the native race should, as far as practicable, be recognised and represented. The etymology of the name has been the subject of some discussion; its origin being by some confounded with that of a secret society, with very similar objects, which existed in Ireland some years back, under the name of the Phœnician Society. It is certain, nevertheless, that the name is taken from that of the ancient Irish military organisation called Fionna Éirinn, which took its appellation, though not its origin, from the celebrated hero of Irish legend, as well as history, Finn (or Fionn) MacCumhail. The accounts of this renowned body, with which the bardic literature of Ireland abounds, are most curious. It was designed as a national militia, and its origin is ascribed, by Keating, to Sedna II., who was monarch of Ireland about 400 years B.C. In time of peace, it consisted of three bodies, each formed on the model of a Roman legion, and consisting of 3000 men; but in war, it was capable of being enlarged to any required limit. In winter, it was maintained in quarters at the public cost. In summer, the men were to maintain themselves by hunting and fishing. Candidates for enrolment were required to be of an honourable family, to be irreproachable in morals, and to bind themselves to observe the laws of justice and morality; they were required to be of a certain height, and strong, supple, and vigorous of body; each being submitted, before enrolment, to an ordeal, in which his powers of speed, strength, endurance, and courage were tested by trial with his future comrades. The bardic accounts of some of those conditions are extravagant and amusing in the highest degree, but the generally historical character of the institution is unquestionable; and it subsisted until the reign of Carbery, son of Cormac MacArt, by whom the body of Fionna Éirinn was disbanded, and the members having, in consequence, transferred their allegiance to Moororb, king of Munster, suffered an almost total extermination in the battle of Gavra, 284 A.D., which formed the theme of many a bardic poem from the days of Oisín (known in Gaelic legend as Ossian), son of Finn MacCumhail, downwards.

Adopting the name of this ancient military association, the modern Fenians (or Finians) are a secret association for the purpose of overthrowing by force of arms the alien ascendancy of the Saxon, and of restoring to the ancient Celtic population their legitimate status and influence in their native country. In its present form, it is of recent origin, being in the main the work of certain among the political exiles of 1848. It had its first seat in America, where the

FENIAN SOCIETY.

Irish population has largely increased since the Irish famine of 1846—1847. Many of the emigrants of that period being driven from their homes, whether by process of arbitrary ejection, with a view to the consolidation of farms, or from inability to pay any longer the rent which, until the failure of the potato, they had contrived to maintain, carried with them a sense of fancied wrong, which prepared them for almost any enterprise which seemed to promise revenge. Others had already been sympathisers, if not participators in the insurrectionary projects of 1848; and almost all were deeply imbued with that spirit of general political and social discontent, which, from a variety of causes, has long been the normal characteristic of the peasantry and working population of Ireland. By all these, the prospect of a secret organisation for the establishment of Irish independence was eagerly accepted. The most openly active seat of the organisation was in the western states, especially Chicago; but the movement was directed from New York, and possessed ramifications in almost every city of the Union containing any considerable Irish population. The association was conducted by a senate, and consisted of 'circles,' each directed by a centre, and comprising smaller circles with subordinate centres. The duty of the centres was to enrol members, who bound themselves, generally by oath, 'to be faithful to the Irish Republic as at present virtually established;' to instruct and practise them in military exercises; to raise funds for the purposes of the association, especially for the purchase of arms and munitions of war; and to extend the organisation by every means at their disposal. Agents were sent into Ireland, and to the chief seats of the Irish population in England; and while the work of secret enrolment was industriously carried on in Ireland, measures were openly concerted in America, as well for the raising of funds by private contributions, as for the purchase of arms and military stores. Opportunely, too, for the purposes of the enterprise, the termination of the civil war in America set free a large number of military adventurers who had served as privates or as officers in one or other of the American armies, and whose experience of service was turned secretly but most actively to account in the training of the young recruits enrolled in the Fenian conspiracy in Ireland. Newspapers, moreover, both in America and in Ireland were established or subsidised for the purposes of the conspiracy; and journals, broadsides, ballads, and other inflammatory publications were largely circulated among the peasantry and artisans. Taverns, alehouses, and other places of entertainment were the ordinary places of meeting; and in such places of entertainment was commonly laid the scene of one of the most formidable of the plans of the conspiracy—an organised attempt to seduce the Irish soldiers from their allegiance, and to prepare the way for their deserting to the ranks of Fenianism, when it should have reached the expected degree of maturity. It became apparent, moreover, that in this, unlike almost all similar movements, pains were taken by the organisers to exclude the Catholic clergy, by whom the Fenian confederation had from the first been steadily resisted, from all knowledge of its character and objects, as well as of the names or number of its members in the several localities; and many of the most active of the leaders were distinguished by the freedom of their religious opinions, and by their unconcealed disregard of clerical authority.

For a time, these designs were carefully concealed, and even when a certain publicity was given to them, the scheme appeared so wild and impracticable that it was regarded with incredulity, or was

looked on but as an impudent attempt, on the part of a body of unprincipled adventurers, to practise upon the patriotic susceptibilities of the ignorant and excitable Irish, especially in America. By degrees, however, partly from the impunity arising from this contemptuous incredulity, the movement acquired more solidity, and the government ascertained by reliable information that Fenianism, however corrupt in some of its sources, and however wild and extravagant in its aims, was nevertheless a reality with which it had become necessary to grapple. Measures were taken with great promptness and determination. The Habeas Corpus Act having been summarily suspended, all the known leaders in Dublin and in the provincial districts of Ireland (most of them Irish Americans) were at once placed under arrest. The chief journal of the conspiracy was suppressed and seized; additional troops were moved into Ireland, and other measures of repression were vigorously carried out. By these energetic measures, public tranquillity was maintained in Ireland; and although prosecutions were instituted, and a few individual conspirators convicted, so universally was the movement condemned by the public opinion of the country, that most of the prisoners were discharged, on condition of their leaving Ireland. But although thus in appearance extinguished, the embers of discontent continued to smoulder among the poorer peasantry and the working population of the towns; and a certain prestige was given to the fallen cause by the escape from prison, under circumstances of much mystery and a high degree of romance, of the most active and crafty of the leaders of the conspiracy. His return and that of other exiles to America renewed the agitation in that country. In the early summer of 1866, a raid was attempted into Canada, and although it proved so utter a failure as to cover its projectors with ridicule, an organisation was secretly pursued both in America and in Ireland, which resulted, in the spring of the present year (1867), in an insane and utterly abortive attempt at insurrection at home. The plan of the conspirators was to seize the castle and military stores at Chester, and having cut off telegraphic communication, to convey these arms to Dublin, in which city, as well as throughout the country generally, a simultaneous rising was to take place in concert with the enterprise at Chester. The attempt was defeated through the treachery of one of the conspirators, by whom the plot was revealed. A partial insurrection, however, took place concurrently with the intended attack on Chester, in the county of Kerry; and a few weeks later, a more extensive movement was attempted in the counties of Dublin, Louth, Tipperary, Limerick, and Cork. But the persons engaged in it were for the most part either American and Irish-American adventurers, or artisans, day-labourers, and mechanics, generally unprovided with arms, and in many cases scarcely beyond the years of boyhood. The only military enterprises undertaken by them consisted in a series of attacks on the barracks of the rural constabulary, in almost every instance unsuccessful; most of the parties dispersed, or were made prisoners after a single night's campaign. The rest betook themselves to the mountains, and after a few days of exposure and hardship, in which they managed to evade pursuit, and carefully avoided all encounter with the military, they were either captured or dispersed. The leaders have been tried at a special commission held within the spring of this year (1867), and for the present, tranquillity has been restored in Ireland. Much discontent, however, still exists; and as the foreign organisation is uncontrolled and still actively maintained, it is impossible not to look to this as a serious element of danger, and a persisting incentive

to domestic disaffection. The latest of the Fenian enterprises in England we are able to record has been the attack on a police van at Manchester, with the liberation of two suspected Fenians, and the murder of an officer of police, September 1867.

FERNANDO DE NORONHA, a lonely island of the Southern Atlantic, in lat. 3° 50' S., and long. 32° 25' W., about 125 miles from the coast of Brazil, to which empire it belongs. It is about eight miles in length. The surface is rugged, and rises into a peak about 1000 feet high, the upper part of which is very steep, and on one side somewhat overhanging. The island is mostly covered with wood; but as little rain falls, and sometimes two years elapse without any, there is little of tropical luxuriance. It is used as a place of banishment for Brazilian criminals. No woman is allowed to land on the island.

FEROZABAD, a town of India, in the British district of Agra, North-west Provinces, 24 miles east from Agra. It is the principal place of a *pargannah* of the same name. It was formerly named Chandwar, and was a place of much greater importance than at present. Its fine edifices are mostly deserted and in ruins; most of the inhabited houses being cottages thatched with straw. It is surrounded by a wall, outside of which are many mounds and shapeless ruins. Pop. 12,674.

FESCH, JOSEPH, Cardinal and Archbishop of Lyon, was born 3d January 1763 at Ajaccio. His father, a Swiss officer in the service of Genoa, had married a widow, whose daughter by a former husband, Letizia or Letitia Ramolino, became the mother of Napoleon Bonaparte. F. was thus the half-brother of Letizia, and the uncle of the future Emperor. He had entered the clerical profession, but left it at the outbreak of the French Revolution, and, in 1795, became commissary to the Army of the Alps under his nephew in Italy. The First Consul having resolved on the restoration of the Catholic worship, F. resumed the clerical habit, and was active in bringing about the concordat with Pope Pius VII. in 1801. He was now (1802) raised to be Archbishop of Lyon, and in the following year to be cardinal. In 1804, he was sent as French ambassador to Rome, where he ingratiated himself with the pope by his adroit management and ultramontane sentiments, and contributed to induce the pope to undertake his mission to Paris to consecrate Napoleon as Emperor. F. accompanied the pope, and assisted at the coronation; and for his services at Rome, he was rewarded by the office of Grand Almoner and a seat in the senate. In 1806, the Archbishop of Regensburg, Arch-chancellor and first Prince Elector of the just-expiring German Empire, and about to become the Prince Primate of the nascent Confederation of the Rhine, chose F. to be his coadjutor and successor; and, along with all these dignities, he received a stipend of 150,000 florins a year. In 1809, Napoleon wished to invest him with the Archbishopric of Paris, but F. declined it, as he had long been dissatisfied with the Emperor's policy in regard to the papal chair. In 1810, he presided at a national conference of clergy assembled at Paris, and the views which he maintained there, with even more than usual keenness, brought him into complete disgrace with the Emperor; who was still further exasperated against him by a letter which F. wrote to the pope, then (1812) in captivity at Fontainebleau, and which was intercepted. He lost his imperial dignities and pension, and the prospects of the Primacy of the Rhine Confederation were also taken away by the appointment of Prince Eugene to be Grand Duke of Frankfurt. After this, F. lived in a sort of banish-

ment at his bishopric of Lyon. At the approach of the Austrians in 1814, he fled to Rome with his sister Letizia, the mother of the Emperor, where he was received with open arms by the pope. The return of Napoleon brought him back to France, and during the Hundred Days, he was nominated a member of the Chamber of Peers, though he never took his seat; but, after the battle of Waterloo, he had again to take refuge in Italy. The royalist clergy now persecuted him with accusations and lampoons which he in no way deserved. His resistance to the will of his nephew, and indeed his whole conduct, seem to have been actuated by sincere zeal for what he considered to be the interests of the church. When called upon by the Bourbons to resign his episcopal office, he obstinately refused; and it was not till 1825, after receiving a papal brief interdicting the exercise of his clerical functions, that he resigned the charge, but not the title. In 1837, an attempt was made to reinstate him, to which, however, the French government refused assent. He lived in the greatest friendship with his sister, Madame Mère, as she was styled, till his death. He died 13th May 1839. Of his famous and very large collection of paintings, he bequeathed a part to the city of Lyon, and the rest was disposed of in a series of auctions at Rome after his death.

FEUILLEA, a genus of plants of the natural order *Cucurbitaceae*, named in honour of Louis Feuillée, a French botanist and traveller in Chili. The species are generally half-shrubby climbers, natives of the warm parts of America. The seeds, at least of some of them, as *F. cordifolia* and *F. trilobata*, contain a great quantity of a bitter fixed oil, which is obtained by expression, and is used for lamps. It has also a high reputation in the West Indies and Brazil as a cure for serpent-bites, and an antidote to some kinds of vegetable poisons, and is certainly, in small doses, an active and safe emetic and purgative.

FIELD, CYRUS WEST, an American merchant, one of a family distinguished for ability, was born at Stockbridge, Massachusetts, November 30, 1819. At the age of 15, he went to New York, and entered upon a commercial career, which he pursued with such energy and success that he was enabled in 1853 to partly retire from business, to spend some time in South American travel, and then to engage with great enthusiasm in the promotion of the Atlantic telegraph, for which he secured a charter from the colonial government of Newfoundland for 50 years; and being joined by Peter Cooper, Moses Taylor, and other American capitalists, he organised, in 1854, the New York, Newfoundland, and London Telegraphic Company; and in 1856, the Atlantic Telegraph Company. Devoting himself entirely to the work of uniting the Old and New World, he crossed the ocean nearly thirty times in its prosecution; and on the laying of the first cable, 1858, was received by his countrymen with enthusiastic plaudits. Undiscouraged by the speedy failure of the first cable, he continued his exertions; and on the success of the cable of 1865, received a gold medal at Liverpool, and a vote of thanks from the American Congress. See ATLANTIC TELEGRAPH.

FIGLINÉ, or **FIGHINE**, a town of Central Italy, in the province of Florence, and 15 miles south-east from Florence, on the left bank of the Arno. It is surrounded by a rectangular wall, and is traversed by a fine street, through which passes the great road from Florence up the valley of the Arno. The silk of F. is reckoned the best in Tuscany. Pop. 4533.

FIGUEIRA, a town of Portugal, in the province of Beira, at the mouth of the Mondego, 23 miles west-by-south from Coimbra. Its harbour, is a

small bay or estuary of the Mondego, and is safe, but difficult of access, particularly for large vessels. It carries on, however, a considerable trade. The chief exports are salt, wine, vinegar, oil, dried fruits, and oranges. The wine shipped from F. is known in England by the names of *Figueira* and *Bairrada Wine*. It is quite different both from port and from sherry. It is best when new, and does not bear keeping long. F. is much resorted to as a bathing-place. Pop. 3267.

FILADELFIA, a town of South Italy, in the province of Catanzaro, 18 miles west-south-west from Catanzaro, on the western side of the Apennines, and on a branch of the Angistola. Pop. 4939.

FINALÉ, a town of North Italy, in the province of Modena, on the Panaro, 22 miles north-east from Modena. It is surrounded by walls, has manufactures of linen and silk, and an active general trade. Pop. (1861) 4722.

FIORENZUOLA (*Florentiola*), a town of Northern Italy, in the province of Piacenza, 22 miles west-north-west from Parma, on the Arda, in a beautiful and fertile plain. It is a station on the railway between Parma and Piacenza, and is also on the ancient Æmilian Way. It is well built, and a place of considerable activity. It formerly had numerous conventual and other ecclesiastical establishments. The principal church is still collegiate, and contains some curious relics of ancient art. There are some interesting relics of mediæval times in Fiorenzuola. It is supposed to occupy the site of the ancient *Fidentia*. Pop. 2967.

FIRBOLGS, the name given in the fabulous early history of Ireland to a tribe said to have descended from the Nemedians, who, under their leader Nemedius, landed in the island about 2260 B. C.; and after 217 years, left it, on account of the oppression to which they were subjected by pirates called the Fomorians. The emigrating Nemedians formed three bands—one went to Thrace, and from them descended the F.; a second to the north of Europe or Lochlan, from whom descended the Tuatha de Danann; and the third to Alban or Scotland, from whom sprung the Britons. The F. returned to Ireland in three tribes, one of which more especially bore the name Firbolg; the others were called Firdomnan, and Firgailian. The three tribes, however, were under five leaders, by whom Ireland was divided into five provinces. With Slainge, the first Firbolg king, who began to reign 1934 B. C., and reigned only one year, the Irish historians begin their account of the Irish monarchy and list of kings. The F. were driven out, after they had been thirty-six years in Ireland, by their kinsmen, the Tuatha de Danann, from Scotland, they having previously passed over to that country from Lochlan; and these, in their turn, were expelled or conquered by the Milesians. The most recent investigators of the early history of Ireland regard the story of the F. as having some basis of truth, but no chronological accuracy; the different tribes having long subsisted in the country together, and with varying fortunes as to temporary superiority. See IRELAND.

FIRMINY, a town of France, in the dep. of Loire, six miles south-west from St Etienne, with which it is connected by a branch railway. Near it are rich coal-mines. It is a place of much activity, and has manufactures of silk, glass, and hardwares. Ribbons and nails are among the articles of manufacture most largely produced. Much lamp-black is also made. Pop. (1866) 7747.

FIROLA, a genus of gasteropodous molluscs, of the order *Heteropoda*, entirely destitute of shell—although there is a small branchial shell in the

nearly allied genus *Carinaria*; of a very elongated form, having the mouth situated at the extremity of a proboscis; tentacula wanting, or merely rudimentary; and generally remarkable for great transparency of substance, often enlivened with golden spots. They swim by means of the *foot*, which is compressed into a fin, are often to be seen at the

Firola Frederici.

surface of the water in calm weather, and are abundant in the warmer temperate and tropical seas. The oxygenation of the blood is supposed to take place in part through the delicate tissues, as there are no special breathing organs but a ciliated band.

FISHING. The capture of fishes for food has been carried on in a variety of ways from the most remote antiquity, and is probably at least as ancient as the hunting or trapping of any kind of wild animal. The supply of food yielded to man by the waters seems always to have borne a very considerable proportion to that yielded by the land. Of all modes of capturing fish, the most simple and primitive is that of taking them with the hand, which is still an amusement of boys, who thus catch trout in small streams by groping below the stones where they hide. This is called in the east of Scotland *gumpig*, in the west *ginneling* or *guddling*. Even sea-fish are sometimes taken by the hand, approaching the shore in such dense shoals that the water seems almost to be filled with them. This is particularly the case on the north-western coast of North America, a region which appears to abound in fish more than any other part of the world; and there, besides the occasional use of the mere hand, the Indian often catches fish by means of a hand-net or a basket, paddling his canoe into the midst of the shoal, and, as it were, baling the fish out of the water. The use both of the net, in various forms, and of the hook and line, as well as also of the fishing-rod, are very ancient. Allusion is made in several places of the Old Testament to the use both of nets and hooks in the capture of fish. Some of the most important fisheries, as the herring-fishery, are carried on almost exclusively by the net. For different fisheries, however, nets of very different kinds are used. See FISHERIES and NETS; also HERRING, SALMON, and other articles on the most important kinds of fish. The capture of some very valuable kinds of fish—as cod, haddock, and others of the same family—takes place chiefly by means of the hook and line, and either by what is called the *long-line*, to which many hooks are attached, and which is extended horizontally over a bank frequented by the fish, its place being marked by floats, and drawn after the lapse of at least several hours; or by the *hand-line*, which, being let down over the side of a boat with a *sinker* proportioned to the strength of the current, is watched by a fisherman holding it in his hand, and hauled up immediately on a fish being felt to bite. The baits are, of course, various, according to the opportunity of procuring them and the kinds of fish. The use of the fishing-rod along with the hook and line is not so general for the capture of sea-fish as of fresh-water fish. See ANGLING. A rude fishing-rod, however, is often used for the capture of some sea-fish. The Pollack (q. v.) or lythe, the mackerel, and some other fish of the British seas, are often caught by

rod-fishing from boats under sail. The young of the Coal-fish (q. v.) are caught in great numbers by the fishing-rod from rocks on the British coasts; and this, which is chiefly an amusement for boys in most parts of Britain, supplies no inconsiderable part of their food to the inhabitants of Orkney and Shetland. The shooting of fishes with arrows is practised by some of the South American Indians; some very large kinds of fish—as the Arapaima (q. v.)—are occasionally harpooned; and many large fish, both of the sea and of the fresh water, are killed by means of spears—a mode of fish-capture common enough in some parts of Scotland, and much employed by salmon-poachers, the spear—three-pronged—being known as a *leister*. Torches are also used by night in many parts of the world, both in sea and river fishing, to attract fishes by the light, which in this way has an almost certain effect. The poacher on a Scottish salmon-river conjoins the use of the torch with that of the leister, and this is popularly known as 'burning the water.' It is now wholly illegal, as is the use of the leister under any circumstances. The flying-fish is similarly attracted by torches on the coasts of the South Sea Islands, but a small net is used instead of a fish-spear. The inhabitants of the South Sea Islands take advantage of the habit of some fishes, of leaping out of the water when alarmed, to catch them by means of rafts in the shallow lagoons, encircling them so that they finally leap upon the rafts. The Indians of North-western America sometimes adopt a similar method of capturing the Viviparous Fish (q. v.) of their coasts. Other very peculiar modes of catching fish which are in use among them are described in the articles CANDLE-FISH and SALMON OF NORTH AMERICA in the SUPPLEMENT. They also take the Vancouver Island herring (see HERRING, VANCOUVER ISLAND, in SUPPLEMENT) by constructing long dams of lattice-work on flats left dry by the retiring tide, in which the fish are caught which have come in with the tide. This method of taking herring, however, has long been known on the British coasts; and *cruives*, which are lattice-work constructions of a smaller size, have been used with great success in many places. Cruives are also very effective in the capture of salmon, a suitable place of the river being chosen for them, and they being so contrived that the fish readily get in, but do not readily get out. A very peculiar mode of taking fresh-water fishes is practised in Ceylon, by means of a funnel-shaped basket, open at both ends, which is suddenly plunged down, the wider end downwards, till it sticks in the mud, when, if a fish is felt to beat against the sides, it is taken out with the hand.

The capture of fresh-water fish by means of vegetable poisons of various kinds, is practised equally in the East Indies, in Africa, and in the warm parts of America. The poisons used do not render the fish poisonous. The poisoning of trouts and other river-fish with lime is too frequent in some parts of Britain, and is one of the worst kinds of poaching, all the fry, as well as the fish fit for the table, being destroyed, and the mischief often extending far farther down the stream than the perpetrators of it proceed in pursuit of their spoil.

Cormorants are trained by the Chinese for the capture of fish. Otters have also not unfrequently been trained and employed for the same purpose. For a full account of sea-fishing, and the apparatus employed, the reader is referred to *The Sea Fisherman*, by J. C. Wilcocks.

FLAHAULT DE LA BILLARDERIE, AUGUSTE CHARLES JOSEPH, COMTE DE, a French soldier and diplomatist, was born at Paris on 20th April 1785. He was destined for the army by his

father, a general officer; and when a mere lad, he crossed the Alps with Napoleon as a volunteer in a cavalry regiment. He was rapidly promoted to the rank of aide-de-camp of Napoleon. He distinguished himself in the Peninsular War and the Russian campaign; and in 1813, received the title of Count, and the rank of general of division in the new army. On the return of Napoleon from Elba, he was one of those who recommended him to abdicate in favour of his son. He became an exile after Waterloo; and while in England, married a Scotch heiress, Lady Keith, the proprietor of Tulliallan, in Clackmannanshire, and a British peeress in her own right. His name was afterwards removed from the list of exiles. After the revolution of 1830, F. returned to France, and was restored to his rank in the army. He entered the household of the king, and was appointed ambassador to Vienna, a post he held from 1842 to 1848. After the establishment of the second Empire, F. was called to the senate; and in 1860, sent as French ambassador to London, a post for which his acquaintance with this country, and connection through his wife with the higher classes in England, well fitted him, and which he retained until 1862. In 1864, he was named Grand Chancellor of the Legion of Honour. F. has no son. His daughter married the fourth Marquis of Lansdowne.

FLOATING DOCKS. So long as ships remained of a small size, no difficulty was found in effecting repairs on their hulls by the simple method of laying them on any convenient beach or sandbank at high water. The receding tide would leave them high and dry for a few hours at a time; and by actively working at the repairs during low water, they could generally be accomplished, without any special contrivance for taking the vessel out of the water. This plan is not, however, applicable to the larger vessels now in use. The rise and fall of the tides is in many localities insufficient for the purpose of leaving the hull dry at low water, and the larger the ship the greater the risk of 'beaching.' Numerous plans have been adopted for getting at the bottoms of large vessels. Fig. 1 represents a mode of heeling

Fig. 1.

over ships which answers very well. A is a lighter of sufficient size and weight, provided with very powerful 'heaving-down tackle,' consisting of strong ropes, B, passing through very large blocks. These tackles are made fast to the masts of the vessel, which are previously secured by extra stays, on the upper side at D; and then, by working the tackles, the hull of the vessel is heeled over until it assumes the position shewn in fig. 1. Of course, this plan necessitates the removal of the whole of the cargo. When the vessel is lightened of all removable weight, the whole of one side, and even the keel, can be thrown out of the water, the other side offering sufficient buoyancy to carry the whole weight of the vessel. By hauling the vessel over first on one side, and then on the other, the whole of the hull can be got at without any difficulty. Of course, still-water is required to carry out this method with safety. Where there is no rise and fall of tide, the lighter, A, is not required, as the tackle, B, can be made fast to the quay or pier. Graving or Dry Docks (q. v.) offer a very

FLOATING-DOCKS.

easy plan for repairing ships; but they are always very costly to construct, and in many localities, sufficiently firm foundations are not attainable.

Floating-docks have been in use for many years. Until quite recently, they have been built of timber, in the form of a large box with a flap-door falling down on strong hinges at one end. They are moored in still and shallow water, with a depth just sufficient to allow the vessel to float into them as they rest on the bottom. The flap-door is then raised up, and the water pumped out. Those timber docks are incapable of being used in deep water, in consequence of their want of stability. If the vessel being docked happened to be so light that the dock began to float before the water was all pumped out of the dock, it was very apt to heel over, and thus cause the water to rush to one side, endangering both ship and dock. A considerable number of wooden floating-docks, of a size sufficient to dock large vessels, have been built in the United States of America. Some of these American docks have been built in sections; that is, a number of short docks are joined together to make a structure long enough to take in a long ship; but those wooden erections have little strength or durability.

It was not until the introduction of iron as the material for constructing them, that floating-docks were made capable of working in deep water, and able to take in the largest class of ships.

Mr R. W. Thomson, C.E., of Edinburgh, designed in 1859 a great iron floating-dock for the port of Sourabaya, Java. The task of making this dock was offered to several of the principal iron ship-builders, but the high price demanded for its construction led Mr Thomson to devise a new mode of executing such works. Hitherto, the plan followed was to build up the structure in this country, fastening all the parts together by means of screw-bolts, putting on each individual piece in its place a mark indicative of its special position, pulling the whole down again, and re-erecting it abroad. In fact, the entire work had to be done twice over. Mr Thomson determined to make every separate piece of the Sourabaya Dock from drawings, and to dispense altogether with the costly operation of building up in this country. Some idea may be formed of the skill and care required for the proper fulfilment of this undertaking, when it is stated that there were upwards of 75,000 separate plates, ribs, and angle-irons, every one of them shaped, punched with numerous holes, and ready in every respect to be riveted into their places without any further preparation. It was absolutely necessary that every one of the two millions of holes that were to be punched in all these plates and pieces of iron should be accurately in its right place. The making of special drawings for so many separate pieces was, of course, out of the question; but Mr Thomson succeeded in carrying out his system so completely, that there were only about 450 separate forms to be made. Not only was the variety of the forms of pieces reduced, but the uniformity of the pieces of any particular form was so provided for that each would fit into any one of the places where its class appeared. Thus, a plate belonging to the bottom of the dock would fit equally well into any part of the bottom; it could even be turned upside down, or end for end, and still all the numerous holes punched in the plate would fall precisely opposite the equally numerous holes already made in the ribs, &c., to which the plate was to be attached. It was the same with all the other classes of pieces—they, and all the holes in them, would fit precisely in any of the localities for which they were destined. By systematising the work in this manner, it

became possible to spend sufficient time and care on the making of drawings and templates for each of the separate 450 forms which composed the whole dock, to insure almost mathematical accuracy in the form of each piece, and in the positions of every hole in it. Another advantage of this method is the immense saving of labour in erecting the dock. Under the old plan of shaping each piece of iron so that it would fit only into one special place, it had to be searched for amid thousands of pieces similar to, and yet not capable of being substituted for it. The mere turning over of the innumerable plates and angle-irons in search for individual pieces becomes a source of great expense. Mr Thomson's system rendered this costly and weary toil unnecessary by the fact, that any one of perhaps a thousand pieces that first came to hand would answer equally well. When the material for the docks is discharged from the ships, each of the 450 classes of pieces is piled up by itself, and the workmen have nothing more to do but to take the piece on the top of the pile, perfectly sure that it will fit accurately any of the thousand possible positions to which its class belongs. Another point kept steadily in view by Mr Thomson in designing the Sourabaya Dock was to use only the ordinary forms and sizes of iron made for general commercial purposes. Iron of this kind can always be procured cheaper, and also more readily, than when it has to be made of unusual shapes and sizes. All the iron for the Sourabaya Dock was used just as it came from the rolling-mills. The plates were all flat and rectangular, and the angle and T-iron all straight. The structure was so designed that no bending or heating of the pieces was required. It can easily be imagined that a dock so carefully planned would be cheaply made.

Fig. 2 represents an end view of the dock. The water-tight compartments A, A', B, B', and C, were all completely under the command of the powerful centrifugal steam-pumps, so that they could be separately filled or emptied in a very short time. In fig. 2, the dock is shewn heeled over to one side, for the purpose of getting at the

Fig. 2.

bottom for repairing or cleaning it. This tilting over could be accomplished by filling the compartment A', and emptying all the others. The water-tight compartments were divided in their longitudinal direction into five separate divisions, making in all 25 water-tight compartments, any one of which could be filled or emptied at pleasure; thus affording complete command over the dock, and admitting of its being put into any required level, notwithstanding any irregularity in the distribution of the weight resting on the dock.

FLOATING-DOCKS—FLOATING WAREHOUSES.

The French government had to provide a dry dock at Saigon, in Cochinchina, for the use of the large steamers which had been subsidised by it to run between France and China. The soft muddy character of the soil at Saigon rendered the construction of a stone graving-dock impracticable. The French admiral, commander-in-chief of Cochinchina, hearing of the construction of the Sourabaya floating-dock, and having examined the plans of it, recommended his government to have a similar

dock, on a much larger scale, constructed for Saigon. This great dock has just been erected at Saigon. Fig. 3 is a view of it. The performances of the Saigon Dock are in every way most satisfactory. It has lifted, high and dry out of the water, the 70-gun frigate *Persévérante*, and is capable of lifting any ship in the French navy. Another great dock on Mr Thomson's principle has been erected at Callao, and is likewise answering its purpose admirably. It has lifted out of the water many large

Fig. 3.—Floating-dock at Saigon, with the *Persévérante* of 70 guns. (From a Photograph.)

vessels, among others the United States man-of-war *Waterc*, and the Peruvian iron-clad *Independencia*. The latter ship weighed, when lifted by the dock, 3300 tons. As the Callao Dock floats in an open roadstead, some apprehension was felt that the swell would cause too much movement to admit of ships being safely docked, but it has done its work in the most satisfactory way. None of these iron docks have doors or gates for excluding the water. The bottom part is made of sufficient depth and buoyancy to float the vessels clear out of the water, and the equilibrium of the dock is maintained during the time it is under water, for the purpose of admitting a vessel, by the great displacement offered by the hollow sides, AA' (fig. 2). The total weight of these docks varies from 1000 to 3000 tons, and they cost from £20,000 to £60,000 ready for work.

FLOATING WAREHOUSES. The danger that attends the storing of petroleum and other inflammable and explosive chemicals has led in France to the construction of warehouses, store-

houses, or magazines that will float in a dock or basin, and can be moored at a distance from buildings on land. So far as concerns England, an act of parliament was passed in 1866, relating to the carriage and storing of dangerous substances: it applies more especially to nitro-glycerine, but it gives power to the Privy Council to apply the provisions to other dangerous substances. The precautions, however, go very little further than this, that all casks or packages containing the substance are to be marked 'specially dangerous;' and that every carrier and every warehouse-keeper may exercise a choice as to whether he will warehouse or carry the article or not. In France, as we have said, floating warehouses have been constructed, two being finished in 1864, and others added in later years. They, or some of them, are in a large commercial dock and entrepôt, established at St Ouen, between Paris and St Denis. The construction of the floating fabrics is remarkable. Each warehouse or magazine consists essentially of 100 hollow iron cylinders, arranged in four rows of

25 each, firmly lashed or strapped together to form a kind of raft. Each cylinder, sixteen feet long by six or seven in diameter, has hemispherical ends, with a man-hole at one end. They are placed upright when in position, so as to be filled with petroleum, glycerine, gunpowder, or any other substance, through the man-hole. As they will hold 25 tons each, their united capacity is 2500 tons. There is a wooden covering to the top of the collected mass of cylinders, and round the sides as far down as the line of flotation, to shield the iron from fluctuations of temperature. This covering is made of thick planking, fastened to the cylinders by angle-irons which have been riveted to the latter. At the head and stern are large hawser-holes, to admit hawsers for towing and mooring the floating fabric, bringing it into and taking it out of a basin or dock, and warping it to a quay or dock wall; or, when the vessel is moored in the middle of a basin, far away from buildings, a barge may deliver or receive the dangerous cargo, and thus the vessel be kept altogether away from quays and wharfs.

FLORIDIA, a town of Sicily, in the province of Noto, seven miles west-north-west from Syracuse. It stands in a wide plain, amidst vineyards, olive-groves, and corn-fields. The houses are mostly low and small. Pop. 7030.

FLOTOW, FRIEDRICH VON, a living operatic composer of Germany. Born at Tentendorf, in Mecklenburg, in 1811, he was at first intended for the diplomatic profession; but finding a musical career more congenial to him, he took lessons in composition from Reicha, in Paris. His earlier operas were refused by the managers of the Paris theatres; and his reputation was first established by his music to *Le Naufrage de la Méduse*, produced in 1838 at the Théâtre de la Renaissance, which was a great success. Since then, he has composed various light operas, including *Le Forestier*, *L'Esclave de Camoëns*, *Alessandro Stradella*, *L'Âme en Peine*, *Martha*, and *Rübezah*, which have attained considerable popularity both in France and in Germany, and are characterised by easy and lively dramatic action, readiness of invention, pleasing melody, and graceful instrumentation. *Martha* has, since it was produced in London, become a great favourite in this country. After residing alternately in Paris and his native town, F., was, in 1854, appointed intendant of the theatre at Schwerin.

FOKTCHA'NY, or **FOKTSCHAN**, a town of Walachia, on the Milkov, a branch of the Sereth, 105 miles north-north-east from Bucharest. The Milkov divides Walachia from Moldavia, and a large suburb of F. is in Moldavia. In 1789, F. was destroyed by the Russians. It was burned by the Turks in 1822. The inhabitants are mostly Greeks and Jews. Pop. (1860) 13,164.

FOOD. The food of man is derived entirely from the vegetable and animal kingdoms.

Of animals used for food by man, the catalogue is very large. Savages, impelled by hunger, and unrestrained by any of those opposing considerations which are always powerful with civilised man, eagerly devour almost every animal on which they can lay their hands, vertebrate or invertebrate, and whether in a fresh state or far gone in putrefaction.

There is no vertebrate animal of which the flesh is known to be poisonous or positively unwholesome, except some species of fish, chiefly found in tropical seas. Of vertebrate animals, every class—Mammals, Birds, Reptiles, and Fishes—affords common and much esteemed articles of food. Of mammals, those principally used for this purpose are the herbivorous

quadrupeds, and most of all the ruminants, of some of which the milk also is much employed. The flesh of some of the pachyderms is also used, particularly that of the hog; and that of some of the rodents, as the hare, rabbit, capybara, &c.—although the idea of eating others of the rodents, as mice and rats, would be rejected with disgust by all except savages. The flesh of monkeys is eaten in some parts of the world, although a strong aversion to it is more generally entertained, at least by civilised nations, but probably altogether on the ground of resemblance to the human form; for travellers who have been compelled to eat monkey-flesh, declare it to be very good. The flesh of whales and other ordinary Cetacea is scarcely used except by rude tribes; although that of porpoises was formerly in great request in England, especially during Lent, the porpoise passing for a fish. The flesh of the herbivorous Cetacea, as the manati and dugong of tropical seas, is esteemed. The flesh of some of the herbivorous marsupial quadrupeds, as the kangaroo, is eaten; but that of the carnivorous marsupials and of carnivorous quadrupeds generally is rejected.—The same general remark applies to birds: the flesh of birds of prey is rank, coarse, and unfit for human food; but that of almost all birds which feed on leaves, seeds, and other vegetable substances, or on insects, worms, molluscs, &c., is good for eating. Web-footed birds, particularly the *Anatida*, and gallinaceous birds (including pigeons), are more extensively used than any others; but birds of other orders are also eaten; and some of the small *Insectora*, as ortolans, bec-fins, larks, &c., are brought to market as delicacies.—Of reptiles, one order—that of Ophidian reptiles, or serpents—affords food only to savages; but some of the Chelonian reptiles—turtles—are in high esteem; the Batrachian order contains the frogs, which find a place on the most luxurious tables in some countries of Europe; and to the Saurian order, or lizard-like reptiles, belong species—as the iguanas of South America, creatures of sufficiently uncouth appearance—which, however disgusting to British readers in general may be the thought of eating them, many of their countrymen have learned to esteem as a delicacy. The eggs of turtles and iguanas are also used for food, as well as those of many kinds of birds. Of mammals, birds, and reptiles, the parts chiefly used for food are the muscles or flesh, and the fat; but other parts of some animals are also used, as the kidneys, the lungs, the livers, the stomachs of ruminants (*tripe*), the gizzards of birds, &c.—Very many kinds of fishes are excellent for food, both of cartilaginous and bony fishes; and they belong to many different families.

Of invertebrate animals, some of the molluscs are very generally used. It is unnecessary to do more than name oysters, mussels, and the snails of Italy as examples. Comparatively few molluscs, however, form articles of human food. The same remark applies to crustaceans, although crabs, lobsters, cray-fish, prawns, and shrimps are well-known exceptions. It may almost be said that no articulated animals of any other class are used for food except by savages; the occasional use of locusts and of the larvae of some coleopterous insects (*gru-gru* worms, &c.), scarcely requiring a qualification of the statement. And of the radiated animals, the same general statement may be made; the *Bêche-de-mer*, or *Trepang*—of which, however, the use is almost confined to the Chinese—being the only considerable exception.

Honey, although collected and modified by insects, is rather a product of the vegetable than of the animal kingdom. The same remark applies to a very different substance, the sea-weed gelatine of

which certain swallows of the East Indies make their edible nests.

All the great divisions of the vegetable kingdom yield food for man—the phanerogamous, however, much more largely than cryptogamous plants. Of the latter, the mosses and *hepatica* contain no species that is used for this purpose; the same may almost be said of lichens, notwithstanding the tripede-roche and Iceland moss; but numerous species of *Algae* and of *Fungi* are edible; and a few ferns supply unimportant articles of food. Of phanerogamous plants, it is perhaps impossible to say whether the endogenous or the exogenous are most important in this respect, notwithstanding the place of the cereal grasses among the former. The plants yielding food are also distributed among many natural orders, although some, as *Gramineae*, *Leguminosae*, and *Cruciferae*, contain a large number of the most useful species. The parts of plants which yield food are very various: the roots and tubers, bulbs, &c. of some; the stems of others; leaves; flowers; the fleshy part of fruits; the seed, &c. The part which man appropriates to himself is either used uncooked, or requires to be cooked in order to fit it for use. Sometimes, also, other previous preparations are necessary, as the grinding of corn, &c. Except in the case of ferns, when the cryptogamous or acotyledonous plants are used for food, the whole plant is used, e. g., mushrooms, carrageen, Iceland moss. Sometimes no part of the plant is itself fit for use, but it contains some substance which is, and which man extracts by suitable processes, as in the case of arrow-root, sago, and other kinds of starch, sugar, &c.

The first place among articles of vegetable food must be assigned to *corn*, the seeds of the *Cerealia* (q. v.). The next place, perhaps, belongs to the potato and yam, after which come the banana, cassava or mandioc, and the different kinds of pulse.

Regarded more botanically, the articles of food are—

1. Roots, properly so called, of which the turnip, carrot, parsnip, beet and mangold, cocco or eddoes, may be mentioned as among the most important; but the number of esculent roots and of roots yielding articles of food, is very great.

2. Tubers, of which the potato, yam, and batatas or sweet-potato, are the most important; with the cassava or mandioc and the arrow-root as yielding starch; but of which many others are also used, as the melloco (*ullacus*), the oca (*oxalis*), the earth-nut, &c.

3. Rhizomes, or root-stocks, of which some are simply boiled, whilst others are chiefly valued for the starch (arrow-root, &c.) which they yield.

4. Bulbs, as those of the onion, garlic, shallot, &c. The most important are alliaceous.

5. Stems, which, in some cases, are eaten along with the leaves, whether as salads or boiled vegetables; but of which some are more important as yielding sago and other kinds of starch. The eatable part of asparagus is a stem in the beginning of its growth, and the same statement applies to some other plants; the eatable part of kohlrabi is a peculiar swelling of the stem.

6. Leaves and leaf-buds, as those of kale and cabbage, with other greens of all sorts, spinach, lettuce and all the other salads; the terminal buds of palms (palm-cabbage), &c.

7. Flowers and adjoining parts, as in cauliflower and artichoke.

8. Fruit (exclusive of seeds), used either as a principal article of food, as in the case of the banana, and, to some extent, of gourds, or more generally as an article of luxury. See FRUIT.

9. Seeds, of which the most important are those of the cereal grasses (see *CEREALIA*), along with which must be mentioned those of buckwheat, quinoa, the lotus of the Nile and other water-lilies, the nelumbo, the water-chestnut and other species of *Trapa*, many kinds of pulse, as peas, beans, lentils, kidney-beans, chick-peas, &c., and nuts of many kinds, some of which, as the chestnut and cocoa-nut, afford, in some countries, substantive and important articles of food, whilst the greater number are rather articles of occasional use and of luxury. There are also other seeds which are capable of being used, and are occasionally used as food.

Sugar, which may well be reckoned among important articles of food, is obtained from the juice of stems, as of the sugar-cane, some palms, and the sugar-maple, and of roots, as of the beet, &c. Alcoholic beverages are obtained from vegetable substances and juices which contain sugar, or which, by some artificial process, are, in the first instance, converted into sugar; as the juices of fruits (the grape, apple, &c.), the juices of stems (the sugar-cane, palms, &c.), the juices of roots and tubers (beet-root, potatoes, &c.), and the seeds of the cereal plants (barley, rice, &c.).

Besides the substantive articles of food, and beverages more or less generally used, there are very many condiments, which are obtained from the vegetable kingdom, and of which the botanical sources are almost equally various, as mustard, pepper, ginger, cloves, capers, &c.

FORTUNE, ROBERT, a distinguished botanist and traveller, was born in the county of Berwick in 1813. After completing his education at a Scotch parish school, he served an apprenticeship as a gardener, and obtained employment in the Royal Botanic Garden at Edinburgh. There he had good opportunities of obtaining a sound knowledge of botany and the higher departments of his own profession, so far as they relate to the cultivation of subtropical and tropical plants under glass in a temperate climate, and these opportunities he turned to good account. He afterwards obtained a situation in the gardens at Chiswick, where his abilities and acquirements attracted the attention of London naturalists. He was, in 1842, sent by the Botanical Society of London to Northern China to make a botanical exploration of the country. His journey was most successful, and he sent home a very large number of new and valuable plants. He gave an account of his adventures in his *Three Years' Wanderings in Northern China*, a work which places its author in the foremost rank of contemporary explorers. F., on his return to England, acted for a time as curator of the Physic Garden at Chelsea. In 1842, he was appointed by the East India Company to proceed to China to make investigations relative to the cultivation of the tea-plant; and on his return to England he published a work entitled *Two Visits to the Tea Countries of China*. He has since been employed by the American government to collect for them seeds, chiefly those of the tea-plant, in the East. The latest important work by F. was published in 1863. It is entitled *Yedo and Peking, a Narrative of a Journey to the Capitals of Japan and China*. It devotes special attention to the natural productions and agriculture of the districts visited.

FORT WAYNE, a flourishing town of the state of Indiana, North America, at the confluence of the St Joseph and St Mary rivers, which form the Maumee, and on the Wabash and Erie Canal, 122 miles east-north-east from Lafayette. It is a great railway centre, and its growth has been very rapid.

A fort was erected here by order of General Wayne in 1794, and it continued to be a military post till 1819. Pop. (in 1860) 10,388.

FOULA, or FOULAH, an island of Shetland, parish of Walls, from which it is distant 20 miles in a westerly direction. It extends 3 miles in length by 1½ in breadth, and rises to a height of 1369 feet

Fig. 1.—General Appearance of Foula from the Sea.

above the sea. It is solitary, and with it there is no regular communication. F. has about 250 inhabitants, who subsist by fishing and farming on a small scale. On the island, there is a school maintained by the Society for Propagating Christian Knowledge; there is also a chapel connected with the Church of Scotland, and a chapel with a missionary maintained by the Congregational Union of Scotland. F. is chiefly remarkable for its sublime cliffs of red sandstone on its north-western side, where the precipice rises from the sea-margin to a height of nearly 1200 feet, being the grandest thing of the kind in the British Islands. Among the sea-birds which occupy the cliffs is the Skua Gull, or Bonxie (*Lestris calaractes*). Of this powerful bird there are about 13 pairs, which are prized by the natives for their services in keeping down the numbers of the eagles on the cliffs. The landing-place on F. is at a scattered hamlet of wretched thatched huts on the south-east. Here there is a store, at which imported

Fig. 2.—A Foula Hut.

commodities are bartered for fish and other articles, and at which an apartment is let to strangers, there being no inn. F., however, is rarely visited by strangers, and little is known of it even in Scotland.

FOURCHAMBOULT, a rapidly increasing town of France, in the department of Nièvre, five miles north-north-west from Nevers, near the right bank of the Loire, which is here crossed by a suspension bridge. It is a station on the railway between Orleans and Nevers. There are great iron-foundries, employing between 2000 and 3000 workmen. The manufacture of arms is extensively carried on. Pop. (in 1866) 6280.

FRA'GA, a town of Spain, in the province of Saragossa, 63 miles west by south from Saragossa, on the left bank of the Cinca, which is crossed by a suspension bridge. The town stands on a slope,

and is poor and half-ruinous, with ill-paved streets. The environs abound in pomegranates and figs. The small green figs of this district are celebrated as particularly delicious, and when dried form the chief article of export. F. is supposed to occupy the site of the ancient *Gallica Flavia*. Pop. 5028.

FREDERICK-CHARLES, a Prussian prince, son of Prince Charles (brother of King William), was born at Berlin, 20th March 1828. In his early youth, he manifested a great liking for warlike occupations; and the first Slesvig-Holstein war (1849) saw him in the field as captain, and not without honour to himself; in the campaign in Baden also he gathered laurels and honourable wounds; and in the second Slesvig-Holstein war his name became famous through the storm of the Düppel entrenchments. But his chief title to fame rests on the part he played in the campaign of 1866 against Austria, where he commanded one of the invading armies, and where his able generalship contributed not a little to the final success of the war. He has indeed been blamed for excess of caution in advancing through Bohemia to the rendezvous at Gitschin, where his more prompt appearance, it is said, would have saved the Silesian army from the danger of serious disaster which it encountered in passing the defiles; but it may, in fairness, be assumed that the caution was necessary until the contrary is proved.

The prince is not only practically but theoretically distinguished in his profession. Besides his services in the reorganisation of the cavalry, he has written several military works of great merit; one of them, entitled *How to Beat the French*, attracted a good deal of attention when it appeared.

The prince is a soldier from his very heart, and as such, much esteemed and liked by both officers and men. He was married to Marie Anna, Princess of Anhalt, in 1854.

FREDERICK CITY, a city of Maryland, U. S., two miles west of the Monacacy River, 44 miles north-west of Washington, 65 by railroad west of Baltimore, on a branch of the Baltimore and Ohio Railroad; a handsome town with 12 churches, three banks, college, academy, seminaries, two newspapers, and manufactories of iron, wool, leather, flour, and tobacco. Pop. (1860) 8142.

FREDERICKSBURG, a city of Virginia, U. S., is built in a fertile valley on the right bank of the river Rappahannock, at the head of tide-water, 110 miles from Chesapeake Bay, 65 miles north of Richmond, and had, in 1860, the county buildings, five churches, two seminaries, orphan asylum, and extensive manufactories of flour and tobacco, and a pop. of 5022. December 13, 1862, it was the scene of a battle between the Federal army, commanded by General Burnside, and the Confederate army under General Lee, in which the former was repulsed, and driven back across the river with a loss of 12,321, while the Confederates, strongly posted on the hills south of the city, suffered but trifling damage; but the city itself was nearly destroyed.

FREDERICK-WILLIAM, Crown-prince of Prussia, only son of King William (q. v.) of Prussia and Queen Augusta, *née* Duchess of Weimar. Born 18th October 1831. His earnest character and eminent talents were early developed under the care of excellent masters, among others of Ernest Curtius (q. v.), who also accompanied him to the university of Bonn, where the prince was matriculated in the law faculty. After the completion of his education, the prince visited several foreign countries, among others, England, where it seems he became attached to the Princess Royal, eldest

daughter of Queen Victoria, and was married to her on the 25th January 1858, with the highest approbation of both nations. Of the issue of this union, there are now living two sons (the eldest, Frederick-William, born 27th January 1859). Since his father ascended the throne, the crown-prince has taken part in the more important affairs of state. He served in the Danish campaign in a subordinate capacity; nevertheless he gave sufficient proofs of his great ability to cause the king to intrust to him an important (according to some, *the most important*) task in the war with Austria in 1866, namely, the command of the left Prussian wing operating in and from Silesia. How ably the prince played his part, and how his timely appearance on the battle-field of Königgrätz decided the fortune of the day, is well known (see GERMANY, in SUPPLEMENT).

Through the brilliant results of the war, the Prince and the other members of the royal family have acquired a popularity among the Prussian people which they by no means formerly enjoyed. The crown-prince is said to be of a noble, frank, and humane character. His figure is tall and manly, and his features unusually handsome.

FREGENAL DE LA SIERRA, a town of Spain, in the province of Badajoz, and 30 miles south-east from Badajoz. It stands in a valley among mountains on the right bank of the Martiga. The streets are wide and well paved, and the houses in general well built. There is an ancient castle, erected by the Templars, within which is the bull-ring, capable of containing 4000 people. Leather and linen fabrics are extensively manufactured. Pop. 5975.

FREIRIRA, a seaport of Chile, in the province of Atacama, at the mouth of the Guasco. It is a place of some trade. Pop. 10,000.

FRESNILLO, a mining town of Mexico, in the state of Zacatecas, 30 miles north-west from Zacatecas, on a feeder of the Santiago or Tololatlán. It has a spacious square, in the centre of which is a splendid fountain. In the neighbourhood are silver and copper mines, which are among the most productive in Mexico. Pop. 12,000.

FREUDENSTADT, a town in Würtemberg, and capital of a bailiwick of the same name, in the circle of the Black Forest, 40 miles south-west of Stuttgart, is situated on a rock which is washed by the Murg. It was founded in 1599 by Duke Frederick., and peopled by Protestant refugees from Austria. It has a considerable trade in wood, cattle, and fruit. Cotton-spinning, weaving, bleaching, smith-work, especially making nails, &c., are the principal industries. The town is regularly built. It has a good market-place with arcades, and a grammar-school. The environs are beautiful, and present many interesting prospects. Pop. (1864) 5131, early all Protestants.

FREYSTÄDTL, **FREYSTADT**, or (Hung.) **ALGOCZ**, a town of Hungary, in the circle of Eutra, 84 miles north-west from Pesth, on a height above the left bank of the Waag, opposite to Leopoldstadt. The Waag is here crossed by a long bridge. F. contains a fine castle belonging to Count Clodius, situated on a steep limestone cliff, with fine gardens. There is also a curious round tower, supposed to have been a Turkish minaret. Various articles of wood are extensively manufactured. There are important cattle-markets. Pop. 6098.

FRIEDEBERG, a walled town of Prussia, in the province of Brandenburg, 56 miles north-east from Frankfurt, on the Peza. Around it are several lakes. It has woollen manufactories and

tanneries, and some trade in cattle. Pop. (1864) 5895.

FUENTÉ A'LAMO, a town of Spain, in the province of Murcia, 18 miles south from Murcia, at the northern base of a range of hills, and at a short distance from the canal of Murcia. Pop. 6250.

FUERTÉ DE ANDALGA'LA, sometimes more briefly called **ANDALGALA**, a town of the Argentine Confederation, in the province of Catamarca, 72 miles north by west from Catamarca, in a mountainous district. Pop. 5500.

FUERTE, or **VILLA DEL FUERTE**, a town of Mexico, in the province of Sinaloa, 75 miles north by west from Sinaloa, on the Rio del Fuerte, which flows into the Gulf of California. It is a place of some commercial importance. Pop. 8000.

FUNARIA, a genus of Mosses, with terminal fruit-stalks, and oblique double peristome, both the inner and outer having sixteen teeth. A few species are found in Britain, one of which, *F. hygrometrica*, is an object of particular interest on account of the hygrometric properties of its fruit-stalk, which, if moistened in the lower part, twists several times round in one direction; and if moistened in the

Funaria hygrometrica :

a, plant, natural size; b, leaf, magnified; c, capsule, magnified; d, capsule, magnified, with lid removed.

upper part, twists several times round in the opposite direction. This is owing to a peculiar arrangement of the cellular tissue, which is spiral in one direction at the base of the stalk, then straight, then spiral in the opposite direction. The structure of the fruit-stalk has been closely examined and commented on by Dr Lankester (*Annals of Nat. Hist.*, vol. iv.). *F. hygrometrica* has very concave, ovate, entire, apiculate leaves. It is very common on old buildings and on dry barren soils; and is said to be almost always found where a wood-fire has been burning on the ground, as on the site of gipsies' encampments, &c.

FÜNFHAUS, **FÜNFHÄUSEL**, or **HA'NGEN-DENLISSEN**, a town of Austria, in the circle of Unt, about 2 miles north from Vienna. It has silk, satin, woollen, cotton, and red leather manufactures. Pop. 13,639.

FUSA'RO, LAKE OF, a small lake of South Italy, in the province of Naples, 11 miles west from Naples, on the peninsula of Baisa. It is not far from the site of the ancient Cuma, of which it is supposed to have been the port. Numerous remains of massive buildings, villas, and tombs are still to be seen in the neighbourhood. At the southern extremity of the lake is a canal of Roman construction,

communicating with the sea, now known as the *Foce del Fusaro*. The water of the lake is brackish, more salt than fresh. The lake is famous for its oysters, which have been cultivated here (see OYSTER) since the times of the ancient Romans. They are larger and of finer flavour than those of the Bay of Naples. The lake is supposed to be the crater of an extinct volcano; and, in 1838, great quantities of noxious

gases were emitted, by which the oysters of the lake were killed. The lake of F. received from the ancients the name of *Acherusia Palus*, probably at first bestowed on it by the Greeks of Cuma in consequence of its proximity to Avernus, and its crater-like character. In the later times of the Roman Empire, however, its banks were adorned with the villas of wealthy Romans.

G

GADJA'TCH, or **GADITCH**, a town of South Russia, in the province of Poltava, and 65 miles north-by-west from Poltava, at the confluence of the Khoral with the Psiol. It has seven churches and a monastery, and an active trade in agricultural produce. Pop. (1863) 8312.

GAJ'SIN, or **GAJSSIN**, a town of South Russia, in the government of Podolia, 172 miles north-by-west from Odessa. Pop. (1863) 9630.

GALLARATÉ, a market-town of North Italy, in the province of Milan, and 24 miles north-west of the city of Milan. It is situated on the eastern side of the Somma Hills, at the commencement of the fertile region that extends to Milan, with which place it is connected by railway. It is well built, and surrounded by ancient walls; has extensive steam cotton-mills, and an active trade in agricultural produce. Pop. 4484.

GALLIA'TÉ, a town of North Italy, in the province of Novara, four miles east-north-east from Novara. It is rather a mean and dirty town, with an old castle and an old church. There are silk-mills here, and cotton-stuffs are also manufactured. G. has an annual fair, which lasts three days. Pop. (1861) 6503.

GANGI, a town of Sicily, in the province of Palermo, 53 miles south-east from Palermo. It occupies the summit and slopes of a steep and lofty hill. A more ancient town of the same name stood two miles to the south, and is supposed to have occupied the site of the ancient *Enguim*. The old town of G. was destroyed in 1299 by Frederick II., for the rebellion of Francesco Ventimiglia, its feudal lord. One of the best Sicilian painters of the 17th c., Giuseppe Salerno, was born here, and is generally known as *Lo Zoppo di Gangi*, from his lameness. One of the churches contains a much-admired painting of the 'Last Judgment,' from his hand. Pop. (1861) 10,535.

GANGS, **AGRICULTURAL**, a name specially given to companies of women, and boys and girls, brought together for labour in the fen-districts of England, or the low and level tracts which lie south of the Wash in the counties of Lincoln, Cambridge, Norfolk, Suffolk, and Rutland. Not many years ago, the part of the country referred to was a marsh crossed by streams which had not the necessary fall to carry their waters to the sea. Dykes and canals have, however, been constructed to drain the wilderness, and it has been converted into one of the most fertile agricultural districts of England, producing magnificent crops of every kind. While the surface supported only scanty herds, and was overhung with malaria, it had no inhabitants. It might have been expected that when covered

with corn-fields, an agricultural population would have spread into it, and that houses would have been erected for their accommodation. This, however, is not the case. English landlords shun the responsibility incurred under the existing poor-law, by the erection of houses for labourers; and capitalists avoid an investment which is never found profitable. The reclaimed land is accordingly cultivated by labourers brought from the villages, which are numerous on the high ground that borders it; and, to save expense, they consist, as much as possible, of women, girls, and boys, paid at the lowest rate given in England for agricultural labour. They work in two kinds of gangs—private and public. The former consist of from 12 to 20 persons, and are directly hired by the farmer, and placed under the charge of an agricultural labourer. The population so employed numbers 20,000. The public gangs are hired by a class of contractors known as gang-masters, who personally superintend and pay the labourers. Each public gang consists of about 30 persons, and the total number so employed is 7000. They plant potatoes, thin turnips, weed with the hoe or hands, and pull turnips and beet. Their squalor and immorality have long attracted notice, and, two years ago, Lord Shaftesbury called attention to it in the House of Lords. A Royal Commission was appointed, and their Reports have been published. They give a picture of this system of labour, which is declared to be even more horrible than any given of American slavery by Mrs Stowe. The gangs consist, in large proportion, of girls and boys from 11 to 17 years of age, who not only work six days a week in the fields from 8 to 5 o'clock, but must go to and from their work. The distance in some cases is 16 miles, so that they are compelled to leave their homes before 5 in the morning, and to return after 8 at night. Children of 6 are even pressed into the service. While at work, the gang-masters compel the weak to keep pace with the strong, and often do so by striking and kicking them with the utmost brutality. The gangs often work ankle-deep in mud; they trudge all day through standing corn, wet with rain and dew; and they frequently return wet up to the waist. Colds and rheumatism impair their health, and it is needless to say they lose all self-respect, and become quite unfit for household duties. The worst remains to be told. The boys and girls return home without any control on the part of their seniors, often in the dark, and the greatest profligacy is the consequence. Their precocity exceeds that of the most neglected town populations, and the number of girls under the age of 17 who become mothers is perfectly frightful. Among the last acts passed at the close of the session 1866—1867 was one for the regulation of agricultural gangs. It applies exclusively to England, is to come into operation on 1st January

1868, and provides that, after that date, no woman or child is to be employed in the same gang with men or boys, and that no woman or girl is to be employed in any gang under a male gang-master, unless a woman licensed to act as superintendent is also present with the gang. Licenses are to be granted by justices in divisional petty-sessions for six months, and for acting without a license the penalty is to be twenty shillings a day. Proof is to be given to the justices that the applicants are proper persons to be licensed; and they may annex conditions as to the distances within which children are to be allowed to travel to their work. The evil, it was believed, is too deeply rooted to be dealt with by one enactment, and it is expected that the present act will be followed by more sweeping measures.

GANGUE (Ger. *Gang*, a vein), the stony matrix in which metallic ores occur. Quartz is the most common gangue, but calc-spar is also very frequent, sulphate of barytes and fluor-spar not unfrequent. Large portions of the gangue are generally worked and submitted to metallurgic processes for the sake of their contents.

GAS-ENGINE. Many attempts have been made to utilise, as a motive-power, the expansive force arising from the explosion of a mixture of common coal-gas, such as is in general use for illuminating purposes, and common air. The only attempt of this kind which has had a considerable success is that of Lenoir, a French inventor. The cut represents his engine. It resembles in its general features

Gas-engine :

A, electric battery; B, distributor of electricity; C, electric igniters; D, admission of air (atmospheric); E, admission of gas (common coal-gas); F, exhaust-pipe; G, water-pipe (inlet); H, water-pipe (outlet); I, India-rubber pouch.

an ordinary horizontal steam-engine. It has two slides, one on each side of the cylinder, which are opened and closed by eccentrics in the usual way. Through one of the slides, air and gas flow into the cylinder, in the proportions of about 11 of air to 1 of gas, until the cylinder is nearly half full, when the connection with the galvanic battery is made by the revolution of the shaft at B, causing a spark inside the cylinder, and consequent explosion of the mixture of air and gas. This explosion forces the piston from the middle of the cylinder to the further end. The products of the explosion then escape from the cylinder by the other slide-valve, which opens at the proper instant. The momentum which the fly-wheel has now acquired will carry the piston back to the middle of the cylinder, sucking in behind it, through openings, which are made by the action of the eccentric on the slide, a fresh supply of air and gas; and when the piston has reached to the middle of the cylinder, the further inflow of air and gas is stopped by the slide closing, and at the same instant a spark of electricity is sent into the air and gas, exploding it as before. The first half of the stroke of the piston is thus

employed in sucking in the requisite quantities of air and gas, and the last half of the stroke giving off the power arising from the explosion of the mixture of air and gas. Notwithstanding the high first cost of this engine, for it exceeds that of an ordinary steam-engine (including boiler) of equal power, it has come into rather extensive use, especially in France. It is much used in Paris in hoisting up the builders' materials in the great building operations going on there, and also for numerous purposes where a power of two or three horses only is required. The gas-engine requires no stoker, and the saving of the wages of this attendant turns the scale of economy in favour of the gas-engine, when his wages exceed the outlay for coals. It consumes about 50 or 60 cubic feet of gas per hour for each horse-power, or about 1000 cubic feet per day for an engine of two horse-power—say 24s. per week. Now, it is obvious that the wages saved by dispensing with a stoker will go far to pay the total cost of keeping the engine going. The difficulties attending its use arise from the heat developed by the explosions in the cylinder, which burns the lubricating material necessarily used to make the piston slide easily on the cylinder. However, by keeping a current of cold water slowly circulating through the jacket of the cylinder, the heat is kept within moderate bounds; and for purposes where a very small power is required, not exceeding 2 or 3 horses, and where gas does not cost more than 4s. or 5s. per 1000 cubic feet, it can be kept going for less cost than a small steam-engine of equal power. In consequence of the piston doing useful work for one-half of the stroke only, the cylinder requires to be considerably larger than the cylinder of a steam-engine of equal power. A 2 horse-power gas-engine has a cylinder 8 inches diameter, and 16 inches stroke. A high-pressure steam-engine of this size would be 6 horse-power at least.

GAS-LIGHTING IN RAILWAY TRAINS.

Many methods have been tried within the last few years for lighting railway carriages with ordinary street gas; but, although tolerable success has been obtained, no one plan has yet completely fulfilled all the conditions of the case.

The more prevalent schemes are those in which the gas is contained in an elastic receptacle. Mr Allen's plan, tried on some of the Scotch railways, is to place an india-rubber bag or box in the guard's compartment; it is protected by iron rods or bands, and weighted to press out the contents as the exhaustion goes on. The bag is filled with gas at the station from whence the train starts. A tube from the bag passes out by an opening from the van, and leads up to metal pipes that run along the roofs of the carriages. An india-rubber tube forms an elastic link from carriage to carriage; and small pipes bend down through the roof to supply burners in the interior of each carriage. The guard can regulate the supply, making the lights brighter or dimmer by easy apparatus under his control. The chief disadvantage of such plans as this is, that no carriages can be added to or deducted from the train without disturbing the arrangements, seeing that the tubing forms a connected system from end to end.

Mr Dalsiel's plan, tried on the South-eastern and the Great Northern lines, enables each carriage to maintain its light irrespective of the others in the train. There is a reservoir underneath the floor of the carriage; consisting of a boiler-like wrought-iron vessel, nine or ten feet long by a foot and a half in diameter; it is invisible, and in no way incommodes the passengers. It is filled at the station, before the train starts, with gas enough to last all the burners in the carriage during a double

through-journey to some distant station and back again. Pipes lead up the ends of the carriage, and along the top to the spots where they bend down to supply the burners. The gradual exhaustion of the reservoir would produce a constantly decreasing pressure on the gas, and a consequent dimness of the light; but this is prevented by the use of an automatic compensating valve, which maintains the pressure equably. The gas, in the first instance, is forced into the reservoir at a pressure of 120 lbs. on the square inch.

The Metropolitan or Underground Railway, running for so great a part of its length through a dark tunnel, would be insupportably gloomy if the carriages were not well lighted. A very brilliant system of gas-lighting is therefore adopted. At the Paddington or Bishop's Road Station, before the starting of each train, gas is conveyed from a gas-holder up through elastic tubes to the top of each carriage, where an oblong box extends from end to end. This box or chest contains enough gas to last for two short journeys, supplying from 12 to 16 burners for each carriage. The briefness of the journeys renders practicable here a plan which would not be available for a journey of several hours.

GEMONA, a town of Venetia, 15 miles north-by-west from Udine, on a feeder of the Tagliamento. It is situated in a deep basin among mountains, and is a well-built town, surrounded by walls. G. has a large transit-trade, and two important annual fairs. Pop. (1857) 6583.

GENZANO, or **GENSANO**, a town of the Papal State, Italy, 17 miles south-by-east from Rome, in a district of hills and ravines. G. has several broad and straight streets, proceeding from a handsome square, which is ornamented with a beautiful fountain. On one of the hills above the town is the feudal mansion of the Cesarini family. G. is celebrated for an annual festival, held on the eighth day after *Corpus Christi*, called the *Inforata di Genzano*, from the custom of strewing the streets with flowers, so as to represent arabesques, heraldic devices, figures, &c. On occasion of the festival, many visitors are attracted from Rome. Pop. 5000.

GERANIA *CEÆE*, a natural order of exogenous plants, consisting of herbaceous plants and shrubs, of which about 500 species are known, distributed over the whole world, and particularly abundant in South Africa. The stems are jointed, usually tumid, and easily broken at the joints. The leaves are simple in some, divided in others, opposite, or alternate, with flower-stalks opposite to them; they have membranous stipules. The calyx consists of five persistent sepals; the corolla of five petals, which are clawed. The stamens are united by their filaments, hypogynous, twice or thrice as many as the petals. The ovary consists of five carpels, placed around a long awl-shaped *torus* or *carpopore*, to which the styles cohere; ripening into a fruit which consists of five small one-seeded shells, cohering around the base of a long beak, the indurated style of each carpel finally curling back from the base upward, and carrying the seed along with it. The indurated styles are in many species extremely hygroscopic, and their twistings and untwistings seem intended to move the seed after it has fallen, until it reach a fit place for its germination. See **GERANIUM**.

GERMANY. Since the article on G. was written, important changes have taken place in the political relations of its component parts; and we propose here to give some account of these changes and of the war which led to them. The immediate occasion of the war was the difference that arose between

Prussia and Austria as to the occupation and disposal of the territory taken from Denmark (see **SLESVIG**) after the Convention of Gastein (1865). But the real grounds lay in that rivalry between the two states for the leadership of G., the germ of which is as old as the time of the Great Elector (see **FREDERICK-WILLIAM**), and which has shewn itself at many epochs of the history (see **GERMANY, History**). There can be little doubt that the feeling of the German people, as distinguished from the princes and bureaucracy, has, in recent times at least, been in favour of the purely German Prussia as their leader, rather than Austria, the great mass of whose population are Slaves and Magyars. And when the parliament of Frankfurt, in 1850, offered the imperial crown to the king of Prussia, the unity of G. might have been secured without bloodshed, had the monarch been resolute, or had he had a Bismark for his adviser. But that opportunity being let slip, and the incubus of the 'Bund' being restored, it became apparent that the knot must be cut by the sword.

By the treaty of Gastein, Austria and Prussia agreed to a joint occupation of the Elbe duchies; but to prevent collision, it was judged prudent that Austria should occupy Holstein, and Prussia Slesvig. Already a difference of policy had begun to shew itself: Prussia was believed to have the intention of annexing the duchies; while Austria began to favour the claims of Prince Frederick of Augustenburg, and wished to refer the disposal of the matter to the Bund. In the meantime, both nations were making ready for the struggle. In fact, the preparations of Prussia had been going on for two or three years; and the new organisation of her army, which had occasioned the protracted contest between the government and the house of deputies, had been made with a view to some such eventuality as was now to occur. The preparations of Austria were made more openly, as she could plead the necessity of meeting the warlike attitude of Italy; which power, looking upon the quarrel between Austria and Prussia as a precious opportunity, was actively arming, with a view to strike a blow for the liberation of Venetia, and had secretly entered into an alliance with Prussia.

At this crisis, England, France, and Russia invited the disputants to a conference. Prussia and Italy readily consented; but nothing came of it; through the obstinate pride of Austria, who would not allow her position in Italy to be even taken into consideration. Never, perhaps, was a greater blunder made. Had she at this moment ceded Venetia for a reasonable compensation, she would have replenished her empty treasury with a good many millions, have made Italy friendly, or at least neutral, and set free her best army of 80,000 veterans for the inevitable contest with her northern rival. A few weeks later, she made the concession with a bad grace, without compensation, and to no purpose.

On the failure of the conference, Benedek, commander-in-chief of the Austrian army of the north, issued an order of the day, dated 12th May, in which he announced that he had been appointed 'to lead the brave and faithful Austrian army against the unjust and wanton foes of the empire.' It only remained to find a formal ground for the declaration of war, and that ground was found in the Slesvig-Holstein question. In the sitting of the German diet, June 1, 1866, Austria, disregarding the Convention of Gastein, placed the whole matter at the disposal of the Bund, and then proceeded to convoke the states of Holstein 'to assist in the settlement of the future destination of the duchy.' Prussia protested against this as an insult and a violation of treaty; demanded the re-establishment of the joint

occupation; and, while inviting Austria to send troops into Slesvig, marched troops of her own into Holstein. Instead of responding to this invitation, Austria withdrew her forces altogether from Holstein, under protest; and, then, calling attention to this 'act of violence' on the part of Prussia, proposed that the diet should decree 'federal execution' against the enemy of the empire. This eventful resolution was carried by a great majority on the 14th June 1866; Hanover, Saxony, Hesse-Cassel, Hesse-Darmstadt, and the 16th Curie voting for it. The resolution having passed, the Prussian plenipotentiary, in the name of his government, declared the German Confederation dissolved for ever, and immediately withdrew.

When the news of the federal execution was received in Berlin, identical notes were sent to the courts of Saxony, Hanover, and Hesse-Cassel, demanding the reduction of their armies and assent to the convocation of a common German parliament; on which condition, Prussia would guarantee their territories and sovereign rights as her allies. Twenty-four hours were allowed for the decision; and when the term had expired without assent, the Prussian troops, which had previously been concentrated on the frontiers, crossed at once into the three kingdoms, and took military possession without resistance. The Saxon army retired into Bohemia, to join the Austrians; that of Hanover, after vainly trying to make its way south to join the army of the Bund, and bringing on the useless affair of Langensalza, was forced to lay down its arms, and return home.

Besides the moral advantage gained by this display of promptitude in paralysing her declared enemies and securing the adhesion of waverers, Prussia had by these occupations secured her rear, and, in Saxony, had won a favourable basis for operating against Austria. The Prussians now lost no time: war was declared against Austria; and, following the example set by Frederick the Great, the troops immediately began to march into Bohemia. To their own surprise, as well as that of all Europe, they were allowed to pass the easily-defended defiles without opposition, or even seeing an enemy. So great was the reputation of Benedek, that every one now began to look for some deep-laid plan by which the enemy was to be enticed into the heart of the country, only to be completely and at once overwhelmed. But, as it turned out, there was no plan at all. With their usual sluggishness, the Austrians were taken by surprise in a state of unreadiness—ill organised, ill equipped, ill provisioned; and although in actual engagement the soldiers fought bravely, they were animated with a very different spirit from their opponents. The Prussian people had at the outset been rather averse than otherwise to the war; and in some places, it required strong measures to make the Landwehr take the field. But once under arms, and as the object of the struggle became more apparent, they entered into it with enthusiasm, and manifested a rare combination of soldierly qualities, the results of a universally diffused education, and military training. And while such was the quality of the men, seldom if ever has an army taken the field so well organised, with the plan of the campaign so well laid, the arms so efficient, and the equipments in every way so complete.

The Prussian host invaded Bohemia at three several points: the central army, under Prince Frederick-Charles (q. v. in SUPPLEMENT), entered from Eastern Saxony, crossing the frontier range of the Erzgebirge by Krottau, Friedland, and Neustadt, towards Reichenberg; the western or 'Elbe' army, under General Herwarth von Bittenfeld, started from Dresden, and entered Bohemia by Neustadt

and Schlukenau towards Gabel; while the eastern or 'Silesian' army, under the Crown-prince, Frederick-William (q. v. in SUPPLEMENT), invaded from Silesia by the Landhut and Nachod passes, marching towards Trautenau and Skalitz. The first of these armies numbered 72,000 infantry, 11,000 cavalry, and 294 guns; the second, 34,000 infantry, 3,900 cavalry, and 132 guns; and the third, 92,000 infantry, 12,500 cavalry, and 348 guns—in all, 225,400 men, and 774 guns. To oppose these, the Austrians had 55,000 infantry, 5,400 cavalry, and 172 guns (inclusive of the Saxon army, which had been withdrawn into Bohemia on the approach of the Prussians), under Count Clam-Gallas, stationed along the frontier north of Turnau and Leitmeritz; and 186,000 infantry, 16,000 cavalry, and 544 guns, under Marshal Benedek, the commander-in-chief, in Eastern Bohemia, behind the Riesengebirge—in all, 262,400 men, and 716 guns. As the Austrians expected the attack from Silesia, by far the greater portion of their army was stationed behind the Riesengebirge; so that when Von Bittenfeld and Prince Fr.-Karl crossed the Erzgebirge (June 24), they found themselves opposed by only the outlying brigades of Clam-Gallas, which they forced to retire towards Turnau and Münchengrätz, after defeating them in some insignificant combats at Reichenberg, Langenbrück, Liebenau, and Turnau, and in a severe struggle at Podol, which cost the Austrians in all 2,400 in killed, wounded, and prisoners; the loss of the Prussians being only 124 men. The first and second Prussian armies, now united, advanced leisurely, driving the enemy before them towards Münchengrätz, where Clam-Gallas had strongly posted himself, and where, on June 28, he was attacked by the combined Prussian armies, and after a brief but severe contest, forced to retreat in haste. By several routes, the combined armies under Prince Friedrich-Karl now continued their onward march, routing the detached corps of Austrians and Saxons which attempted to bar their progress; and after a severe contest (June 29), which cost the Prussians 2,000 men, and the Austrians about twice as many, took possession of Gitschin, and encamped on the following morning between that town and Horzitz, having established communications with the Crown-prince; while Clam-Gallas retired to join the main body under Benedek, after having, with a force only half as numerous as his opponents', and still more inferior in guns, compelled his antagonists to spend six days in making an advance of 40 English miles.

Meanwhile, the third Prussian army had advanced in two divisions, the right wing through the passes of the Riesengebirge by Landhut, towards Trautenau; the left by Glatz, towards Nachod and Skalitz; while the centre divisions crossed by Braunau, all crossing the frontier on June 26. The defiles were traversed without opposition, the Austrians being only posted at the mouths of the passes; but as the left wing under Steinmetz debouched towards Nachod, it was assailed (June 27) by Ramming's Austrian corps, and driven back into the pass. Steinmetz, however, persevered; and by the aid of his guns, and repeated charges of cavalry, succeeded, after a conflict of six hours, in extricating his corps from the defile, at a cost of 1,191 killed and wounded, to 6,000 on the part of the Austrians. Both armies being reinforced, the contest was renewed at Skalitz on the 28th; but, though long and bloody, it was on all sides favourable to Steinmetz, who beat the Austrians back upon Josephstadt, with a loss in killed and wounded of 5,815, and 5,850 prisoners, with five guns. The Prussian right wing, under Bonin, had also a double conflict with the Austrians, who were posted to receive them; for, after extricating themselves from the Landhut defile,

and seizing Trautenau, they were met (June 27) by General Gablentz, and, after a long-continued fight, were driven back to their previous camping-ground, losing, however, only 1423 men, to about 3500 of the Austrians. Gablentz being much exhausted with his hardly-won victory, obtained reinforcements from Benedek; and the Prince of Württemberg, with a corps of Guards, being sent by the Crown-prince (who marched with the centre, ready to afford support to either wing when necessary) to attack Gablentz by Eypel, fell upon him (June 28) while he was preparing to complete the defeat of Bonin, and, after a severe combat, or rather series of partial unconnected combats, the Austrians were this time defeated, with a loss of 4000 men, and an equal number of prisoners; the Prussian loss being only 834 killed and wounded. The three Prussian armies having thus effected a firm lodgment in Bohemia, moved steadily forward in lines, converging to a point north of the Austrian army, which was now concentrated between Josephstadt and Königgrätz; and the king of Prussia, who had arrived (July 1) at the head-quarters of the 1st and 2d armies, hearing of Benedek's intention to assault them before the Crown-prince's army could come to their aid, resolved to anticipate him, and ordered an attack on the Austrian position at 8 A.M. on July 3, at the same time sending off an urgent dispatch to hasten the arrival of the Crown-prince, whose host, at 8 A.M. on the 3d, was 15 miles off. The Prussians, at the commencement of the fight, believed they had to do with only the half of the Austrian army, but they were soon undeceived, for, after carrying the villages in front of the Austrian position, and advancing up the slope, they were met by such a crushing fire of artillery as completely stopped their further progress. Benedek then directed his reserves against the Prussian left, in order to cut it off from the Crown-prince, but all his endeavours to drive it permanently from its position failed. The conflict, which was mainly an artillery-fight, thus continued without intermission, and the Prussian left was almost on the point of giving way before the overwhelming numbers of its assailants, when the wavering of the Austrian right unmistakably shewed that a portion at least of the third army had arrived, and attacked them in flank. This new assailant becoming more formidable every minute, speedily rolled up the Austrian right wing; and the advance of the 1st and 2d armies, by partially enclosing the Austrians between two fires, threw them into great confusion. Their array was soon broken, and dissolved in precipitate flight; multitudes perished in the morasses, in the waters of the Elbe, and under the wheels of the fleeing baggage-wagons; but the undaunted attitude of the splendid Austrian cavalry, and the deficiency of the Prussians in that arm, greatly mitigated the horrors of the rout. The Prussians lost upwards of 9000 killed and wounded; the Austrian loss was 16,235 killed and wounded, and 22,684 prisoners, with 174 guns and 11 standards. After this decisive defeat, all hope of staying the advance of the Prussians with the army of Benedek was at an end; a truce was asked for, but refused; and the victorious Prussians pushed forward towards Vienna, whither Benedek, by a long and circuitous march, had drawn his beaten forces. At the same time, the southern army, which had been employed against the Italians, was collected at the capital, and every precaution was taken, by the erection of entrenchments, fortifications, &c., to insure the safety of Vienna, when, by the agency of the Emperor of the French, a truce was agreed to, which afterwards led to a treaty of peace.

A few days before this campaign had commenced,

the Italians, burning with eagerness to free Venetia from the yoke of the alien, and combining with all the enthusiasm and heroic spirit of a young nation, no small portion of its overweening presumption, had assembled an army of 200,000 men, one half of which, under General Della Marmora, was destined to cross the Mincio between Peschiera and Mantua; while the other half was stationed round Bologna, to operate on the lower Po. To oppose this force, the Archduke Albert, the commander-in-chief in Venetia, had about 90,000 men near Verona, besides the garrisons of the Quadrilateral and Venice, which, of course, were not available for field-service. On June 23 (on which day it was notified to the Archduke that hostilities would be commenced), La Marmora's army crossed the Mincio, unopposed by the Austrians; and the Italian commander, not expecting attack, masked the fortresses of Peschiera and Mantua, and marched the rest of his army forward in a somewhat careless fashion. The Archduke, however, had been all along watching his opponent; and after having succeeded in getting him entangled between the river and the hills, he attacked him (June 24) with his whole force. The Italian left was speedily broken and driven back, and would have been wholly destroyed had not General Finelli, whose division was on the right bank of the Mincio, crossed the river, and held the assailants at bay during the rest of the day. The Austrian attack on the Italian right was, however, at first unsuccessful. In the centre, where were situated the village of Custoza and Monte Belvedere, the keys of the position, an obstinate struggle was maintained on both sides throughout the day, but towards 4 P.M. victory inclined to the Austrians, and soon after they gained possession of the position which decided the day. The Italians fell back, in fair order, towards the Mincio, unpursued by their exhausted opponents, and on the following day, were all again assembled on the right bank of the river. The Italians lost in killed, wounded, and prisoners, 8175 men, and several pieces of artillery; while the loss of the Austrians was about 8000 men. This plan of the campaign having failed, the Italian generals set about devising another, and spent more than a week in deliberation and discussion. At the end of this time, news came of the great defeat which the Austrians had sustained in the north, and of the cession of Venetia, by the Emperor of Austria, to the Emperor Napoleon. Though it was not for a moment in doubt that this cession was only a round-about way of surrendering the province to Italy, the Italian government, true to the Prussian alliance, refused to conclude a separate treaty; and (the Archduke's army having been, as before mentioned, withdrawn for the defence of Vienna) Cialdini's army crossed the Po (July 7), and occupied Padua, Vicenza, and Treviso; while Garibaldi, at the head of his volunteers, and General Medici, with a division of Cialdini's army, advanced up the Lake of Garda into the Trentino, the small body of Austrians in the district being wholly unable to offer a successful resistance to such an overwhelming attack. Not content, however, with attacking Austria by land, a fleet was equipped, and despatched, under Admiral Persano, to assail the Dalmatian coast, and retrieve for Italy by her navy the disgrace which had fallen upon her army; and, accordingly, Persano directed an attack on the island and forts of Lissa, and failed. News of this attack being communicated to Admiral Tegethoff, the commander of the Austrian fleet in the Adriatic, he sailed at once for the relief of Lissa; and though his ships were inferior in number, size, and weight of ordnance, and only 7 of them ironclads, to 12 more powerful vessels of the same sort in the Italian

fleet, he bravely led his ships to the attack, destroyed or sunk two of the largest of the enemy's vessels, broke through his fleet, and took up a position in front of Lissa, ready to renew the fight if necessary. The Italian fleet, however, drew off, and on the following morning, was out of sight, making for Ancona.

Thus baffled both on land and sea, Italy, though vigorously professing her determination to go hand in hand with Prussia, was very loath to agree to the armistice signed by the two belligerent German powers at Nikolsburg, on July 26; and attempted to salve her chagrin by insisting upon the surrender by Austria to her of the Trentino. Prussia, however, having agreed with Italy only for the cession of Venetia, was not inclined to support this demand; and Italy, seeing that she must either make peace or fight for the Trentino, single-handed, against Austria, gave way reluctantly, and agreed to the armistice, August 12.

A third contest was, about the same time, in progress between Prussia and those minor states of Germany which had raised armies to support Austria, viz. Bavaria, Würtemberg, Baden, and Hesse-Darmstadt. After the capture of the Hanoverian army, the Bavarians, who, under Prince Charles of Bavaria, had been advancing slowly to join them, took post, on June 30, at Suhl, in the valley of the Werra. A second army had been assembled under Prince Alexander of Hesse-Darmstadt, and had been drawn together in front of Frankfurt. To prevent the junction of these two armies, the Prussian general, Vogel von Falkenstein, who had 48,000 infantry, 3300 cavalry, and 96 guns, threw a part of his forces forward toward Fulda, and with the remainder attacked the Bavarians, who were inferior in number, and routed them at Dermbach, Kaltenordheim, and Hünfeld, driving them towards Kissingen; he then turned his superior force against Prince Alexander, whom he forced to retreat towards Darmstadt. The two armies were now completely separated, and Von Falkenstein found little difficulty in keeping them apart during the rest of the brief campaign, and in routing the Bavarians at Kissingen and Hammelburg, and the Darmstädters at Aachaffenburg, and driving the broken remnants of the two armies south of the Main. He then crossed the Main, and occupied Würzburg, in Bavaria. After some little delay, peace was concluded between these four minor states and Prussia; but, unlike Austria, of which they were merely the allies, some of them were forced to submit to a certain loss of territory.

The states north of the Main which had taken up arms against Prussia, were completely incorporated—viz., Hanover, Hesse-Cassel, Nassau, Frankfurt, and a small portion of Hesse-Darmstadt, as well as Slesvig-Holstein and Lauenburg; and the other states north of the Main were united with Prussia in a confederacy of a more intimate nature than before existed, called the *North German Confederation*.

Bavaria, Baden, Würtemberg, the part of Hesse-Darmstadt south of the Main, and Liechtenstein were not included in this union, but were invited to reform their armies and enter into a closer mutual relationship, with a view to a military and political connection with the Confederation.

Saxony, which had prominently figured in the contest as an ally of Austria, was doomed by Count Bismark to incorporation; but Austria, supported by France, so steadily opposed this arrangement, that it was abandoned, and the little kingdom was admitted into the Confederation.

Austria, by the treaty of Prague (23d August 1866), was completely excluded from participation

in the new organisation of the German states, and formally agreed to the surrender of Venetia to Italy, to the incorporation of Slesvig-Holstein with Prussia, and to the new arrangements made by Prussia in Germany. A portion of the fifth article of this treaty secured that, if the 'inhabitants of the northern districts of Slesvig declare, by a free vote, their desire to be united to Denmark, they shall be restored accordingly.' Though losing no territory to Prussia, Austria had to pay 40 millions of thalers for the expense of the war, after which payment the Prussian troops were to be withdrawn from the imperial territories.

Saxony resigned to Prussia the right of garrisoning Königstein, and of partially garrisoning Dresden, and paid ten million thalers of war-indemnity; Bavaria (by treaty of Berlin, 22d August) surrendered several districts of Lower Franconia to Prussia, and paid 30 millions of gulden for war-indemnity; Baden (by treaty of Berlin, 17th August) and Würtemberg (by treaty of 13th August) surrendered no territory, but paid, the former six, and the latter eight, millions of gulden; while Hesse-Darmstadt (by treaty of Berlin, 3d September) surrendered various districts of the province of Ober-Hesse, receiving in return several districts formerly belonging to Electoral Hesse, Nassau, and Frankfurt, and paid three millions of gulden for war expenses; also the province of Ober-Hesse, into which were to be incorporated the districts ceded by Prussia, was to form a part of the North German Confederation, the other parts of the grand duchy south of the Main being unconnected with it. Even the little principality of Reuss had to pay 100,000 thalers into the fund for Prussian invalids.

This extensive rearrangement of territory will be more distinctly shewn in the table on the following page, giving a list of states which are members of the new North German Confederation.

The southern German states, as yet independent of the northern confederation—viz., Bavaria, Baden, Würtemberg, Hesse-Darmstadt, and Liechtenstein—have a total area of 43,900 sq. m., and a population (1866) of 3,524,460. The new North German Bund, as now constituted, possesses a common parliament, elected by universal suffrage, in which each state is represented according to its population. The first or constituent parliament, which met early in 1867, was employed in deliberating over the details of the proposed constitution for the Bund, which was drawn up and submitted to it by Count Bismark. After a few weeks' deliberation, the draft, with a few modifications, was agreed upon and submitted to the chambers of the several states for their assent, which, in most cases, was at once given. The new elections then took place, and the first regular North German parliament met in September 1867. The items of the constitution most interesting to non-Germans are, that there is to be a common army and fleet, under the sole command of Prussia; a common diplomatic representation abroad, which must, of necessity, be little else than Prussian; and to the same power are intrusted the management of the posts and telegraphs in the Confederation. The Zollverein (q. v.) has also been remodelled, and a treaty including the southern states as members is all but concluded, a step which paves the way to their entrance into the new confederation. As the southern states are already bound to Prussia, by treaties of alliance offensive and defensive, the king of Prussia, in case of a war, would have at his disposal an armed force calculated at upwards of 1,100,000 men.

The hope of a united Germany, which has long been cherished by ardent patriots, and which, under

GERMANY—GERMERSHEIM.

the old Bund, was mainly deferred by the existence of two powerful rivals, Austria and Prussia, in the German Confederation, is thus in a fair way of being realized.

In the spring of 1867, difficulties arose between Prussia and France respecting the occupation of the fortress of Luxemburg by the former; and as the latter had purchased the province of Luxemburg from the king of Holland, though the formal deed of sale was not drawn up and signed, she maintained that the fortress was part of the province, and that the right which Prussia formerly possessed of garrisoning the city ceased when the province was excluded from the list of German states. A war seemed imminent between the two powers, when, by the good offices of the British government, a congress was assembled in London, at which representatives of the great powers (Italy taking her place among them) were present; and after a few sittings, it was agreed that France should not proceed with her scheme of purchase, that Prussia should evacuate the fortress, and that the province should remain to the king of Holland, and be regarded as a sort of neutral ground, under the combined guarantee of the powers represented at the congress.

Austria (which, curiously enough, though completely beaten by Prussia, lost to that power not an inch of territory, and though decisively victorious over Italy both on land and sea, lost to her vanquished adversary one of her fairest provinces) has been fully employed since the conclusion of peace in conciliating the various nationalities under her sway. By granting to Hungary the constitution for which that kingdom rebelled in 1848, and which involved a separate internal administration, the Emperor Francis-Joseph has succeeded in conciliating the great majority of the high-spirited and independent Hungarians, aided greatly towards the production of this result by the politic counsels of his chief adviser, Baron von Beust (q. v. in SUPPLEMENT), and by the conciliatory bearing of the moderate liberal party in Hungary, which, under the leadership of Deak (q. v. in SUPPLEMENT), has in

its firm stand for Hungarian freedom, not forgotten to give a prominent place to the interests of the Austrian Empire generally. Still, however, the attitude of the non-Hungarian provinces, Transylvania, Croatia, and Slavonia (especially of the latter two), which are now politically united with it, and are represented in the Hungarian diet at Pesth, gives rise to considerable uneasiness; these three provinces having been long jealous of Magyar supremacy, and steadily opposed to any direct union with Hungary.

The weakness of Austria's present position consists in her possessing a large German population in the western provinces, which, imbued, like all other Germans, with the enthusiastic love of 'Fatherland,' may at any moment, by external or internal agency, be impelled to seek reunion with G., and consequent emancipation from allegiance to the Austrian emperor. Italy, though baffled in a military point of view in the contest of 1866, obtained Venetia, the prize for which she strove, and concluded a treaty of peace with Austria.

[The result of the war between France and Germany in 1870-71 was to complete the fusion of the northern and southern states of the latter country, and to raise the king of Prussia to the dignity of Emperor of Germany. One of the terms of peace was the cession of Alsace and part of Lorraine to Germany.]

GERMERSHEIM, a town of the Rhenish Palatinate, or Rhenish Bavaria, on the left bank of the Rhine, at the mouth of the Queich, eight miles south-west-by-south from Spira. The situation is marshy and unhealthy, but it was chosen by the Romans for a station and fortress, which was called Vicus Julius. The Emperor Conrad II. built a castle here. The town was founded beside the castle by the Emperor Rudolph I in 1276, and endowed with all the rights and privileges possessed by Spira. Having passed into the hands of the Electors Palatine, G. was taken by Leopold of

Austria in 1622; and fell into the hands of the French in 1644, by whom it was restored to the Elector Palatine at the peace of Westphalia; but it was again taken by the French under Turenne in 1674, when the walls were demolished, and the towers burned. After the death of the Elector Charles, the French seized the town and the district belonging to it in 1688, as pertaining to Alsace. Hereon followed the *G. War of Succession*, and the country was desolated. The peace of Ryswick restored G. to the Palatinate; and having been fortified, it was assailed in vain by the French in 1715. It was in the midst of the scene of greatest conflict between the French and Austrians during the middle of last century. The Rhine is crossed at G. by a bridge of boats. The town is strongly fortified. It contains a ruinous old castle, in which the Emperor Rudolph of Hapsburg died. There is some trade in corn, hemp, flax, &c., and a fishery of some importance in the Rhine and Queich. Pop. 5322.

GEROME, JEAN-LÉON, one of the most eminent of living French painters, was born at Vesoul, in the dep. Haute-Saône, on the 11th of May 1824. He received his early education in his native town, where his father followed the trade of a goldsmith. In his seventeenth year, he went to Paris, and entered the studio of Paul Delaroche, at the same time attending the course of instruction given at the School of the Fine Arts. He continued till 1844 the pupil of Delaroche, whom, in that year, he accompanied on a tour of considerable length in Italy. It was not till 1847 that one of his pictures was exhibited at the Louvre; since then he has scarcely ever failed to exhibit, and his works soon gained for him the reputation of being one of the most promising artists of the time. A slight indication of the position he had made for himself by 1851 is the fact, that he was commissioned by the minister of state to furnish a design for a vase which was to be manufactured at Sèvres in commemoration of the London Exhibition of that year. In 1853, he travelled for some time in Turkey and upon the eastern waters of the Danube. He has since extended his knowledge of Eastern scenes by a long journey which he made in Egypt and the adjacent countries in 1856, during which he made a valuable collection of sketches, besides accumulating experiences of great value to an artist, and the subject-matter of future pictures. In 1855, he received the Cross of the Legion of Honour; and in 1863, he was appointed Professor of Painting in the School of the Fine Arts, a position which he continues to hold. Many of his pictures have been exhibited in London, and there are few contemporary French painters whose works are so well known to the British public, or so high in favour with English critics. Among his countrymen, his reputation is very high, and is still rising.

From the commencement of his artistic career, G. painted pictures which shewed him an admirable colourist and a promising designer, but it was not till 1855 that he attempted a really great subject. In that year, his picture, 'Le Siècle d'August et la Naissance de Jésus-Christ' was exhibited; it was much canvassed by the critics, on the whole was received with favour, and ultimately was purchased by the state. It was an allegorical composition, intended to be symbolical of the close of pagan civilisation and the dawn of Christianity—a work to try the greatest powers; and the artist not only aimed at the high mystic flights which had taxed all the might of the Raphaels and Michael Angelos, but attempted to combine with these a representation of the highest views of modern philosophy. To say that, in trying so much he had miscalculated

his strength, is only to say that his powers fell short of the very highest; but the attempt shewed an elevated taste and a noble ambition; the execution, too, was in many respects excellent, and the work greatly raised the author's reputation. Many of his subsequent pictures have had a success in no degree equivocal; several of them are now widely known by engravings. In 1859, he exhibited his noble picture of Roman gladiators in the amphitheatre, with the motto: 'Cæsar, ave, Cæsar Imperator, morituri te salutant,' which raised to the highest pitch his reputation as a colourist and painter of the human figure, while making a profound impression by the success with which the human interest of the scene was rendered. With 'Phryne before her Judges,' exhibited in 1861, he won fresh honours as a colourist and draughtsman. In the same year, he exhibited, among other pictures, his 'Socrates searching for Alcibiades at the House of Aspasia;' 'Deux Augures non jamais pu se regarder sans rire;' and a portrait of Rachel. 'Louis XIV. and Molière,' 'The Prisoner,' and the 'Death of Cæsar' are among the best known of his subsequent works—the last, a finely conceived and nobly painted picture, which, for its architecture, its colour, and the subserviency of details very strikingly rendered to a definite human interest, demands the highest admiration. The 'Death of Cæsar,' the 'Phryne,' the 'Gladiators,' and 'Louis XIV. and Molière,' are among the pictures of G. which have been exhibited in London. G. has painted admirably several Eastern subjects; and of the mural pictures which he has executed for the city of Paris, one, the 'Plague at Marseille,' painted in one of the chapels of the church of St Severin, has received the highest encomium. Though not to be ranked among painters of the first class, as a colourist and figure-painter he probably has no superior among living artists.

GHOSTS, OPTICAL. Many remarkable exhibitions have been introduced in recent years, based on certain simple laws of optics long known to scientific men. The mysterious phantom appearances have led to the designation of *ghosts*; but nothing necessarily either ghostly or ghastly attaches to the exhibition. No new principle has been discovered; it is nothing more than an ingenious application of mechanism to render visible to a body of spectators certain phenomena of reflection and transmission, by varying the intensity of light passing upon or through large plates of glass, and by adjusting the position of the actors with reference to the glass and to the spectators.

Mr Dircks, in a paper read before the British Association at Leeds in 1858, and afterwards embodied in a volume, said that his attention had long been directed to this matter. In 1838, he devised something which, under the name of a 'transparent mirror,' he thought likely to be productive of curious optical effects; but he abandoned the subject for nearly 20 years. In 1856, he happened accidentally to see a solid body so peculiarly placed as to appear to be transparent; and this led him to make a variety of experiments, to combine an object with its shadow or its reflection in such a way as to render their discrimination difficult. He supposed a theatre or room, with spectators placed on an elevated and darkened series of seats; and he shewed how they might see two illuminated figures on a stage, without knowing that one was a reality and the other a reflection. By following out the idea, he saw how an actor might get behind a plate of glass, and seem to communicate with the shadow or 'double' of a second actor—how, in other words, a living or solid figure might be so associated with a mere phantom, that the two could play a sort of drama together, suddenly terminated,

perhaps, by one of them fading away, and vanishing through the wall or furniture of the apartment.

Mr Dircks constructed a small box or model to illustrate the principle; and as it really contains the germ of most of the large subsequent exhibitions, we will describe it. The accompanying diagrams shew the outside view, the vertical section, and the ground-plan. ABCDE is an oblong box enclosed on all sides, higher at one end than at

Fig. 1.—Outside View.

the other; F, G are two doors at the sides of the box; H, I, J are three flapped or hinged openings at the top of the box, H for the eye of the spectator, I to put in the models or figures, and J to admit light; KK is a transparent vertical plate of glass, forming a partition in the box; L, M are two compartments separated by this partition; N is an opaque screen, to shield a portion of the compartment L from the eye of the spectator. Now, with small figures or models, very curious optical effects can be presented in this box. Place two figures, Y and Z, in the two compartments, one in each. An eye at A will see the real figure Z, and the

Fig. 2.—Vertical Section.

reflection Y' of the figure Y, but not Y itself; and both will appear to be in the same compartment. By opening in various degrees the flap J and the side-doors F and G, or by closing any one of the three, and opening the two others, the admission of light may be so regulated as greatly to modify the effects. In order that Y' may appear real, no solid body should be placed immediately before or behind it, or its transparency would at once be detected. If the apparatus were large enough for living performers, Z would not see Y', although he would see Y; but by a little rehearsal, Z and Y' might appear to act together. If, omitting Z, two figures exactly

alike, or two similar globes or cubes, were placed at Y and Y', then Y' would appear to a spectator like a substance and a phantom combined; and

Fig. 3.—Ground-plan.

according to the mode of throwing the light more strongly on the one or the other, the substance might seem to dissolve away into the phantom, or the phantom into the substance. By supposing a small theatre or large room to be used instead of a box, living performers instead of model figures, and ranges of seats instead of an eye-hole, this apparatus would become a phantom exhibition for many spectators at once.

The exhibition of Messrs Dircks and Pepper, patented in 1863, gave celebrity and popularity to the subject, being shewn at the Polytechnic Institution, London. The main purpose, as described in the specification, is, 'to associate on the same stage living persons and phantoms to act together.' There is a stage like that of a theatre; and an under-stage at a level six feet or so lower, between it and the spectators. The stage can be seen by all the persons in the hall or theatre; but the under-stage (though nearer) is so managed, by means of screens, dimness of light, and dark baize lining, that its existence is scarcely even suspected by most of the spectators. There is a large plate of unsilvered glass nearly upright, between the under-stage and the stage, so artfully framed and adjusted as to be invisible, and allowing persons on the stage to be seen almost as clearly as if there were no glass there. An actor, whom we will call the hidden actor, is on the under-stage, entirely below the level of the real stage, and out of sight of the spectators. A strong light is thrown upon his face and figure, and is reflected from the front of the glass towards the spectators, who can thus see the reflected image, but not the hidden actor who produces it. For brevity's sake, we will call this reflected image the *phantom*. In order that the reflected light may come in a proper direction to the spectators, the glass is placed either upright or slightly leaning forward at the top, according to the height at which the seats of the spectators are placed. If the light is very strong on the hidden actor, and rather faint on the glass, the phantom appears with wonderful force and vividness. By means of a trap-door closing over the under-stage, the phantom may be made to disappear instantly; or by varying the intensity of the light, the phantom may seem to dissolve gradually. If the under-stage is too small for this, a small bust or model may take the place of the hidden actor; while, on the other hand, if the under-stage is very large, and all the arrangements planned on a complete scale, there may be a whole group of hidden actors and actresses carrying out the details of some story by being reflected into phantoms all at once, or one or two at a time; they may even dance and sing, making their phantom reflections appear to do the like. In all this, there is no mirror or silvered glass, nor is there any focussing lens. The visible actors on the visible stage may take up such positions

as to be near the phantoms, and combine with them to play a dramatic scene. By having a trap in the under-stage, up which a hidden actor may ascend, or one in the proper stage, up which a visible actor may ascend; by arranging the transparent sheet of glass in such a way that it may be varied in inclination, and either raised or lowered; and by throwing light of various colours on the hidden actors, the ghostly effects may be very strikingly diversified.

Most of the subsequent patents relate to extensions of this method, with certain minor additions. Munro's patent (1863) is concerned chiefly with placing between the lamps and the hidden actor screens and media of various kinds, so as to let light fall on some parts, and leave others in darkness. In this way a phantom may be shewn as if dismembered, head severed from the body, legs and arms separated, &c. By placing a movable mirror or silvered glass near the hidden actor, and shifting this while the action is going on, the phantom may be made to go up and down and across the transparent glass. By the aid of two or more mirrors, the phantom may be magnified or diminished in size. By other arrangements, the visible actor may seem to enter a solid cube, or may seem to give a bottle or a letter to the phantom—effects due, in fact, to the superposition of a reflected image upon an object seen by transmitted light. Maurio's patent (1865), instead of causing a hidden actor to be reflected as a phantom, makes the visible actor himself become a sort of phantom before the eyes of the spectators. The phantom of a hidden object is superposed upon the real form of the actor, by nice adjustment; and then, if the light is dimmed which falls upon the actor, and the light brightened which falls upon the hidden object, the former will appear to fade away into invisibility; or the arrangements may be so managed as to make him seem to go through a solid wall, or to be suspended in the air, or walking, or flying.

Without further describing particular arrangements, we may remark generally, that the most striking effects of these illusions are those which are due to the superposition of two pictures or scenes, one reflected from the glass screen, and the other seen through it. It is easy to see what room there is for the exercise of ingenuity in contriving combinations of effects. The details of dramatic scenes can be enacted by phantoms and real persons combined. Punch and Judy can be made to go through their vagaries and batter each other, one being a real figure, and the other a phantom; and it is not until Punch sinks through the solid floor that the spectator knows which was the phantom.

GIARRE, a town of Sicily, in the province of Catania, 42 miles south-west-by-south from Messina, on the slope of Mount Etna, and not much more than a mile from the sea. It is a rapidly increasing town. Many of its inhabitants are vine-growers and exporters of wine, the surrounding district being famous for its vineyards and the quality of their produce. Pop. (1861) 6028. The shipping port of G. is Riposto, about a mile distant; pop. (1861) 4903. It is a busy place, and many small craft are built. G. has a doubtful claim to be regarded as the ancient *Callipolis*. About five miles above the town, on the slope of Mount Etna, are the remains of the celebrated *Castagno de Cento Cavalli*, supposed to have been the greatest chestnut tree in the world. See CHESTNUT.

GILL, JOHN, D.D., a Baptist minister, of some eminence as a theologian, and especially deserving of remembrance as one of the few English divines who have brought rabbinical learning to bear on the interpretation of Scripture, was born at Kettering,

Northamptonshire, November 23, 1697. His parents were in humble circumstances, but they placed him at the grammar-school at Kettering, from which, however, they were compelled to withdraw him before the completion of his course, on account of the enforcement of a rule requiring all the scholars to attend the parish church. He pursued his studies in private, and by his own unaided efforts, attained considerable proficiency in Latin, Greek, and Hebrew. He afterwards devoted himself much to the study of the rabbinical writers. Having begun to preach at an early age, he became, in 1719, pastor of a Baptist church at Horsleydown in Southwark; from which, in 1757, he removed to a new chapel in Carter-Lane, near London Bridge, and there continued to minister till his death, October 14, 1771. G. was a very voluminous author; many of his works were on controversial subjects, often of mere temporary interest, but he produced also some which are still studied or consulted by divines. His first important work was an *Exposition of the Song of Solomon* (fol. 1728), in which he vindicated the authenticity of that book against Whiston. His *Exposition of the New Testament* appeared in three folio vols. in 1746, 1747, and 1748; and his *Exposition of the Old Testament* subsequently at several dates in six folio vols. The complete work, a commentary on the whole Bible, has been since republished (9 vols. 4to, Lond. 1809—1810). G.'s other principal works are—*A Body of Doctrinal Divinity* (2 vols. 4to, Lond. 1769), and *A Body of Practical Divinity* (1 vol. 4to, Lond. 1770), which were afterwards republished together as one work (3 vols., Lond. 1795). He wrote also, as a controversialist, in defence of the doctrine of the Trinity and of Calvinism. He was a very high Calvinist. As a writer, he is extremely discursive and diffuse, by which the value of works full of thought and learning is much diminished. G. received the degree of D.D. from the Marischal College and University, Aberdeen, in 1748. He sent to Dr Kennicott a collection of quotations of the Old Testament in the Talmud, differing from the ordinarily received text, which Dr Kennicott made use of and acknowledged in his great work.

GILLS, or BRANCHLÆ, are the respiratory organs of those animals which obtain the oxygen necessary for their well-being not directly from the atmosphere, but from the air held in solution in the water in which they live. In animals modified for atmospheric respiration, the air enters the system to meet the blood, a peculiar set of movements, more or less complicated, being appointed for its constant renewal. In aquatic animals, on the other hand (excluding aquatic mammals), a different plan is required, in consequence of the small quantity of air contained in the water; and hence the aërating surface is extended outwardly, so as to yield a larger space than could be obtained in the interior. The blood is being perpetually driven along this surface, which is so constructed as to admit freely of the passage of air; and by the natural movements of the body, or by others of a special nature, a fresh supply of aërated water is constantly afforded. The chief forms of respiratory apparatus in different classes of animals are shewn in the accompanying diagram, borrowed from Dr Carpenter's *Comparative Physiology*. Let AB represent the general exterior surface of the body; then at *a* is shewn the character of a simple *outward* extension of it, forming a foliaceous gill, such as is seen in the lower Crustacea; and in like manner, *b* may represent a simple *internal* prolongation or reflection, such as that which forms the pulmonary sac of the air-breathing gasteropods. A higher form of branchial apparatus is shewn at *c*, the respiratory surface being extended

by the subdivision of the gill into minute folds or filaments, as we see in fishes; and a more elevated form of the pulmonary apparatus is seen at *d*, the membranous surface being extended by subdivision of the internal cavity, as in birds and mammals.

Fig. 1.

Lastly, at *e* is shewn a plan of one of the "pulmonary branchia" of the Arachnida, which forms a kind of transition between the two sets of organs—the extent of surface being given by gill-like plications of the membrane lining the interior of a pulmonic cavity.

We shall notice a few of the different forms of gills that occur in various classes. It is in the Annelida that we find the first distinct organs of this kind. Their blood is transmitted to a series of gill-tufts, which are composed of a delicate membrane prolonged from the extreme surface, and which may assume the form of branching trees or of delicate brushes made up of a bundle of separate filaments. These tufts are supplied freely with blood-vessels; and fresh portions of blood and of water are being constantly brought into contact by the natural movements both of the animal and the surrounding medium, and by the action of the cilia covering the respiratory organs. The tufts are sometimes attached at intervals along the whole length of the body, as in *Arenicola*, in which there are 13 pair (see ANNELIDA); while in other cases they occur about the head only. In the latter case, they are extremely beautiful, having the appearance of a flower endowed with the most brilliant tints. Two animals common in the aquarium, the *Serpula* and the *Terebella*, owe their resplendent beauty to these tufts (see figure under SERPULA). In all of the Crustacea, excepting some of the lowest forms, whose general surface is soft, gills are present. The *Branchiopoda*, belonging to the sessile-eyed Crustacea, or *Edriophthalma*, are so called because their fins or feet present the form of simple plates or flattened vesicles, which float in the surrounding fluid, and expose the blood to the oxygen which the water contains. The branchia may be appended to the thoracic limbs in the form of membranous plates (as in *Amphipoda*), or to the abdominal limbs as subdivided lamellæ (as in *Isopoda*), or the branchial plates may expand into vesicles attached to the thoracic feet (as in *Læmodipoda*). Amongst the Crustacea with eye-stalks, or *Podophthalma*, the respiratory plates, in the order *Stomapoda*, are external, and are appendages of distinct locomotive organs, each plate being divided into a series of small filaments or tubes, so as to resemble a broad feather. Their position is abdominal, as is seen in *Squilla*. Here the gills have begun to assume more of the character they present in fishes, the laminated or leaf-like form being replaced by one in which the surface is greatly extended by minute subdivisions into delicate filaments. In the order *Decapoda*, including the crab and lobster, the respiratory organs are of a more special character, and are lodged in branchial chambers protected by the carapace. A special apparatus is here found for the purpose of securing a constant current

of water over the aërating surface. The gills in these animals are in the form of long, slender, quadrangular pyramids, and consist either of numerous thin plates or minute cylinders arranged perpendicular to the axis of the pyramid. There are 9 such branchial pyramids on each side in the crabs, while in the lobster there are 22. For further details on the respiratory organs of the Crustacea, the reader is referred to Professor Owen's *Lectures on the Comparative Anatomy and Physiology of the Invertebrate Animals*, 2d edit., 1855, pp. 320–322.

In the sub-kingdom Mollusca, we find several modifications of gills. In the *Lamelibranchiata*, or common bivalves, there are, as a general rule, two gills on each side. Here the gills are internal highly vascular folds of the mantle lining the valves, and are strengthened by delicate jointed filaments, which support several rows of vibratile cilia, whose constant motion gives rise to regular respiratory currents. This form of gill may be readily examined in the oyster or common mussel. In the *branchiferous gasteropoda*, the form and position of the gills are very variable. In the *Nudibranchiata* (see Alder and Hancock's splendid monograph on this order as occurring in the British seas), they are disposed, as their name implies, without any protection, over various parts of the body, where they often form beautiful tufts of delicate leaf-like or arborescent appendages, as may be seen in *Doris* (q. v.). One of the arborescent processes forming the gills of *Doris Johnstoni* separated and magnified, is shewn in the accompanying fig. 2. The highest and most numerous subdivision of the branchiferous gasteropoda—the order *Pectinibranchiata*—derives its name from the peculiar comb-like arrangement of its gills, which have a special cavity at the fore part of the back, caused by an arching of the mantle. The gills of *Paludina vivipara* are shewn in fig. 3. Finally, in the highest class of molluscs—the *Cephalopoda*—the gills are the organs

Fig. 2.—Gill-process of *Doris*, magnified.

Fig. 3.

The pectinated branchia alone are seen. The concave surface rests on the intestine.—The entire figure of *Paludina vivipara*, copied from Cuvier, is to be found in Carpenter's *Comparative Physiology*.

used for classification; there being two orders—viz., the *Tetrabranchiata*, with four gills, and the *Dibranchiata*, with two gills. The arrangement of these gills, and their relations to other organs, are seen in the accompanying figure of *Septia* (fig. 4).

GILLS.

In the article FISHES, the gills are of necessity briefly noticed, but all details regarding them have been postponed to this article. The following

Fig. 4.—*Sepia officinalis*.

In the Dibranchiata, of which *Sepia* may be taken as an example, each gill consists of a number of triangular vascular laminae, extending transversely from either side of a fleshy glandular stem, and decreasing in size to the extremity of the gill. Each plate is composed of smaller transverse laminae, which are themselves similarly subdivided; the entire gill presenting the triplennate structure, which affords an extensive though close-packed surface for the subdivision of blood-vessels. The number of plates in a gill varies in different genera; in *Sepia* there are thirty-six pairs. The stem of the gill is not only attached by its base, but by a thin membrane, through most of its length, to the mantle. The above description, and the figure, have been borrowed from Owen's *Lectures on the Comparative Anatomy and Physiology of the Invertebrate Animals*, 2d edition, p. 624. The original figure is due to Mr Spence Bate.

remarks on the gills of fishes are condensed from Professor Owen's *Anatomy of the Vertebrates*, vol. i. pp. 475—488. In the *Cyclostomi*, which, if we except the lancelet, constitute the lowest order of fishes, and include the genera *Myxine* and *Petromyzon*, of which the hag and lamprey are examples, the branchiae or gills are sacciform, with external spiracles, and six or seven in number on each side. Each gill-sac receives its proper artery either from the branchial artery or one of its branches. 'The leading condition of the gills in other fishes may be understood,' says Professor Owen, 'by supposing each compressed sac of a *Myxine* (*m* in figs. 5 and 7) to be split through its plane, and each half to be glued by its outer smooth side to an intermediate septum, which would then support the opposite halves of two distinct sacs, and expose their vascular mucous membrane to view. If the septum be attached by its entire margin, the condition of the

vascular surfaces are produced into pectinated lamelligerous processes, tufts or filaments proceeding from the free arch, the gill of an ordinary osseous fish is formed. Such a gill is the homologue, not of a single gill-sac, but of the contiguous halves of two distinct gill-sacs, in the *Myxines*. Already, in the lampreys, the first stage of this bi-partition may be seen (fig. 6), and the next stage in the sharks and rays; consequently, in these fishes a different artery goes to the anterior branchial surface of each sac or fissure from that which supplies the posterior branchial surface of the same fissure; whilst one branchial artery is appropriated to each supporting septum or arch between the fissures, as it is to the liberated septum or branchial arch in the ordinary osseous fishes.'—*Anatomy of Vertebrates*, vol. i. p. 476.

The lampreys, myxinoids, and plagiostomes (sharks and rays) are termed fishes with 'fixed gills,' because in them each supporting septum of the anterior and posterior branchial mucous surfaces is attached to the pharyngeal and dermal integument by its entire outer margin, and the streams of water flow out by the same number of fissures in the skin (as at *k*, in figs. 5 and 6) as those by which they enter from the pharynx, *f*. In the osseous and in the ganoid fishes there are 'free gills,' the outer border of the supporting branchial arch being unattached to the skin, and playing freely backwards and forwards, with its gill-surfaces, in a common gill-cavity, which has a single outlet, usually in the form of a vertical fissure.

In the myxinoids (as the hag) there are (see fig. 7) six or seven branchial sacs, *m*, on either side, and their outlets are produced into short tubes, which open into a longitudinal canal, *k*, directed backwards, and discharging its contents by an orifice, *h*, near the middle line of the ventral surface; between the two outlets, *h*, *h*, is a third larger one, *i*, which communicates, by a short duct, with the end of the oesophagus, *l*, and admits the water, which passes from that tube by the lateral orifices, *f*, leading into the branchial sacs. These sacs, which are developed from the oesophagus, and which may be regarded as the simplest form of piscine gill, have a highly vascular, but not a ciliated, mucous membrane, which is arranged in radiating primary and secondary folds, so as to increase the surface. In the lampreys, there is a further separation of the respiratory from the digestive tract, for each internal blind duct communicates with a median canal, beneath and distinct from the oesophagus.

In all the higher fishes, the inlets to the branchial interspaces lie on each side of the fauces, and are equal in number with the interspaces; while, except in the plagiostomes, there is only one outlet on each side. These outlets vary extremely in size, being relatively largest in the herring and mackerel families, and smallest in the eels and lophioid fishes (as the Angler, q. v.). The length of time that different fishes can exist out of water depends on the modifications for retaining water in the branchial chambers. As a general rule, the chamber is largest when the outlet is smallest, as in the eels, blennies, and lophioids, and these are the fishes that survive the longest out of water, except in such cases as the Climbing Perch (q. v.) or *Anabas*, in which the branchial apparatus possesses complex labyrinthine appendages.

Fig. 6.—Two Gill-sacs of Lamprey.

gill in the *Plagiostomi* (sharks, dog-fish, rays, skates, &c.) is effected. If the septum be liberated at the outer part of its circumference, and the

The main object of the gills of fishes being to expose the venous blood, in very thin-walled vessels, to streams of water, the branchial arteries rapidly subdivide into capillaries, which constitute a net-work in one layer, supported by an elastic plate, and

Fig. 8.—Diagram of the circulation of the Blood through the Branchial Leaflets.

and returning it, along the inner border of the process, to the branchial vein, c. The number of vascular plates or lamellae attached to each branchial process has been estimated at 135 in the carp, 700 in the eel, 1000 in the cod, 1400 in the salmon, and 1600 in the sturgeon.

From the above imperfect sketch of the beautiful structure of the ordinary type of gill in fishes, we pass on to the consideration of these organs in Amphibia or Batrachia. In the lower or perennibranchiate members of this order, the gills exist permanently, but in the great majority they are mere temporary organs. The subject is briefly noticed in the article BATRACHIA; but one or two additional observations may be made. In the newt (*Triton*), a little animal

Fig. 9.—Head and Branchial Appendages of the Larva of a Newt, magnified.

common in most parts of England, and readily kept in a vessel of fresh water, three pair of external gills are developed, at first as simple filaments, each with a capillary loop, but speedily expanding and giving off looplets. The gill is covered with ciliated

epithelium, which loses the cilia before the absorption of the organ, and this takes place after a few days of larval existence. In the larval frog, the gills, which are on a simpler plan, diminish about the 4th, and disappear on the 7th day. The parts of the branchial framework which supports the deciduous gills never get beyond the cartilaginous stage. They thus readily shrink, and become more internal as the head increases in size. As the gills of the perennibranchiate amphibians, in all essential points, resemble those already described, it is unnecessary to notice them.—The present article must be regarded as supplementary to RESPIRATORY ORGANS AND PROCESS OF, in which the comparative anatomy of the subject was altogether omitted.

GIMIGNANO, SAN, a very ancient town of Central Italy, in the province of Siena, and 27 miles south-south-west of Florence, is situated on the top of a hill 1220 feet above the sea. One of the most curious features of the town is the number, 14, of lofty square towers in so small a space, the largest of which is built on an arch under which passes a street, and was erected in 1298. Of the many churches and monasteries which the town once contained, most are in ruins. The principal of those still standing are the *Collegiata* or *Assunta*, which contains some fine old frescoes by various masters; the chapel of *St Fina*, with frescoes by D. Ghirlandajo; and the church of *St Augustin*, begun in the 13th, but not completed till the end of the 14th c., also containing frescoes. There has been of late years established in the suppressed monastery of San Domenico, a house of correction for convicted females, who are sent here from all parts of the surrounding country. Pop. 2587.

GIOVANNI (SAN) IN FIORE, a town of South Italy, in the province and 24 miles east of the town of Cosenza, is situated at the confluence of the Neto and Arvo, in the Sila Forest. Pop. (1861) 9154.

GIOVANNI (SAN) ROTONDO, a town of South Italy, in the province of Foggia, and 19 miles north-east of the town of that name, near Mount Gargana. There are manufactures of linen and woollen fabrics. Pop. (1861) 6786.

GI'TSCHIN, or GICZIN, a town of Bohemia, the capital of a district or circle, stands on the Cydlina, 48 miles north-east of Prague. It consists of the town proper and four suburbs, and had a population in 1857 of 5715. There are important corn-markets. The former Jesuits' college is now used as barracks; but there are a gymnasium and other schools. G. was once the capital of the duchy of Friedland. When Wallenstein chose it in 1627 for his residence, it was merely a collection of some 200 miserable hovels; his activity and munificence soon converted it into an elegant and prosperous city, in which he built (1630) a splendid palace. His body, in 1639, was laid in the neighbouring Carthusian monastery of Walditz; three years after the Swedish general Baner sent the head and right hand to Sweden; the remains lay neglected for a century, until they were removed by Count von Waldstein to Mtnchengrätz.

GIUGLIANO, a market-town of South Italy, eight miles north-west of Naples. It contains four churches, a castle, and a hospital. Pop. (1861) 10,542.

GLADBACH, or BERGISCH-GLADBACH, a town of Rhenish Prussia, in the former duchy of Berg, and in the government of Cologne, eight miles north-east from Cologne. It is a place of considerable industrial activity, and has manufactures of nets, paper, and percussion caps. Pop. (1864) 5648.

GLADBACH, or MÖNCHEN-GLADBACH, a

town of Rhenish Prussia, in the government of Düsseldorf, 14 miles west from Düsseldorf, pleasantly situated on a rising ground near the left bank of the Niers. It is a principal seat of the manufacturing industry of Rhenish Prussia, and has increased very rapidly within the last twenty-five years. Besides being a station on the railway between Aix-la-Chapelle and Westphalia, it is connected by another line with Düsseldorf. Among the branches of manufacture carried on, are the weaving of linen and cotton, druggets and velvets. There are also extensive dye-works and bleachfields. Much flax is grown in the neighbourhood. G. is a very ancient town, having existed at least as early as the days of Charlemagne. It formerly contained a famous Benedictine abbey, founded by Archbishop Gers of Cologne, in 972. Pop. (1864) 18,675.

GLADE-NET, a kind of net used for the capture of birds in the glades of forests. It is much used both in England and in some parts of the continent of Europe for the capture of woodcocks. It is made of a breadth suitable to the glade in which it is to be suspended, through which the birds are known to be accustomed to pass; and is made of fine thread-netting, edged with cords, having weights attached to it below, so that when the rope by which it is held up is let go, it falls at once to the ground; a rope from the upper part of it passing over a pulley in a tree, and being held by the hand of the fowler. When the net is ready, the neighbouring parts of the wood are beaten, to disturb the woodcocks; and when they approach it, it is let down, or drawn up, as may be necessary. In England, the use of the glade-net is common chiefly among poachers and gamekeepers, who, without the knowledge of their employers, but tempted by the high price of woodcocks, resort to this method of obtaining money. Other birds and sometimes hares are also caught in the glade-net. In Siberia, the glade-net is employed for the capture of wild-fowl, and glades are opened, in order to its use, between one lake and another, or between a lake and a river near together.

GLADOVA, a town of European Turkey, province of Servia, on the Danube, immediately below the 'Iron Gate' or rapids of that river, 110 miles east of Belgrade. The place is of little importance, except as being the chief quarters of the Danube Steam Navigation Company, its inhabitants conveying merchandise by land betwixt it and Orsova, about 13 miles further up the river. About 2½ miles below it are the remains of the bridge built by Trajan across the Danube.

GLANDFORD BRIGG, or **BRIGG**, a market-town of England, in the Parts of Lindsay, in the county of Lincoln, and 22 miles north-north-east of the city of Lincoln, on the navigable river Ancholme, which falls into the Humber about 10 miles from Glandford Brigg. It is a station on the Sheffield and Lincolnshire branch of the Great Northern Railway. The town is clean and regularly built, has a handsome modern church with a lofty spire, several other places of worship, a corn exchange, schools, &c. Its free grammar-school was founded in 1669. A considerable trade is carried on by means of the Ancholme, in corn, coal, and timber. The town relies mainly for its prosperity on the corn-market, which is one of the best in the county. The corn exchange is a large building, admirably adapted for the purpose for which it was erected. Formerly, a large business was done in the dressing of hare and rabbit skins for the use of hat manufacturers, but there is now (1867) only one establishment of the kind remaining. Pop. (1861) 3128.

GLASS SNAKE (*Ophisaurus*), a genus of reptiles, belonging to the group *Sauropsidia* of Gray, ranked by some naturalists among serpents, and by others among saurians. There is only one known species, a common native of the United States. It is serpent-like in form, and entirely destitute of limbs. The head is like that of a lizard. The eye has a movable lid, as in lizards. The length is sometimes three feet and a half. The body and tail are marked with transverse lines of black, green, and yellow, each scale exhibiting these three colours. The mouth is small, and the animal feeds on insects, molluscs, &c. It frequents dry places, and can neither climb nor swim. It is remarkable for the readiness with which the joints of the tail break off upon any irritation, so that it is very difficult to secure a perfect specimen. The joints thrown off are soon reproduced. The caudal muscles do not pass from one joint to another, so that the breaking of the tail involves no rupture of muscular fibres, but only a separation of one muscular plate from another.

GLOSSOP, a town of Derbyshire, England, 19 miles west-north-west from Sheffield, on a small river which falls into the Etherow, a branch of the Mersey. A branch railway, about a mile in length, connects it with the main line of the Manchester, Sheffield, and Lincolnshire Railway. It is situated in the midst of the beautiful scenery of the Peak, on a rising ground, above a deep valley, the Dinting Vale, over which the railway is carried by a viaduct of 16 arches. The suburb of Howard's Town exceeds the older town of G. in magnitude. G. is the chief seat of the cotton manufacture in Derbyshire. There are also woollen and paper mills, dye-works, print-fields, bleach-fields, and iron-foundries. The parish church of All-Saints' is an ancient edifice, recently enlarged and improved. Pop. (1861) 19,123.

GMELI'NA, a genus of trees of the natural order *Verbenacea*, having a small 4-5-toothed calyx, and a large, obliquely bell-shaped corolla. *G. arborea*, called **GOOMBAR**, or **KOOMBAR**, in India, is the most valuable for its timber. The tree attains a great size, and is widely diffused, both in Hindustan and the Eastern Peninsula. It has heart-shaped leaves and pannicled flowers. The wood resembles teak, but is closer in grain, and lighter. It bears exposure to water better than most kinds of timber. It is used for many purposes, as for foundations of buildings, decks of boats, Venetian blinds, picture-frames, &c.

GMUNDEN, a town of the Austrian Empire, in Upper Austria, 32 miles south-west from Linz. It is situated at the lower extremity of the Traunsee or Gmundensee, the Lake of Traun or Gmunden, where the river Traun issues from it, in the midst of scenery at once extremely grand and beautiful, and where a region of mountains, precipices, and gloomy pine-forests passes into one of gentle hills and rich cultivation. G. is a well-built town. It is connected by a branch-railway with the railway between Linz and Salzburg. The salt-mines of the vicinity give occupation to many of the inhabitants, and the town is a chief station of the salt-trade. Steam-boats ply upon the lake. Pop. (1857) 5623.

GOHANUH, a town of British India, in the district of Rohtuk, in the North-west Provinces, 45 miles north-west of Delhi. It is situated on the Rohtuk branch of the Delhi Canal, and near the northern extremity of a great depression of the soil, extending about 50 miles southwards. Pop. 6668.

GOLD—EXTRACTION BY SODIUM AMALGAM. Certain difficulties which attend the separation of gold by amalgamation—caused by the presence of other metals which, from their easy oxidation, cover

the gold with a film of tarnish, and prevent the complete action of the mercury on the gold—have led to the employment of sodium amalgamated with mercury in various proportions. The compositions have been made the subjects of two patents, one by Dr Wurtz of New York in 1864, the other by Mr Crookes of London in 1865. Three kinds are now prepared in this country by Messrs Johnson, Matthey, & Co. of London, and are sent in considerable quantities to the gold districts, where their use is said to increase the yield of the precious metal by fully one-seventh part. The separate compositions are known in commerce as Patent Amalgams (A, B, C), supplied in barrels of 2 to 5 cwt. each, or smaller quantities in tins or jars. These amalgams are of different metallic compositions, suited to various classes of ores. They are prepared in accordance with the formulae of the patentee, and each contains the same fixed proportion of sodium. The average strength required for use with ordinary ores may be considered to be 10 lbs. of either of them (as the nature of the ore requires) to from 200 to 300 lbs. of mercury. The price is 3s. 6d. per pound.—Concentrated Amalgam (A), five times the strength of the above; prepared in solid bars for shipment when the expense of freight or land-carriage is great. *Proportion for use*—10 lbs. of this amalgam to from 1000 to 1500 lbs. of mercury. The price is 5s. per lb.

GOLDBERG, a town of Prussia, in the province of Silesia, and in the government of Liegnitz, 12 miles west-south-west from Liegnitz, on the Katzbach (q. v.), a branch of the Oder, famous in the history of the war of 1813. The town is situated on a rising ground, on the right bank of the stream. It is partly surrounded by walls, and protected by three forts. There are extensive manufactures of woollen cloths, hosiery, and gloves. Pop. (1864) 6856.

GONORRHOEA, described also as BLENNORRHOAGIA by some writers, is the most common form of venereal disease. It has been known from very remote times; it is generally believed that the sanitary measures inculcated in the 16th chapter of Leviticus have reference to this disorder as occurring amongst the Jews; and it was described by the Greek and Roman physicians. It consists in an inflammation of the mucous membrane of some part of the generative organs, producing a muco-purulent or purulent discharge from the diseased surface. Hence its name of gonorrhoea, which is formed on the erroneous supposition that the discharge consists of the spermatic fluid, is unsuitable, and the attempt to substitute blennorrhagia, which signifies 'a flow of mucous matter,' has been made. Although it is termed a venereal disease, it is totally distinct from Syphilis (q. v.). Although gonorrhoea is, in the great majority of cases, the result of direct contagion from sexual intercourse with a person who is similarly affected, there is no doubt that a very similar urethral discharge may arise from constitutional and other causes irrespective of contagion, as in scrofulous, gouty, or rheumatic subjects. Moreover, it is certain that this disease in the male may proceed from intercourse with a woman in whom no morbid change of the mucous membrane can be detected by the speculum. Ricord, a French physician of great authority in this department of medicine, lays down the proposition, that 'gonorrhoea often arises from intercourse with women who have not had the disease.' Diday, another high authority, maintains 'that from the very fact of a woman having a discharge, no matter what its origin, she is liable to give a discharge to a man.' English surgeons are gradually taking a similar

view, and admit that gonorrhoea may be the product of other causes than a specific poison. The fact of the disease being usually caused by impure intercourse is proof of the presence and action of the poison, but is no evidence of that poison being of a specific character; any poison capable of being generated by simple inflammation being probably sufficient to induce the disease.

Men are so much more liable to contract this disease than women, that we shall confine our remarks to gonorrhoea in the male. The symptoms usually appear in from three to five days after exposure to contagion. The patient feels an itching or tingling sensation at the extremity of the urethral passage, whose orifice has an abnormally florid appearance, and is usually closed by a viscid, colourless secretion. This premonitory stage may last for a day or two, when there is swelling of the parts, and a thick cream-like pus exudes from the urethra. The passage of the urine is accompanied by a smarting or scalding sensation, and takes place with considerable difficulty, in a contracted or twisted stream. At night, a painful condition of the parts, known as chordee, and due to spasm of the muscular fibres of the urethra, is apt to come on. This stage may last, with slight variations, for a space varying from one to three weeks, its length depending on the patient's mode of life, and the number of previous attacks, the first being always the worst, and each succeeding one being gradually milder. The disease having thus reached its height, gradually subsides; the various symptoms abate in severity, and after a period of uncertain length, the discharge either ceases or assumes an almost entirely mucous character. If it ceases, the patient may be regarded as cured; if the mucous discharge continue, it is known as *gleet*; and it is only in this condition that the term blennorrhagia is truly applicable. This gleet often remains, in defiance of all treatment, for months, and its presence often preys very unnecessarily upon the patient's mind, so as to derange his health, and to suggest unnecessary fears regarding the loss of his virile powers. It is from patients of this kind, who cannot be persuaded that the discharge is unaccompanied by any further mischief to themselves (further than possible annoyance arising from the fact that they should not marry so long as any discharge exists), and that it is sure in due time to cease, unless there is stricture or some other exciting cause, that advertising quacks draw their greatest profits.

There are considerable discrepancies of opinion amongst the highest medical authorities regarding the treatment of this disease. Various quack medicines, in the form of prophylactic washes, to be employed after exposure to possible contagion, are daily advertised in certain cheap and disreputable journals; but as Dr Druitt somewhat quaintly but very truly remarks: 'The only prophylactic to be relied on is chastity; next to this, soap and water, followed by an alum wash.' To these directions he might have added, that the urine should be discharged as soon as possible afterwards, so as to wash out the urethral passage. If the patient apply for advice on the first suspicion of the disease, before any acute inflammatory symptoms have set in, and if he can devote his whole time to his cure, he should keep a constantly recumbent position, should live on a farinaceous diet, avoiding meat, wine, and beer, and the abortive treatment should be tried. This consists in the injection into the urethra, every four or six hours, by means of a glass syringe, of a solution of two grains of nitrate of silver in eight ounces of distilled water. By about the second day, the discharge will begin to lessen, and the use of the injection must be stopped; and if any tinge of

blood has appeared in the discharge, the remedy must *at once* be discontinued. If the diminution extend in a few days to a total disappearance of the discharge, the patient is cured; if a slight discharge continue, a weak solution of sulphate of zinc (one grain to the ounce) may be injected two or three times daily for a few days. During this treatment, the bowels should be kept freely open by an antimonial saline mixture, and the patient should drink freely of barley-water, linseed-tea, and similar mucilaginous fluids. If this treatment be adopted at the very first, we can usually cut short, in a week, an affection that might possibly be troublesome for months; if it be tried after inflammation is fairly established, it is very apt to give rise to *stricture*. If a patient does not seek advice till the acute stage has set in, perfect rest in the recumbent position should be insisted on; but if, as is too often the case, the patient is unable to carry out this important regulation, all exercise must be avoided as far as possible, and the parts affected should be properly supported by a bandage, specially sold for that purpose, and termed a suspensory bandage. A very low, unstimulating diet must be insisted on, and all stimulating drinks strictly prohibited, while he should partake freely of mucilaginous diluents; and as a medicine, an alkaline saline diuretic should be prescribed, such as a combination of a scruple of acetate or bicarbonate of potash, half a drachm of tincture of henbane, and twenty minims of nitrous ether, with a little tartar emetic in urgent cases, administered in a small tumbler of water, containing a little gum in solution, or of barley-water, three times a day. As an outward local application, nothing is better or more soothing than water as hot as the patient can bear it. When, under these means, the scalding pain in micturition and the local swelling subside—but not till then—certain medicines which exert a special influence on inflamed mucous membranes—viz., *copaiva* and *cubebs*—should be administered. *Copaiva* may be administered in half-drachm doses three or four times daily; and after a few days, the dose may be increased, if necessary, to double that amount. Under no conditions can it be made an agreeable medicine. Some practitioners combine it into an emulsion with yolk of egg, liquor potassæ, or gum-arabic; others recommend that it should be taken floating on a wine-glassful of water to which a little tincture of orange-peel has been added. If the gelatine capsules of *copaiva* can be depended on as being genuine, they afford an easy mode of taking this medicine. In whatever form it is taken, it is liable to produce an eruption of the skin, consisting of small red patches somewhat resembling nettle-rash. Although the rash is perfectly harmless, and speedily disappears on the discontinuance of the medicine, and the administration of one or two saline purgatives, it often causes great alarm to a patient who has not been duly warned of its possible occurrence. *Cubebs* is a less unpleasant medicine than *copaiva*. To be of service, at least a drachm of the powder should be taken three times a day suspended in milk. A confection formed by mixing powdered *cubebs* with balsam of *copaiva*, which may be swallowed as a bolus with an envelope of moistened rice-paper, is an efficacious form of prescribing these medicines. In the third stage, when the urgent symptoms are abating, the patient should continue the use of *copaiva* and *cubebs*, and should begin to use injections, commencing with one composed of a scruple of bismuth and half a grain of acetate of morphia in an ounce of water containing sufficient mucilage to keep the bismuth in suspension, to be used thrice daily. After a few days, it may be replaced by one of sulphate of zinc (one grain to an ounce of water), which may be

increased in strength if necessary. If a gleet remains, it must be treated with tonic medicine, especially tincture of iron, exercise in the open air, sea-bathing, good diet, &c.; and the under-side of the urethra may be painted with tincture of iodine, or in very obstinate cases, treated with a slip of blistering tissue. A well-marked case of gonorrhœa, when left entirely to itself, rarely runs a shorter course than from three to four months. Various forms and complications of gonorrhœa occur, into which it is unnecessary for us to enter in this work.

As has been mentioned in the article *OPHTHALMIA*, the purulent discharge of gonorrhœa, if brought in contact with the conjunctiva, may occasion destructive disease of the eye. There is also a troublesome affection, accompanied by pain, swelling, and tenderness of the joints, with feverishness, which is apt to supervene towards the decline of the discharge, which is known as *gonorrhœal rheumatism*.

From what has been stated regarding the so-called *abortive* treatment, it is obvious that, by applying for medical aid on the earliest suspicion of contagion, the patient may save himself from a long and troublesome disease, which, if neglected or badly treated, may give rise to a serious local affection—namely, stricture of the urethra. As patients with diseases of these organs are apt to entertain remarkable and altogether erroneous views as to their constitutions being irretrievably ruined, and to the possible outbreak of secondary and tertiary symptoms, it is the duty of the practitioner always to impress upon them that, as a general rule, gonorrhœa is merely a local affection, and cannot give rise to any subsequent constitutional symptoms.

GOODSIR, JOHN, Professor of Anatomy in the university of Edinburgh from 1846 to 1867, was born in 1814, at Anstruther, Fifeshire, in which county his father and grandfather had, for many years, practised the profession of medicine with great repute. Very early in life, his studious habits and thoughtful disposition attracted attention, and when little more than a boy, he was sent to the university of St Andrews, where he passed through a four years' course of literary and philosophic study. He was afterwards apprenticed to Mr Naamyth, dentist in Edinburgh, and during his apprenticeship, attended the medical classes both in the university and extra-mural school in that city. He studied anatomy under Dr Knox, and natural history under Professor Jameson, and was the intimate friend of Edward Forbes, George Wilson, Samuel Brown, and other young men, who have since made for themselves names as ardent students of the natural sciences.

The position of his native town on the sea-coast had very early caused his attention to be directed to marine zoology, and along with his younger brother, Harry, who was afterwards lost in the unfortunate Franklin Expedition, he had begun to dissect marine animals, and study their forms and structure, before he commenced his medical studies. His training as a dentist led him to undertake an investigation into the Development and Structure of the Teeth, which he afterwards published in an elaborate memoir, and in which he gave the first consistent account of the various stages through which these important organs pass. This *Essay*, published in 1839, at once caused him to be recognised as an observer of great originality and acuteness. On obtaining his diploma at the College of Surgeons, in Edinburgh, he returned to Anstruther, to assist his father in practice; and though actively engaged for some years in the arduous duties of a country doctor, he yet found time, not only to pursue numerous important pathological investigations, but to continue and extend his studies in anatomy and natural history. He formed at the same time an Anatomical Museum,

characterised by the great beauty of the preparations, which was afterwards acquired by the government for the use of the Queen's College, Cork.

He returned to Edinburgh about 1840; and on the conservatorship of the Museum of the Royal College of Surgeons becoming vacant, he applied for, and obtained, the office. Having now acquired a more extensive field for pathological research, he devoted much attention to the structure and mode of growth of tumours, and other products of disease; and in 1842—1843, delivered courses of lectures on the diseases of bone, cartilage, and of the various changes which take place in inflammation of these and other important organs. The improvements in the construction of the compound microscope, about this period, furnished him with a most valuable instrument for conducting his inquiries into the more recondite structural phenomena, which constitute the fundamental nature of the changes from a healthy to a diseased condition of tissues and organs. At the same time, he also investigated the minute structure of the healthy tissues, more especially with reference to the mode in which they performed their functions. He was one of the first observers who strongly insisted on the general diffusion, throughout the animal textures, of the minute bodies called *nuclei*; and he pointed out their importance in connection with the processes of growth, secretion, and nutrition. His Memoir on Secreting Structures, published in 1842, in the *Transactions of the Royal Society of Edinburgh*, shewed, in a most conclusive manner, the influence exercised by the cells within a gland on the secretion formed in its interior. In the same year, he published a description of a case, in which a very remarkable vegetable organism, now known as the *Sarcina ventriculi* (see *SARCINA*), was periodically discharged in the fluid ejected from the stomach during vomiting. In the following year, he communicated to the Royal Society of Edinburgh an account of the structure of the Human Placenta, which is regarded as a most important contribution to the anatomy of that complex organ. Many of his physiological and pathological essays were afterwards incorporated in a special volume, published in 1845, and the facts which they contain have contributed very materially to establish the important modern pathological doctrine of the origin of morbid products from changes in the pre-existing elements of the tissues of the body.

His studies in comparative anatomy and natural history were not, however, neglected during this period. He was an active member of the Wernerian Society, and, along with his friend, Edward Forbes, communicated both to it and other scientific bodies several papers on the Anatomy of Animals, new to science, which they had discovered. His papers on Pelonaia, Thalassema, and Amphioxus attracted especial attention.

In 1844, he was appointed assistant to Dr Monro, Professor of Anatomy in the university of Edinburgh. His enthusiasm and devotion to anatomical work rapidly gathered around him a large class of students, and on the resignation of Dr Monro in 1846, he was appointed by the town-council to the Chair of Anatomy. His reputation as an anatomical teacher now became materially extended, numerous students were attracted to his class, and for many years the attendance each winter-session amounted to between 300 and 400. His great success as a teacher was due, not so much, perhaps, to any special aptitude for public speaking, but to the earnest and painstaking way in which he brought his subject before his students; to his thorough knowledge of anatomy, not only in its minute details, but in its relations to physiological and pathological processes; and to the influence exercised by his manly and straightforward

character. He devoted much of the time not occupied in the duties of his class to the extension of the Anatomical Museum of the university, and dissected and prepared a large number of specimens to illustrate the modifications, in form and structure, of the organs met with in the dissection of different kinds of animals. His preparations of the echinodermata, mollusca, and cetacea are especially worthy of notice.

He had a keen sense of the beauty and symmetry of organic forms, and his philosophic mind early led him to undertake an investigation into the constitution of the skeleton in the vertebrata, the general results of which he communicated, in 1856, to the British Association for the Advancement of Science. A collected edition of his writings, edited by his brother, the Rev. J. T. Goodair, and his successor in the chair, Professor Turner, is in course of preparation.

His devotion to work, and his unremitting attention to the duties of his chair, at length began to tell on his robust frame; and for some years before his death, signs of failing health were visible. Early in 1867, he was obliged to withdraw from all active work; and he died at South Cottage, Wardie (near Edinburgh), March 6, in that year.

G.'s intellect was eminently comprehensive. He was not a mere technical anatomist, but studied his science in its relations to morphology, teleology, and pathology. In his philosophic grasp of principles, in the extent of his acquirements, and in his devotion to his science, he was a worthy disciple of his great compatriot, John Hunter.

GOODYEAR, CHARLES, American inventor, was born at New Haven, Connecticut, December 29, 1800, the son of an iron-manufacturer, with whom, at the age of 21, he went into business in Philadelphia. Failing in the iron trade, his attention was attracted to the manufacture of india-rubber, and he expended all his means, and reduced his family to utter destitution, in experiments with various mixtures and processes, the most successful of which were with magnesia, lime, and nitric acid, to make it available for waterproof shoes, clothing, &c. His efforts were a series of failures, excepting a partial success in treating the surface of rubber goods with nitric acid, until he bought of one Hayward, a rival experimenter, an invention for mixing india-rubber with sulphur. The great secret of vulcanisation, in which the two substances, submitted to a high temperature, are converted into the elastic, enduring, and heat and cold defying fabrics now in use, was an accidental discovery made while standing by a stove, and idly subjecting a mixture of rubber and sulphur to its heat. This new product he patiently perfected, discovering new uses to which it could be applied, until it required sixty patents to secure his inventions. Some of these rights were secured by other persons in England, and in France they were forfeited by an informality; so that, by these means, and in consequence of expensive lawsuits, he has gathered little from ten years of toil and privations, but the honours awarded to his skill and perseverance in giving to the world a staple now applied in different countries to 500 uses, and employing 60,000 workmen in its manufacture.

GOOLAIR'REE or GOMU'L PASS, an important pass in the north-west of India, across the Suliman range from the Derajat into Cabul. It enters the mountains at their eastern base, in lat. 32° 6' N., and long. 70° E. It holds its course, which is very winding, by broken rugged roads, or rather the watercourses of the Gomul, through the wild and mountainous country of the Muzareea. It is of great importance, being the middle route from

Hindustan to Afghanistan, as the Khyber is the northern, and the Bolan the southern. Immense caravans, consisting principally of Lohani Afghans, every spring traverse it westward from the Indus and the adjacent countries, and returning in the autumn, winter in the Derajat. It is much infested by freebooters of the Vaziri Afghan tribe, and the caravans have often to fight their way with much loss of life and property.

GORICA, a town of the Austrian Empire, in Croatia, 10 miles south-south-east from Agram, in the valley of the Sava. Pop. (1857) 7902.

GOSELLIES, a town of Belgium, in the province of Hainaut, four miles north-by-west from Charleroi, and on the canal from Charleroi to Brussels. It has manufactures of woollen cloth, hats, nails, cutlery, soap, &c.; also bleachfields and tanneries. There are coal-mines in the vicinity. Pop. (1863) 6864.

GOUGH, JOHN B., American temperance lecturer, was born at Sandgate, Kent, England, August 22, 1817; his father, a pensioner of the Peninsular War; and his mother, a village schoolmistress. At the age of 12, he went to America as an apprentice, and worked on a farm in Oneida county, New York. In 1831, he went to New York City, where he found employment in the binding department of the Methodist book establishment; but habits of dissipation lost him this employment, and reduced him to that of giving recitations and singing comic songs at low grog-shops. He was married in 1839; but his drunken habits reduced him to poverty and delirium tremens, and probably caused the death of his wife and child. A benevolent Quaker induced him to take the pledge; and he attended temperance meetings and related his experience with such effect as to influence many others. In 1842, he had a short relapse into drunkenness; but an eloquent confession restored him to favour, and he lectured in various parts of America with great success. In 1853, he was engaged by the London Temperance League to lecture two years in the United Kingdom, where he drew large crowds by his earnest, and by turns amusing and pathetic orations. An Autobiography, giving the details of his experience, and a volume of his Addresses, have had a wide circulation.

GOUNOD, FÉLIX CHARLES, an eminent French operatic composer. He was born in Paris in 1818, studied at the Conservatoire there under Halévy, and also under Lesueur and Pauer. Obtaining the first prize of the Institute in 1839, he was sent to Rome to complete his musical education; and while there, devoted himself chiefly to religious music. On his return to Paris, he was for a time attached to the church of the Missions Etrangères, where his earliest compositions were performed: one of them, a *Messe Solennelle*, was the first work which brought him into general notice. For a time, he contemplated taking orders, and went through part of the preliminary novitiate. His first opera, *Sapho*, was produced in 1851; in 1852, he wrote choruses for Ponsard's drama of *Ulysse*; and in 1854 appeared his opera of *La Nonne Sanglante*. His comic opera, *Le Médecin malgré lui*, produced in 1858, was a great success; it was followed in 1859 by *Faust*, which at once attained a widespread European popularity, and raised its composer to the foremost rank of contemporary musicians. *Philtémon et Baucis* followed in 1860; and in 1862, *La Reine de Saba*, which has since become popular in England under the name of *Irene*. The opera of *Mireille* was produced in Paris in 1861; and the oratorio of *Tobias*, written in 1864, was first performed in London in 1866. In G.'s compositions are to be found deep musical science,

a profusion of new and original combinations, and an almost unequalled command of the resources of the orchestra. There is great dramatic power in his operas, and one of their marked features is the prominence given to declamation over melody.

GRÄFRATH, a town of Rhenish Prussia, in the government of Düsseldorf, and 12 miles east-by-south from Düsseldorf, on the Itter. It has manufactures of cotton goods, silk ribbons, and iron-ware; and has recently much increased in manufacturing industry, wealth, and population. Pop. (1864) 5322.

GRAND-COMBE, LA, a town of France, in the dep. of Gard, 35 miles north-west of Nîmes, with which it is connected by railway. Near it are some very important collieries, which supply the French steam-navy at Toulon. In the town are oil-mills and glassworks. Pop. (1866) 8706.

GRANIER DE CASSAGNAC, BERNARD ADOLPHE, a name well known among Parisian journalists, and not unknown in the Palais de Justice, was born at Aviron-Bergelle (dep. Gers), in 1808. He was educated at the college of Toulouse, and contributed for a short time to the southern press, but soon quitted the provinces for Paris, where Victor Hugo introduced him to the *Journal des Débats*, and *Revue de Paris*. Here his vehement style did not give satisfaction, and he was engaged by M. Girardin to write literary criticisms for *La Presse*. In 1840, he sailed for the Antilles, in hopes of political advancement, ingratiated himself with the planters, although he narrowly escaped being murdered by the blacks, married a Creole lady, Mademoiselle Beauvallon, and returned to Paris as deputy for Guadeloupe. Not being able to arrange a satisfactory engagement with *La Presse*, he founded the *Globe*, ultra-Orleanist, and violent to such a degree that the opposition journals agreed to ignore it (*la conspiration du silence*, as it was called). The *Globe* failed; and in 1845 G. de C. started *L'Epoque*, also violent, and also a failure. It was merged in the *Presse*, not, however, before its editor had been openly accused in the Chamber of Deputies of selling his influence with the government. Shortly before the Revolution, he was employed by M. Guizot to set up a ministerial paper at Rome. In 1848, he returned to France, and after a while reappeared in Paris, as an ardent supporter of the Prince President, and a bitter foe to his old patrons, the House of Orleans. He edited the *Pouvoir* (1850), and wrote for the *Constitutionnel* with an excess of zeal and a pretence of exclusive information which led to an *avertissement*. In 1852, he was elected as the government candidate for Mirande (Gers), for which he has been re-elected in 1857 and 1863. In the Chamber, he spoke in favour of the Army Dotation Bill, advocated direct taxation on all descriptions of funded property, additional protection for the interests of literature, and the formation of a local railway in his department. On the 23d of May 1857, he was made Grand Officer of the Legion of Honour, and at the close of the same year, founded *Le Réveil*, a weekly religious organ, which died the next year. He has since been principal editor of the semi-official *Pays*, and in 1863 was manager of the *Nation*. The attacks on Belgium this year (1867) in the former paper were disavowed in the *Moniteur*. The appearances of G. de C. before the courts of justice have been very numerous. In 1842, he was tried for a duel with M. Lacrosse, of whose father he had written disrespectfully, and whom he lamed for life. In 1845, he prosecuted M. Hilbey for libel in his pamphlet on the *Venality of the Press*. In 1847, he was mixed up in the duel in which his brother-in-law, Beauvallon, killed Dujarrier of *La Presse*, and about

which strange things were said. He was also sued by Delasalle for a debt which he declared he had paid. M. Delasalle gained his cause. In 1855, his publisher proceeded against him for non-delivery of a MS. on the Eastern War. The duel between Paul de C. of the *Pays* and a writer in the *Soleil* (in which G. de C. seconded his son), and the unseemly quarrel between the Cassagnacs and M. Vermoul of the *Courrier Français*, are matters of recent notoriety. His most important works are: *A Voyage to the Antilles* (1844); *The Queen of the Prairies*, a romance (1845); *The Causes of the French Revolution of 1789* (1850); *The History of the Directory*, a reprint from the *Constitutionnel* (1851—1856); *The Fall of Louis Philippe* (1857); *The Girondins and the Massacres of September* (1860), &c. All his writings are remarkable for vigour of style, but the thorough-going partisanship of the author greatly impairs their historical value.

GRANMICHELE, a town of Sicily, in the province of Catania, and 30 miles south-west from Catania, on a mountain ridge, at an elevation of 1768 feet above the sea. Beautiful marbles are produced in the neighbourhood. The town was founded in the end of the 17th c. by the Branciforte family, and peopled with the inhabitants of the neighbouring town of Oochialà, which was destroyed by the earthquake of 1693. Pop. (1861) 9931.

GRANT, FRANCIS, LORD CULLEN, a Scottish judge and political writer, was the son of Archibald Grant of Belinton, a cadet of the family of Grant of Grant, chief of the clan of that name. He was born about the year 1660, was educated first at Aberdeen, and afterwards at Leyden, adopted the profession of the law, and distinguished himself by his loyal zeal for the successive governments of William III., Queen Anne, and George I. He wrote in favour of the Union, on the Observance of the Sabbath, on the Law of Patronage in the Church, essays on Law, Religion, and Education, and Reflections on the Rebellion of 1715. For seventeen years, he filled the position of a judge with great ability and integrity. He died at Edinburgh in 1726.

GRANT, PATRICK, LORD ELCHIES, a Scottish judge, was born in 1690. He collected the Decisions of the Court of Session from 1733 to 1757, and wrote annotations on Lord Stair's Institutes. He was celebrated as an acute and learned lawyer. He died in 1763.—His son, JOHN GRANT, became one of the Barons of Exchequer in Scotland.

GRANT, JAMES, of Cortimony, in Inverness-shire, born in 1743, died in 1835, was author of *Essays on the Origin of Society*, 1785, and *Thoughts on the Origin and Descent of the Gael*, 1814. The latter is a learned and ingenious work, imbued with Celtic feeling and enthusiasm.

GRANT, MRS, of Carron, author of the popular song of *Roy's Wife of Auldvalloch*, was born near Aberlour, in Banffshire, about the year 1745. She was twice married—first to her cousin, Mr Grant of Carron, near Elchies, on the river Spey; and secondly, to Dr Murray, a physician in Bath. She died at Bath about 1814.

GRANT, SIR WILLIAM, an eminent lawyer, was descended from the Grants of Baldornie, and was born at Elchies, in Strathspey, in 1754. He was some time Attorney-general in Canada, then M.P. for Shaftesbury, and subsequently for Banffshire; was sixteen years Master of the Rolls, from which he retired in 1817, and died in 1832. Lord Brougham describes him as the greatest magistrate that ever adorned the English bench; and Charles James Fox declared that he was the only man in the House of Commons whom he had any diffidence in replying

to. This arose from the fact, that Grant was a most logical debater and close reasoner.

GRANT, MRS ANNE, a miscellaneous writer, whose works were among the first to draw public attention to the romantic scenery and peculiar manners of the Scottish Highlands, was born in Glasgow in 1755. She was the daughter of a British officer named M'Vicar, who became barrack-master of Fort-Augustus. She married the Rev. James Grant, chaplain of the fort, and subsequently minister of Laggan. Left a widow in destitute circumstances, Mrs G. published by subscription a volume of *Poems* (1803), which were well received; in 1806, *Letters from the Mountains*—a highly popular work; in 1808, *Memoirs of an American Lady*; in 1811, *Essays on the Superstitions of the Highlanders of Scotland*; &c. In 1825, Mrs G. received from government a pension of £100 a year. She died in 1838.

GRANT, CHARLES, LORD GLENELG, was born in India, at Kidderpore, presidency of Bengal, in 1779. He was of a Highland family, the Grants of Shewglie. His grandfather (who was slain at the battle of Culloden) married one of the Macbeans of Kinchyle; and his father was born in Aldourie House, on the banks of Loch Ness, also the birthplace of Sir James Mackintosh. The father of Lord Glenelg (also Charles Grant) went early to India, became one of the most distinguished directors of the East India Company, represented for many years the county of Inverness in parliament, and was, along with Wilberforce, Thornton, Zachary Macaulay, and others, a leading member of the Clapham sect, described by Sir James Stephen in his *Ecclesiastical Essays*. He died in 1823, aged 77. Charles, his eldest son, was carefully educated, and distinguished himself at Magdalene College, Cambridge, where he took his degree of M.A. in 1804. In 1805, he published a poem on the *Restoration of Learning in the East*, which had carried the university prize awarded by Dr Claudius Buchanan. He was called to the bar in 1807, but never practised. In 1811, he was elected M.P. for the Inverness district of burghs; and afterwards succeeding his father in the county representation, he continued in the House of Commons for a period of 25 years, at the expiry of which he was raised to the peerage by letters-patent bearing date May 8, 1835. G. held for five years the office of a Lord of the Treasury; and in 1819, succeeded to the important appointment of Secretary for Ireland, which he continued to fill for about two years. He was the first Secretary for Ireland that sought to carry out conciliatory measures. He endeavoured to suppress the Orange demonstrations, to secure the impartial administration of justice, and to devise a system of national education adapted for Catholics as well as Protestants. Nearly all that has since been done was proposed by this enlightened statesman, and the future historians of Ireland will point to him as one of the genuine though ill-requited benefactors of that country. From 1823 to 1827, G. was Vice-president of the Board of Trade; from 1830 to 1834, President of the Board of Control; and from November 1834 to February 1839, Secretary of State for the Colonies. After this period, G. withdrew in a great measure from public affairs, but supported the Liberal party by his vote. He died at Cannes, in France, in 1866. Lord Brougham pronounced G. to be 'the purest statesman he had ever known.' He was an eloquent speaker, though partly from diffidence, and partly from indolence, he spoke but seldom. Some of his despatches as Colonial Secretary, on the rights of the natives in the colonies, on repressing idolatry, and abolishing slavery throughout the British

possessions in South Africa, are models of elevated and just thought, and of fine impressive English.

GRANT, SIR ROBERT, governor of Bombay, brother of Lord Glenelg, was born in 1785. In 1801, the brothers took their degree of B.A. together in Cambridge, Charles being third, and Robert fourth wrangler, with the additional distinction of Charles being first, and Robert second medallist. The latter was called to the bar at Lincoln's Inn in 1807, sat for some time in the House of Commons as member for Inverness, and afterwards for Norwich and for Finsbury. In 1834, he was knighted, and appointed governor of Bombay. He died at Dapoorie in 1838. He was author of two treatises on Indian Affairs, and of several hymns and short poetical pieces, greatly admired, which were collected and published by Lord Glenelg in 1839.

GRANT, SIR FRANCIS, fourth son of Francis Grant of Kilgraston in Perthshire, was born in Edinburgh, 1803. He received his education at Harrow and at the university of Edinburgh, and was, it is said, originally intended for the Scottish bar, but soon abandoned all thoughts of legal honours, to follow his natural genius for painting. He studied drawing under Somerville, a local artist of some repute, and was enabled, by the kindness of Lord Elgin, to form his taste in that nobleman's gallery. A noble portrait by Velasquez is said to have exercised an especial influence over the young painter's future art-career. His first picture was exhibited in 1834, when he at once took rank among the best portrait-painters of the day, and was regarded as a worthy successor of the courtly Lawrence. His most famous works are those in which he has combined the likenesses of distinguished characters with scenes of English sport. The 'Meet of H.M. Stag-hounds,' painted in 1837 for Lord Chesterfield, and containing no less than 46 portraits; the 'Melton Hunt,' executed for the Duke of Wellington; and the 'Cottesmore,' for Sir R. Sutton, are the best known in this class. Among his other paintings, may be mentioned the equestrian portraits of the Queen and Prince Consort for Christ's Hospital; the picture of the beautiful Marchioness of Waterford; and those of Lords Palmerston, Russell, Gough, Macaulay, Hardinge, &c. In 1842, Mr G. was elected Associate, and in 1851, Academician. In 1855, he received one of the three gold medals awarded to British artists at the Paris Exhibition (for his 'Meet of H.M. Stag-hounds'), and was also elected Member of the Belgian Academy. In 1866, the President's chair in the Royal Academy having become vacant, through the death of Sir C. Eastlake, and neither Sir E. Landseer nor Maclise being desirous of the post, Mr G. was elected in February by 23 votes out of 29, and soon after received, according to ancient precedent, the honour of knighthood. Sir Francis has been twice married. His first wife was a Miss Farquharson of Invercauld; his second, Isabella, daughter of Mr and Lady Elizabeth Norman, and niece to the Duke of Rutland, by whom he has a numerous family.

GRANT, ULYSSES S., Lieutenant-general of the army of the United States, was born at Point Pleasant, Clermont county, Ohio, April 27, 1822; graduated at the military academy of West Point in 1843, and served under General Taylor in the war with Mexico, 1846, up to the capture of Monterey. His regiment was then transferred to the expedition under General Scott, and he took part in every action from Vera Cruz to Mexico, and was brevetted first-lieutenant and captain for meritorious conduct at Molino del Rey and Chapultepac. In 1852, he served in Oregon; but in 1863, having little taste

for the routine duties of a peace establishment, he resigned his commission, and settled at St Louis, Missouri, whence, in 1859, he moved to Galena, Illinois, and engaged in commercial pursuits. At the beginning of the War of Secession in 1861, he volunteered his services, and was appointed colonel of an Illinois regiment. In August, he was appointed brigadier-general, commanding the important post of Cairo, occupied Paducah, and led an expedition on the Mississippi. In February 1862, he distinguished himself in the capture of Fort Donaldson, on the Tennessee River, and was made major-general. April 6, at Pittsburg Landing, or Shiloh, the Federals were attacked by Generals Johnstone and Beauregard, and driven to the shelter of their gunboats; but on the following day, being reinforced, they drove the Confederates to their entrenchments, with heavy loss, including that of General Johnstone; General G., with six regiments, leading the charge which won the battle. Succeeding General Halleck in the West, he commanded the land-forces which, in conjunction with the navy, reduced Vicksburg, July 4, 1863, soon followed by the fall of Fort Hudson, and the opening of the Mississippi. He then took command of the army of Tennessee, which had suffered a disastrous defeat under General Rosencranz, and defeated General Bragg at Chickamauga; and was, in 1864, appointed Lieutenant-general and Commander-in-chief, and personally directed the operations of the great final struggle in Virginia, in which the northern forces, though often repulsed with heavy losses, finally compelled the evacuation of Richmond, April 2, 1865, followed on the 9th by the surrender of the Confederate army under General Lee, and soon after of the entire Confederate forces. General G. issued a congratulatory address to the armies of the United States, June 2, 1865, and has since held the post of commander-in-chief, and been considered the probably successful candidate for the presidency. Simple, reticent, earnest, and persevering in his character, he owed his military success not so much to strategy as to superior numbers and resources and hard fighting, in which even a series of victories left his enemy less able to resist. Congress, in recognition of his eminent services and success, placed in his hands the military government of the conquered South; and in September 1867, on the suspension of Mr Stanton, secretary of war, General G. received, and to the astonishment of many, accepted the appointment of Secretary of War *ad interim* from President Johnson.

GRAPE-HYACINTH (*Muscari*), a genus of bulbous-rooted plants, of the natural order *Liliaceae*, nearly allied to the hyacinths, but differing in the globose or subcylindrical perianth, contracted at the mouth, and 6-toothed. The species are natives chiefly of the countries near the Mediterranean, and the warmer temperate parts of Asia. Some of them are frequent in our flower-borders. *M. moschatum* has a smell of musk. *M. racemosum* is a somewhat doubtful native of the south of England. The flowers of the grape-hyacinths are mostly blue.

GRAPHIS (Gr. *grapho*, to write), a genus of lichens, which gives its name to a tribe, *Graphideae*, remarkable for the resemblance which the fructification (*apothecia*, or *shields*) assumes to the forms of the letters of oriental alphabets. Hence, some of these little plants have received such names as *Scripture-wort*. A peculiar importance has recently been acquired by some of the *Graphideae*, from their being found only on the bark of particular species of *Cinchona*, so that they guide to the ready identification of some of the most valuable commercial barks.

GRA'PHOTYPE is one among numerous modes invented within the last few years of producing an engraved surface from which printing can be effected by the ordinary press. Line-engraving, mezzotinto engraving, aquatint, and etching present the design or picture in *intaglio* on a metal plate, the lines being cut, and therefore below the surface of the plate; they cannot be printed by ordinary typography, because the ink-roller inks the parts that ought to be left clean, and leaves the lines of the device untouched. Wood-engravings, and stereotypes and electrotypes taken from them, can be printed side by side with type in the same page, and by the same operation; and hence the vast extension of this mode of illustrating books and newspapers. The inventors of *graphotype* are trying to introduce a cheap substitute for engraved wood-blocks. Mr De Witt Clinton Hitchcock, a draughtsman and wood-engraver, having occasion for a little enamel white powder, scraped some from the surface of a visiting-card, and then observed that the ink-lines remained just as distinct and prominent as before, not having been removed by the scraping. This slight incident suggested the new process—sketching the design on a chalky surface, and brushing away the chalk from between the lines. Mr Hitchcock's first experiments were partially successful, and he then received aid from others in establishing a *modus operandi*. In the latest form of the process, after many intermediate experiments, the block is superseded by a zinc plate covered with finely-pounded French chalk, brought to a hard and very fine texture by enormous pressure, with a glossy surface produced by an interposed steel plate. On this white surface, sized and dried, the picture is drawn with camel or sable hair pencils, dipped in an ink made of glue and lampblack. When dry, the white or uninked portions are rubbed down by means of a small fitch-hair brush, and pads covered with silk velvet. The rubbing is continued until the white is sunk sufficiently below the level of the inked picture or design. The plate is then saturated with liquid glass or silicate of soda, which converts the French chalk into a kind of marble. The success with which all the white is rubbed down between the inked lines, depends on a variety of circumstances—the hardness of the white, the evenness of the surface, the completeness of the petrifying action by the silicate, the protecting power of the ink or varnish, the quality of the brushes and rubbing-pads, and the careful management of the rubbing itself. Whether the fine lines of the device can be preserved from breaking up into saw-like irregularities, and whether the numerous requirements and qualities of a wood-engraving can be successfully realised, a long course of trial can alone shew. The matter has been taken up by a company.

GRA'PPLE-PLANT (*Uncaria procumbens*), a procumbent plant of the same genus with the Gambir (q. v.), a native of South Africa. The seed-vessel has many hooked thorns, and clings most tenaciously to any animal—a provision for the distribution of the seed. When it lays hold of the mouth of an ox, Livingstone says, the animal stands and roars with pain and a sense of helplessness.

GRA'SS-MOTH (*Crambus*), a genus of small moths, allied to the Clothes-moths, of which the species are numerous, inhabiting pastures, where they are often seen to rise in great numbers when disturbed, and soon to settle again on the blades of grass. Their form, when their wings are closed, is long and narrow, pointed at the head, abruptly cut off at the opposite end. They are often brown and white, sometimes silvery and golden.

GRAY, JOHN EDWARD, naturalist, born at Walsall in the year 1800, was educated for the medical profession. In 1821, he published in the name of his father (who was author of *Supplement to the Pharmacopœia*, and other works) his *Natural Arrangement of British Plants*, in which, for the first time in the English language, the new method was adopted. In 1824, he entered the British Museum as assistant in the Natural History Department, where he found scope for the employment of his extensive knowledge and accuracy of observation, and was subsequently appointed Keeper of the Zoological Collections. This important post he still retains, to the manifest advantage of zoological science, for the British Museum collections are the most complete in the world: a monument of his persevering activity through more than forty years. His success is partly due to his quickness in seizing the peculiar characteristics of animal forms, which renders him a good classifier. For this great work, the Royal Bavarian Academy of Sciences at Munich conferred on him the title of Ph.D. Dr G. has also written much on subjects connected with his department. The mere titles of his books and papers make a long list, numbering nearly 500. His zoological and natural history catalogues are not mere lists, but are enriched with synonyms and ample notes, whereby study of particular subjects is greatly promoted. Dr G. has not confined his activity to his special department; he assisted in the formation, and was elected president, of some of the scientific societies of London which are now in prosperous condition; and he is still a Vice-president of the Zoological Society, and takes an active part in the management. He has, moreover, advocated sanitary and house improvements, extension of education, the opening of museums, gardens, and galleries of art and science to the public; and he claims to have anticipated Sir Rowland Hill in his proposal for a low uniform rate of postage. He has at various times given valuable evidence before parliamentary committees, on the management of the British Museum and other subjects; and he served on the juries of the Great Exhibitions of 1851 and 1862.

Dr G.'s principal works are: *Illustrations of Indian Zoology*, 2 vols. folio; *The Knowsley Menagerie*, 2 vols. folio; *Spicilegium Zoologicum—on Mammalia, Birds, Reptiles, Fishes, Mollusca, Shells; a Synopsis of the Contents of the British Museum*; besides Catalogues of the Specimens in the Zoological Department, which have greatly facilitated the study of those collections. He has also written many scientific papers, which have been published in the *Philosophical Transactions*, the *Transactions of the Linnean Society*, the *Encyclopædia Metropolitana*, *Annals of Natural History*, and the *Reports of the British Association*; the whole comprising a mass of facts and principles highly valuable to naturalists.

In 1826, Dr G. married a lady who has rendered him important aid in his studies, and is known as authoress of *Figures of Molluscous Animals, for the Use of Students*, a work in five volumes. In 1832, he was elected a Fellow of the Royal Society, and has since served on the Council. He is a member of some of the principal societies and academies in England and on the continent.—His brother, Mr G. R. GRAY, is known to students of natural history all over the world as author of *The Genera of Birds*.

GREASE. Various kinds of tallow, fat, dripping, and kitchen-stuff receive the general name of grease, as applied to several manufacturing processes; but the name is now more technically given to the lubricating unguent employed for the rolling-stock of railway companies. While oil is the lubricator for the delicate parts of the locomotive, grease

GREASE—GREAT EASTERN.

is necessary for the axles of the wheels. So vast is the quantity used, that the annual demand amounts to thousands of tons; and, as the quality is very important, most of the great companies make their own—establishing a marked distinction between the two kinds used for locomotives and for wagons.

Locomotive grease usually consists of tallow, oil, carbonate of soda, and water. Much depends on the consistency. If the grease is too thick, the axle-boxes become hot; if too thin, it is used up too quickly. Again, if there is too much alkali, there is a residue left in the boxes; if too little, the grease is too soft and wasteful. The grease is always yellow; but it is made of a thinner consistency for cold weather than for hot. The following are given as the constituents of two kinds that meet with approval, to produce one ton of each kind of grease, allowing a certain percentage for waste:

| | WINTER. | | | SUMMER. | | |
|----------------------|---------|------|------|---------|------|------|
| | cwt. | qrs. | lbs. | cwt. | qrs. | lbs. |
| Tallow, | 3 | 3 | 0 | 4 | 2 | 0 |
| Palm-oil, | 2 | 2 | 0 | 2 | 2 | 0 |
| Sperm-oil, | 0 | 1 | 7 | 0 | 0 | 27 |
| Alkali, | 1 | 0 | 14 | 1 | 0 | 8 |
| Water, | 12 | 3 | 12 | 12 | 0 | 26 |

The manufacture is very simple. The tallow and oils are heated to 180° F.; the water and alkali to 200°; both are run off into wooden tubs, where they are well stirred till cold, with special precautions against the admission of any grit or dirt.

Wagon grease is coarser and cheaper in quality. The ingredients are chiefly some kind of resinous oil and caustic lime. When resin was cheap, wagon grease cost about half the price of locomotive grease, and was useful not only for wagon and carriage axles, but also for low-speed goods and mineral locomotives; but during the American war, the price of resin rose, and then attempts were made to use residues from paraffin, coal-tar, candle-making, cotton-seed oil, fish-oil, pitch-oil, and other substitutes.

It is said that 3000 tons of grease are made every year in the Tyne district, not exactly as a primary product, but as using up a residue from the distillation of resin.

GREAT EASTERN. The mightiest ship in the world has had an eventful history, marked by a much larger share of disaster than of success. In 1852, an 'Eastern Steam Navigation Company' was formed, to maintain an ocean steam-route to the East round the Cape of Good Hope. In 1853, the directors came to a conclusion that, owing to the cost of maintaining coaling-stations on the way, such a route would not pay unless the ship could carry coal enough for the voyage out and home, besides a large number of passengers and a great cargo. Mr Brunel was employed to plan, and Mr Scott Russell to build, a vast steamer that would meet these requirements. The scheme was for a ship that would accommodate 1000 passengers, 6000 tons of merchandise, and 15,000 tons of coal for fuel. Its arrangements (setting aside later alterations) were briefly as follows: Length, 680 feet between perpendiculars, or 692 feet upper deck; breadth, 83 feet, or 118 over paddle-boxes; height of hull, 60 feet, or 70 to top of bulwarks. Bottom flat for 40 feet in width, without keel. Framework of 35 ribs or webs of plate-iron, 3 feet deep, immensely strengthened, and extending from end to end of the ship, at 3 to 5 feet apart; and cross-webs, of similar strength, connecting these at intervals. A double wall or skin of iron plate, outside and inside those ribs, thereby converting the whole hull into a cellular structure, like the top and bottom of the Menai Britannia Tubular Bridge. The plates for this purpose were 10,000 in number, some of them 28 feet

long. The cellular structure was continued along the bottom and about 5 feet up the side, and any one of the cells thus formed could be filled with water. Ten partitions of plate, crosswise of the ship, divided the interior into 11 watertight compartments, further subdivided by longitudinal partitions. The propelling power comprised both paddle and screw. The paddle-engines had 4 boilers, each with 400 brass flue-tubes; there were 4 engines (made by Scott Russell at Millwall), with cylinders of 14 feet stroke, and 74 inches diameter; the paddle-wheels were 56 feet diameter by 13 deep, with 30 spokes or radii. The screw-engines (made by Boulton and Watt at Soho) had 6 boilers; the 4 engines had cylinders, each 4 feet stroke by 84 inches diameter, with piston-rods 7½ inches thick; the propeller-shaft was 160 feet long, and in some parts 24 inches diameter, with a screw propeller at one end 24 feet in diameter. The coal-bunkers, to supply all the furnaces, would contain 14,000 tons; the smoke from the furnaces ascended 5 funnels, 100 feet high by 6 in diameter; each of the 10 boilers, when full of water, weighed 100 tons; the steam was conveyed from the boilers to the engines through a pipe 45 inches diameter. Setting aside the nominal power, all the 8 engines, at full force, were estimated to work up to 11,000 horse-power. There were 6 masts, 5 of them iron, carrying 7000 yards of sail as auxiliary to the steam-power; the masts, yards, gaffs, and large spars were mostly of iron plate, strengthened inside in various ways; the shrouds and standing-rigging were of iron-wire ropes; the anchors, 10 in number, were some of them 10 tons each; the chain-cables were, collectively, a mile long, with links of 50 lbs. each. The vast wall-sided compartments of the ship had facilities for conversion into cabins for 800 saloon passengers, 2000 second-class, 1200 third-class, and 400 officers and crew; or 5000 might have been accommodated in all, if emigrants or troops. The height of the 'tween decks was 13 feet; and all, whether for first, second, or third class passengers, were more lofty than known in any other ship. The full appointments were to comprise 20 small engines, to assist in pumping and working the ship; electric telegraphs, to transmit signals and orders; 20 large boats, decked and undecked; and 2 small steamers (hung on davits abaft the paddle-boxes), each as large as a river-steamer.—Such were the complete plans for the mighty ship; but they were never fully carried out in all their details, owing to numerous alterations and refittings; nevertheless, the description faithfully conveys an idea of the general characteristics of the ship as she now exists. The curvatures of the hull, in length, breadth, and height are shown by diagrams in SHIP-BUILDING.

Thirteen years of the ship's history present a singular series of vicissitudes. During 1854—1857, the operations proceeded at Millwall, under frequent and heavy financial pressure, which taxed the resources of the Company severely; while the engineer and builder were frequently called upon to surmount difficulties of almost unparalleled kind. By November 1857, the ship had advanced to the launching condition. In order to avoid the danger of launching such a long vessel stern foremost, the ship was built with the broadside towards the river, on a timber foundation of immense strength, with sloping ways, or rails, down to the water. Either the ship was too heavy (12,000 tons), or the slope was too gradual; for it required various attempts, between November 3, 1857, and January 31, 1858, and an expenditure of £60,000, to effect the launching. During 1858 and 1859, the works continued as fast as the Company could supply money. Uncertain how far the original intention of a trade to and

from Australia could be realised, the directors determined on a trial trip across the Atlantic. It was a disaster. The ship left the Thames, September 8, 1859; an explosion of steam-pipes took place off Hastings; seven persons were killed, and several wounded; and the voyage abruptly came to an end at Weymouth. Mr Brunel died immediately after his vast ship had made this her first but futile attempt to brave the ocean. After a winter and spring spent in costly repairs, acrimonious recriminations, and suits in law and equity, the ship started again on June 17, 1860. Leaving Southampton on that day, she crossed the Atlantic in eleven days, and reached New York on the 28th. During the remainder of 1860, and the greater part of 1861, she made many voyages to and fro, losing money by the failure of the receipts to meet the current expenses, and constantly required repairs. In December, when political relations with the United States looked ominous, the G. E. served as a troop-ship, carrying the Guards over to Canada with a degree of comfort never before experienced by 2000 human beings in one ship.

The years 1862 to 1864 were nearly a blank as concerns the history of the *Great Eastern*. No attempt was made at a voyage to Australia and back; the trips across the Atlantic had not been remunerative; the government did not often require the services of so vast a fabric as a troop-ship; and the Company were always embarrassed by overhanging debts. To so desperate a condition did matters descend, that the ship was put up for unreserved sale by auction, in February 1864, and brought only £25,000. The purchasers formed themselves into a new Company. Later in the year, negotiations were entered into with the Atlantic Telegraph Company and the Telegraph Construction and Maintenance Company, for the employment of the G. E. as a cable-laying ship. The passenger accommodation was wholly removed from the interior, to make room for the enormous iron tanks in which the cable was stowed. The arrangement and services of the ship in 1865 and 1866, will be found briefly noticed under ATLANTIC TELEGRAPH in SUPPLEMENT. In 1867, when the Paris International Exhibition was approaching completion, a distinct Company, or body of speculators, chartered the G. E. for a certain number of months, to convey visitors from New York to Havre and back again—under the expectation that the number of such visitors would be so vast as to defray the whole of the expenses, and yield a large profit. A great outlay was incurred, to reconvert the vessel from a cable-laying to a passenger ship, and for extensive renewals of machinery. The ship started from Liverpool for New York in May; but the speculation proved an utter failure, there being neither wages for the seamen and engineers, nor profit for the speculators. In December 1867, the ship was quietly lying in the Mersey, waiting for any new career that might offer—the hull as sound as ever. The original name, *Leviathan*, was changed to *Great Eastern*, then to *Great Ship*, and then back again to *Great Eastern*.

GREENBACKS. During the Civil War in America from 1861 to 1865, the immense expenditure of the United States government led to the printing of an unprecedented number of bank-notes, bonds, and currency papers of various kinds. These documents, from the colour presented by them, or some of them, obtained the name of *greenbacks*, a designation which became almost as familiarly used in Congress as among the general public. At first, the manufacture of these notes taxed the resources of the government in a very embarrassing way; and there was ample reason to suspect that forged notes

and bonds were abundantly in circulation; but, by degrees, a fine and large establishment was organised at Washington, under the immediate control of the Secretary to the Treasury. In this establishment, everything was conducted from first to last; rags, fibres, plates of steel, and colours were taken in, and finished notes were sent out. It was only under very rare circumstances that strangers were admitted to view the operations; but one such occasion, in 1864, led to a general description of the place being given in most of the newspapers, from which it was copied into some of the English scientific journals.

Speaking of the establishment as it was in 1864, and not touching upon any of the modifications which may since have been introduced, there were distinct and separate departments for mechanical repairs, paper-making, ink-making, paper-wetting, plate-engraving, printing, numbering and denominating, and cutting. In the paper-mill, all the paper for the greenbacks was made, with a degree of scrupulous attention and uniformity that cannot always be insured in a private establishment. It was necessary to have a paper that would wear well, would not split easily, and would be sufficiently non-photographic to baffle a forger. Dr Gwynn made many experiments, with a view to attain excellence on these points; and at length he produced a kind of paper nearly as strong as parchment and as smooth as satin. The nature of the material was known only to himself and the government. There was a fibre in the paper, quite moulded or felted into its substance, which could not be photographed without discolouring the sheet to which it was transferred, giving it the appearance of a coarse, black, spider-web, which would instantly have betrayed the forgery. In another department, the ink was made by means of grinding-machines, one for each of the several colours used in the various kinds of notes and bonds. While these operations of paper-making and ink-making were in progress, the engraving of the plates was conducted in another department. The steel-plates were engraved with the most minute and intricate devices which the hand and the eye of the artist could execute: it mattered little what device was selected, provided it were difficult for a forger to imitate. One particular note was, in its main features, an engraved copy of a picture in the rotunda of the Capitol at Washington; and the engraving is said to have occupied a whole year to execute. All the devices, of whatever kind, were made to co-operate with delicate water-lines in the paper, to render forgery difficult. As the plates were costly to engrave, and fitted to yield only a certain (though large) number of impressions each, a mode of multiplication was adopted which had for many years been largely used in England. The processes were thus connected: 1. The engraver executed the design on a smooth plate of soft steel. 2. The plate was hardened by well-known processes of heating and cooling. 3. A roller of soft steel was pressed with immense force over the hardened plate, and took upon its surface the device in relief: as the roller was equal in length to the length of the plate, and equal in circumference to its breadth, the curved surface exactly took in the whole of the device. 4. The roller was hardened. 5. The hardened roller was used as a matrix to produce any number of plates in soft steel, which had the device in *intaglio*, like the original plate. 6. These plates, when hardened, were used to print from.

The paper, the ink, and the plates being thus prepared, all was ready for the printing. In the earlier period of the working of the establishment, presses were used such as are generally employed by copper-plate printers; each press attended by a woman to

place and remove the paper, and a man to manage the inking and the pressure; but afterwards, a large room was filled with hydraulic printing-presses, which conducted the operations much more rapidly. The notes, as fast as printed, were interleaved with sheets of thin brown paper, to prevent blurring. In numbering and denominating the notes, a yellow mordant was employed, of such kind that the note could not be photographed without producing a black impression from the yellow portion. The numbering-machine was worked by a treadle; there were six discs with figures on their edges, and they so acted on each other by means of ratchets, that they could print any number from 1 to 999,999. For consecutive numbering, the machine adjusted its own figures after each printing. The notes were usually printed four on a sheet, and were afterwards severed and trimmed by a cutting-machine, which made them all precisely equal in size and shape. So complete was the check established in all the operations, that 'not even a blank sheet,' said a narrator, 'much less a printed one, is passed from one hand to another without being counted and receipted for; and unless there is collusion from one to another in every process through which the paper has to pass before it is finished, there cannot be an over-issue. The paper is issued from one room, and is re-issued from that room sixteen or eighteen times before it is put into circulation; being counted, charged, and receipted for each time, and recounted, recharged, and re-receipted for through each process that it passes after leaving that room.' For the English system, see BANK-NOTES.

GREENSHANK (*Totanus glottis*), a bird of the same genus with the redshank and some of those known as sandpipers, but differing from them in the stronger and slightly recurved bill. It is about the size of a woodcock, but has much longer legs. The bill is about two inches long. The tail

Greenshank (*Totanus glottis*).

is short. The lower part of the tibiae is naked. The plumage is mostly dusky brown on the upper parts, the feathers edged with yellowish white; the under parts are white. Small flocks of this bird are seen on the British coasts in the winter months, and sometimes near inland lakes and marshes. A few remain to breed in the Hebrides and north of Scotland, but the greater number repair to more northern regions. The geographic distribution of the species is extremely wide even for a bird of passage; from the arctic parts of Europe, Asia, and

America, it extends southward as far as Java and Jamaica.

GREWIA, a genus of trees belonging to the natural order *Tiliaceae*, having simple and more or less ovate leaves, and a drupaceous fruit containing four 2-celled and 2-seeded nuts. They are African and Asiatic, mostly tropical and subtropical. Some species, as *G. sapida* and *G. Asiatica*, natives of the warmer parts of India, yield pleasant fruits, much used in the manufacture of sherbet. By the inhabitants of the Himalaya, the inner bark or bast of *G. oppositifolia* is used for the same purposes as that of the lime tree in Europe; and the leaves of *G. didyma* and other species are given as fodder to cattle, and dried and stacked for winter use. The wood of *G. didyma* is used for boats. That of *G. elastica* is much valued for purposes requiring strength and elasticity, as for making bows and the shafts of carriages.

GRIGORIO'POL, a town of South Russia, in the government of Kherson, on the left bank of the Dniester, 78 miles north-west from Odessa. It is a fortified town, and regularly built, is inhabited chiefly by Armenians, and has manufactures of silk and cotton stuffs. Its Armenian inhabitants have received large grants of land in the vicinity, but neglect its cultivation, and are chiefly occupied in commercial pursuits. Pop. (1863) 6545.

GRIVEGNÉE, a town of Belgium, in the province of Liege, and about two miles south-east from Liege, on the right bank of the Ourthe. Steam-engines and other machinery are extensively manufactured; also nails, copper wire, and strings for musical instruments. G. has brickworks, and worsted and fulling mills. There are coal-mines in the vicinity. Pop. (1863) 6124.

GRODEK, or **GRUDEK**, a town of Austrian Galicia, 15 miles west-south-west of Lemberg, with which it is connected by railway, is situated partly on a hill between two small lakes, and partly on three small islands. Pop. 7381, consisting chiefly of German colonists, but including also a number of Jews.

GROSSE'TO, a town of Central Italy, capital of the Maremma (q. v.), on the Ombrone, about 10 miles from its mouth, and 70 miles south of Florence. The town is very unhealthy, but it is well built, and is regularly fortified, the walls forming a pentagon with brick bastions and two gates. It is the seat of a bishop, has a fine cathedral, two convents, hospital, &c., and in the centre of the square a colossal statue of Leopold II. There are manufactures of silk and woollen goods, glass, &c. About 6 miles from G. are the ruins of the very ancient Etruscan city of *Rusella*, the Cyclopean walls of which may still be traced. It was at one time so powerful as to be one of the twelve cities of the Etruscan league. Pop. (1861) 3917.

GROTTÉ, a town of Sicily, in the province, and 13 miles north-north-east, of Girgenti. It derives its name from the number of caves in the rocks around it, which prove it to have been an ancient site. It is supposed by some to be that of *Erbessus*, a town where the Romans deposited their military stores during their siege of Agrigentum, in 262 B.C., but which was seized by Hanno, the Carthaginian general. Sulphur is found largely in the neighbourhood. Pop. (1861) 6468.

GUANONIEN. Under this name, Du Chaillu, in his recent second volume of travels, *A Visit to Ashango Land*, mentions a great bird of prey, inhabiting the tropical parts of Western Africa, hitherto unknown to naturalists, which he thinks may

probably rival in size the condor of South America. He failed, however, in all endeavours to procure a specimen, the bird being apparently very wary. He regards it as an eagle, and not as a vulture, and its habits shew this conjecture to be probable. The traveller says: 'Several times I have been startled in the forest by the sudden cry of anguish of a monkey who had been seized by this "leopard of the air," as the natives often call it, and then saw the bird, with its prey, disappear out of sight.' On one occasion, he saw a nest of this bird at the top of a gigantic tree, but the young had flown away. At the foot of the tree lay more than 100 skulls of monkeys, of different sizes, some of which must have been formidable animals.

GUEBWILLER, a town of France in the dep. of Haut-Rhin, 15 miles south-south-west of Colmar, on the right bank of the Lauch, at the foot of the Ballon de Guebwiller. The town is well built, has two handsome churches, one built in the 11th, and the other in the middle of last century. There are manufactures of tape, ribbons, cottons, woollen cloths, gloves, nails, and refined sugar; there is also an extensive manufacture of spinning-machinery. In the vicinity are coal-mines and slate-quarries; good white wine is abundantly produced in the district. Pop. (1866) 12,218.

GUEUX, or 'The Beggars,' the name assumed by the confederated nobles and other malcontents who opposed the tyrannical policy of Philip II. of Spain in the Low Countries. Philip having sent nine inquisitors to that country to put into execution the decrees of the Council of Trent, provoked by this act the bitter resentment of the Protestants, as well as of the Catholics and nobility, who saw in it an attempt to curtail their ancient liberties. A party of opposition was thus formed, and, headed by Counts Louis of Nassau and Henry de Brederode, declared in an act called the 'Compromise,' which was remitted (5th April 1566) to the Regent Margaret, their fixed determination to ignore utterly the authority of the inquisitors. On the admission of a deputation from them to an audience, the regent seemed somewhat unnerved by their bold front, and inclined to yield to their demands; when one of her council approached her, and whispered that she 'need not be afraid of these gatherings of beggars.' The remark having been overheard by some of the deputation, the abusive epithet was assumed as the title of their association. As a sign of fraternity, each of the 'beggars' wore a medal called the 'beggar's denier,' made of gold or silver, and stamped on the obverse with the image of Philip II., and the inscription, 'In everything faithful to the king;' and on the reverse with a wallet, such as the mendicant monks carried, held in two hands, with the words, 'even to the carrying of the wallet.' The 'beggars' maintained a long and vigorous contest against the despotic proceedings of Philip and his advisers, but were ultimately compelled to succumb to superior force. A branch of them, 'the Beggars of the Sea,' under the bold leadership of the savage Count de la Marok, were almost uniformly successful in their enterprises: they several times defeated the Spanish fleet, captured transports with supplies for Alva's army, captured several fortresses, and succoured besieged places along the coast.

GUICOWAR, or 'the Herdsman,' the designation of a powerful Mahratta prince, whose dominions at the present time include most of Guzerat (q. v.), with Baroda for capital. The G. originally, as the name denotes, was an officer in the establishment of the rajahs of Satara, the supreme rulers of the Mahrattas (q. v.), and after a time rose high in rank

from his military services, being ultimately appointed hereditary second in command of the Mahratta armies, of which the command-in-chief was vested in the family of Sindia. Pelasjee, who became G. in 1721, by predatory excursions gradually acquired authority over Guzerat; and his son Damajee, who succeeded in 1732, still further extended the bounds of this ample dominion. The latter then threw off his allegiance to the Peishwa, but being taken prisoner by treachery, he was compelled to yield one half of his dominions, and do homage for the other half. Annund Rao, who ascended the throne in 1800, was the first prince of the line who had intercourse with the British Indian government; and it is worthy of remark that, down to the present time, the relations of the British with these Mahratta princes have been uninterruptedly friendly. The two powers came into contact on the occasion of a civil war between the reigning prince and an illegitimate brother who aspired to the throne; and in consideration of the aid afforded him by the Bombay government, the G. agreed by treaty to disband his Arab soldiers, and receive a British subsidiary force, 15th March 1802. This was effected, not without some disturbance on the part of the refractory soldiery; and various other agreements having been made from time to time, the whole of them were included in a treaty of general defensive alliance, 21st April 1805, by which a permanent British subsidiary force is maintained by the Guicowar. This prince held himself aloof from the disputes between the British government and the other four great Mahratta chiefs, but in 1816 he became involved in a quarrel with the Peishwa with respect to some districts claimed by each. The Peishwa caused the ambassador of the G., an able and upright minister, to be treacherously assassinated; and refusing the demand of the British Resident (who was bound by the treaty of 1805 to aid the G.), that his infamous agent should be given up, became involved in hostilities with the Calcutta government, which ultimately terminated in the destruction of his state and power. Syajee Rao, who ascended the throne in 1819, abolished suttee in February 1840.

GUI'SBOROUGH, a market-town of the North Riding of Yorkshire, 5 miles from the mouth of the Tees, and 40 miles north of York. It is connected with the Stockton and Darlington branch of the North-eastern Railway. The town lies at the foot of the Cleveland Hills, consists chiefly of one main street of good houses, has several churches, grammar and other schools, almshouses, and market-house. The earliest alum-works in England were established here about the year 1600. There is a trade in wool. Rope-making, brick and tile making, and tanning are carried on. The recent development of the ironstone mining in the neighbourhood has brought a large number of miners and others to reside in and about the town, so that, since 1861, the population has greatly increased. A rich monastery once stood here, of which a small part still remains, built in 1119 by Robert de Brus, lord of the town. At the time of the Reformation, this was one of the wealthiest and most magnificent monastic institutions in the kingdom. Recent excavations have brought to light many interesting antiquities. Among other objects, the workmen came upon the remains of an oak coffin, containing a skeleton, which was found to measure 6 feet 8 inches in length. Pop. (1861) 3794.

GUISE, a town of the department of Aisne, France, situated on the left bank of the Oise, 37 miles north-north-east from Soissons. It is walled, and otherwise fortified. It is an ancient town, and was of much consequence in the early wars of

France. Within the town are the ruins of a castle, from which the famous Dukes of Guise (q. v.) derived their title. G. is now a place of considerable commercial and industrial activity; has linen and cotton manufactures, tanneries, &c., weekly markets, and eight annual fairs. Pop. (1866) 5099.

GULUNCHA (*Cocculus cordifolius*), a plant of the same genus which yields Calumba (q. v.), extensively used in the East Indies as a tonic and febrifuge. It is largely cultivated in some parts. It is a climber, with heart-shaped leaves. It exhibits a wonderful tenacity of life. When it has acquired the diameter of half an inch, it is not unusual to cut from the main stem a portion of from 20 to 30 feet in length, when the part sustained by the branches of the tree sends down threads to the ground, which take root, and become new stems. To plant it, a few yards of the stem are merely made into a coil, and hung on the branch of a tree (Tennent's *Ceylon*).

GUN-COTTON. Since the article on this material was written, great improvements have been effected in its manufacture and application, and in consequence, its use is rapidly extending, especially in Great Britain, where it is found of great advantage in mining operations, owing to its not producing smoke when exploded. For the improvements as well as the invention of gun-cotton, we are chiefly indebted to the Austrians, the most important improvement being that of Baron Lenk, consisting chiefly in the following precautions in the manufacture: 1. A perfect cleansing and drying of the cotton. 2. The use of the most concentrated and purest acids procurable commercially. 3. Steeping the cotton a second time in a mixture of the strong acids. 4. Continuance of this steep for forty-eight hours. 5. A thorough purification of the gun-cotton from free acid by washing in a running stream for several weeks. This may be supplemented by washing in a weak solution of potash, but is not absolutely necessary. The following are the important advantages insured by the new method of making gun-cotton:

For Purposes of Artillery.—1. The same initial velocity of the projectile can be obtained by a charge of gun-cotton one-fourth of the weight of gunpowder. 2. There is no smoke from the explosion of gun-cotton. 3. Gun-cotton does not foul the gun. 4. Gun-cotton does not heat the gun to the injurious degree of gunpowder. 5. Gun-cotton gives the same velocity to the projectile with much smaller recoil of the gun. 6. Gun-cotton will produce the same initial velocity of projectile with a shorter length of barrel. 7. In projectiles of the nature of explosive shells, gun-cotton has the advantage of breaking the shell more equally into much more numerous pieces than gunpowder. 8. When gun-cotton is used in shells instead of gunpowder, a quantity equal in weight to one-third of the latter produces double the explosive force.

For Civil Engineering and Mining.—9. In driving tunnels through hard rock, a charge of gun-cotton of given size exerts double the explosive force of gunpowder, so as to render a smaller number of holes necessary. 10. Gun-cotton also may be so used as, in its explosion, to reduce the rock to much smaller pieces than gunpowder, and so facilitate its removal. 11. As gun-cotton produces no smoke, the work can proceed much more rapidly, and with less injury to the health of the miners. 12. In working coal-mines, the advantages of bringing down much larger quantities of material with a given charge, and the absence of smoke in the explosion, enable a much greater quantity of work to be done in a given time at a given cost. 13. The weight of gun-

cotton required to produce a given effect in mining is only one-sixth part of the weight of gunpowder. 14. In blasting rock under water, the wider range and greater force of a given charge is a great element in cheapening the cost of submarine work. 15. The peculiar local action of gun-cotton, to which the effects of gunpowder shew no analogy, enables the engineer to destroy and remove submarine stones and rocks without the preliminary delay and expense of boring chambers for the charge.

For Military Engineering.—16. The smaller weight of gun-cotton offers great advantages in facility of transport, the weight being one-sixth that of gunpowder. 17. The peculiar localized action of gun-cotton enables the engineer to destroy bridges and palisades, and to remove every kind of obstacles with great facility. 18. For submarine explosion, either in attack or defence, gun-cotton has the advantage of a much wider range of destructive power than gunpowder. 19. For the same purpose, gun-cotton, from its lightness, has the advantage of keeping afloat the water-tight case in which it is contained, while gunpowder sinks it to the bottom.

For Naval Warfare.—20. Where guns are close together, as in the batteries of ships and casemated forts, the absence of smoke removes the great evil of the firing of one gun impeding the aim of the next, and thus gun-cotton facilitates rapid firing. 21. Between-decks also, the absence of smoke allows continuous rapid firing to be maintained. The absence of fouling and of heating are equally advantageous for naval as for military artillery.

General Advantages.—22. Time, damp, and exposure do not alter the qualities of the patent gun-cotton. It has already been preserved ten years without injury or decay. 23. It can be transported through fire without danger, simply by being wetted, and when dried in the open air, it becomes as good as before. In the case of a ship, or a fortress, or a city being on fire, this quality may be of the greatest value. 24. It is much safer than gunpowder, owing to its being manufactured in the shape of rope or yarn. Loose gunpowder escaping from its package, or spilled by accident, is a frequent danger and cause of explosion, from which manufactured gun-cotton is free. 25. The patent gun-cotton has the peculiarity of being entirely free from the danger of spontaneous combustion, and it is constant and unalterable in its nature; for these reasons it secures that degree of safety and certainty which, at the time of the original invention, the gun-cotton of Schönbein did not possess.

GURKFIELD, a town of Carniola, Austrian Empire, on the right bank of the Save, 46 miles east-by-south from Laibach, at the base of a mountain-range. It is supposed to occupy the site of the Roman Noviodunum. The district produces much wine. There are thermal springs and baths in the town. It contains a Capuchin monastery. Pop. (1857) 5065.

GURMUKTESWA'R, a town of British India, in the district of Meerut, on the route from the town of Meerut to Moradabad, and 31 miles south-east of the former. It is situated on the right bank of the Ganges, about 4 miles below the reunion of the Burha Ganga, or old course of the Ganges, with the present main channel, which, a mile and a half above the town, is crossed by a much-frequented ferry, on which 15 boats constantly ply. G. may be regarded as the port of Meerut and the adjoining district of the Doab. Pop. 8781.

GYARMA'T-BALA'SSA, or **BALASSA-GYARMAT**, a town of Hungary, in the county of Neograd, 42 miles north-by-east from Pesth, on the left bank of the Eipel or Ipoly. The surrounding district is

very beautiful and fertile, producing much excellent wheat. Near the town are the ruins of a castle, once belonging to the Balassa family, and famous as having been oftener than once heroically defended against the Turks. Pop. (1857) 6098.

GYOMA, a town of Hungary, in the county of Bekeas, 89 miles south-east-by-east from Pesth, and on the railway between Pesth and Temeswar. It stands in a plain on the bank of the Körös, which is here crossed by a bridge. There is a Protestant church. Pop. (1857) 8575.

GYPSY-WORT (*Lycopus Europæus*), a perennial plant of the natural order *Labiatae*, with stem about two feet high; opposite, ovato-lanceolate, scarcely stalked, almost pinnatifid, wrinkled leaves; and dense whorls of small whitish flowers with purple dots, the limb of the corolla 4-cleft and nearly equal; only two stamens perfect. It grows in ditches and wet places, in Britain and on the continent of Europe. It is a febrifuge. The juice stains cloth a permanent black colour, and gypsies are said to use it to give a dark hue to their skin, whence the English name gypsy-wort, and the French *Herbe des Bohémiens*.

GYROSCOPE (Greek) is the name given to an instrument for the exhibition of various properties of rotation and the composition of rotations. It differs from a top in having both ends of its axis supported. The invention is probably French or German, and in some of its forms it dates from about the end of last century; but no certain information can be obtained on these points. We will consider only two of its many applications.

First, if a mass be set in rotation about its principal axis of inertia of greatest or least moment, it will continue to revolve about it; and, unless extraneous force be applied, the direction of the axis will remain unchanged. Such, for instance, would be the case with the earth, were it not for the disturbances (see NUTATION and PRECESSION) produced by the sun and moon: the direction of the axis would remain fixed in space (i. e., the pole-star would be always the same star), in spite of the earth's motion in its annual orbit. It is for this very reason that modern artillery is rifled, so that the projectile revolves about its axis. If, then, a mass of metal, as, for instance, a circular disc, loaded at the rim, and revolving in its own plane, be made to rotate rapidly about its axis of greatest moment of inertia, and if it be freely supported (in gimbals, like the box of a compass), the direction of its axis will be the same so long as the rotation lasts. It will therefore constantly point to the same star, and may, of course, be employed to shew that the apparent rotation of the stars about the earth is due to a real rotation of the earth itself in the opposite direction. This application was made by Foucault shortly after his celebrated Pendulum (q. v.) experiment, and he is generally looked upon as the inventor. The *Transactions of the Royal Scottish Society of Arts*, however, shew that this application of the gyroscope was made many years before (March 1836), by Mr E. Sang, C.E. It is, in practice, by no means so perfect a mode of proving the earth's rotation as the Foucault pendulum; but this arises solely from unavoidable defects of workmanship and materials—the mass of the gimbals, and the friction on the pivots. Professor Smyth, the Scottish Astronomer-Royal, has recently applied this property of the gyroscope to the improvement of our means of making astronomical observations at sea. A telescope, mounted on the same support as the ends of the axis of the gyroscope, will, of course, be almost unaltered in position by the rolling or pitching of a vessel; and a steady horizon, for

sexant observations of altitude, is procured by attaching a mirror to the support of the gyroscope, and setting it once for all by means of spirit-levels. The mechanical difficulties of construction have not yet been quite got over, but there seems to be little doubt that this application will some day be of very great practical value.

But the most singular phenomena shewn by the gyroscope are those depending on the *composition* of rotations. We have already seen (ROTATION) that any motion whatever of a body which has one point fixed is of the nature of a rotation about an axis passing through that point. Hence, simultaneous rotations about any two or more axes, being a motion of some kind, are equivalent to a rotation about a single axis. The effect, then, of impressing upon the frame in which the axis of the gyroscope is suspended a tendency to rotate about some axis, is to give the whole instrument a rotation about an intermediate axis; and this will coincide more nearly with that of the gyroscope itself, as the rate of its rotation is greater. It is hardly possible to explain to the non-mathematical reader the exact nature of the compound motion, which consists in the rolling of an imaginary cone fixed in the gyroscope upon another fixed in space; but the rotation of the axis of a top round the vertical (when it is not 'sleeping' in an upright position), and the precession of the earth's axis, are precisely similar phenomena. Thus, when the gyroscope is spinning, its axis being horizontal, a weight attached to the framework at one end of the axis (fig. b) makes the whole rotate about the vertical; attached to the other end, the rotation takes place in the opposite direction. And the framework may be lifted by a string attached near

Gyroscope.

one end of the axis (fig. a) without the gyroscope's falling. Its axis still projects horizontally from the string, but it revolves as a whole round the string. Various other singular experiments may be made with this apparatus; and others, even more curious, with the gyrostat of W. Thomson (q. v.), which is simply a gyroscope enclosed in a rigid case, by which the ends of its axis are supported. When a gyrostat is made the bob of a pendulum under certain conditions, the plane of vibration of the pendulum turns, as in Foucault's celebrated experiment, but in general at a much greater rate.

H

HAI'DUCKS (i. e., Drovers, from the Hungarian *Hajdú*, plural *Hajduk*), originally a designation of cattle-herds in Hungary. Afterwards, the word came to signify a class of mercenary foot-soldiers, ready to accept pay from any who would employ their services, but displaying great gallantry in the field of battle. The remarkable constancy with which they stood by Bocskai throughout the war of the revolution, was rewarded by that prince with a grant of a district as their own possession, and at the same time with the privileges of nobility. This grant was made by a public decree of 12th December 1605, and was confirmed by the diet in 1613. Except the privilege of exemption from taxes, which Charles III. took away, the Haiducks enjoy all the rights of nobles to the present day. Their residence, the Haiduck district, remains independent of the county authorities, and is under the direct administration of the national government. The Haiduck district lies within the county of North Bihar, between the Theiss and Transylvania, has an area of about 594 sq. m., and six principal Haiduck towns: Bözörmény, with 17,500 inhabitants; Dorog, with 9100; Hadház, with 5100; Nánás, with 12,440; Szobozsló, with 13,560; and Vámospirca, with 3690: in all, 61,390, chiefly Magyars, of whom 55,900 belong to the Reformed Church, the rest being Roman Catholics, Greek Catholics, and Jews. The capital of the district is Bözörmény. In course of the present century, the name Haiducks has begun to be applied to the maces of Hungarian courts and the halberdiers of the Hungarian magnates; also to the lackeys and other attendants in German courts.

HAI'NICHEN, a town of Saxony, 28 miles west-south-west of Dresden, on a tributary of the Mulde. Wool-spinning, weaving, and the manufacture of cloth are carried on. Pop. (1864) 7053.

HAL, a town of Belgium, in the province of South Brabant, on the Senne and the Charleroi Canal, 10 miles south-east of Brussels. It is a station on the Mons Railway. The church of St Mary is a rich Gothic edifice, containing a chapel resorted to by pilgrims on account of a black miracle-working wooden image of the Virgin, two feet high, which has acquired enormous wealth from the offerings of pious devotees. The high altar has a marble reredos, unequalled in the Netherlands, carved by Mone, a native artist, 1533. The town has breweries, tanneries, distilleries, several mills, and manufactures of wicker-work and articles of wood. Pop. (1863) 7817.

HALE, SARAH JOSEPHA, American authoress, was born at Newport, New Hampshire, 1795; her maiden name was Buell. Married to David Hale, an eminent lawyer, about 1814, she pursued with him a regular course of study until his death in 1822, when she devoted herself to authorship, and produced her earliest work, *The Genius of Oblivion, and other Poems* (Concord, N. H., 1823), followed by *Northwood, a Tale of New England* (Boston, 1827). In 1828, she removed to Boston, and edited the *Ladies' Magazine*, monthly, until 1837, when it was united

with the *Ladies' Book*, Philadelphia, in which city she has since resided. Besides her labours as editor, she has written *Sketches of American Character; Traits of American Life; Flora's Interpreter; Good Housekeeping; Grosvenor, a Tragedy* (founded on the story of Colonel Hayne, a martyr of the Revolution); *The Judge, a Drama of American Life*; three metrical romances (entitled *Alice Ray; Three Hours, or The Vigil of Love; and Harry Grey*); and her most important work, *Woman's Record*, or sketches of all distinguished women from the creation to 1854 (2d edition, New York, 1855). All her works are characterised by good taste, and her tales and poems by vivid description and strong pathos.

HALLÉ, CHARLES, an eminent pianist, was born at Hagen, in Westphalia, in 1819; studied first at Darmstadt, and afterwards at Paris, where his reputation was established by his concerts of classical music. He afterwards settled in England, where his time has been principally divided between London and Manchester. In purity of style, he is considered almost without a rival, and the best living interpreter of Beethoven. His aim has ever been to raise the popular standard of musical taste, an object in which he is believed to have achieved no small success in London, Manchester, and elsewhere.

HALLECK, FITZ-GREENE, an American poet, born at Guilford, Connecticut, in 1795. By his mother, Mary Eliot, he was descended from John Eliot, 'the apostle of the Indians.' He became a clerk in a bank in New York in 1813, in which employment he remained for many years. He was afterwards for a considerable time the confidential agent of Mr John Jacob Astor in his commercial affairs, and was appointed by him one of the original trustees of the Astor Library in New York—a position which he held to the end of his life. In 1849, he retired from banking and mercantile pursuits, and took up his residence in his native place, where he spent the remainder of his days. From his boyhood, H. wrote verses, some of which he sent to newspapers; but in his collected poems, he has included nothing published earlier than his lines on *Twilight*, which appeared in a New York paper in 1818. In the following year, he became associated with Joseph Rodman Drake in contributing the humorous series of *The Croaker Papers* to the same journal. The illness of Drake soon put an end to these papers, and H. commemorated his friend's death in a very beautiful little poem. In 1849, H. wrote his longest poem, *Fanny*, a satire on the literature, fashions, and politics of the time, in the measure of *Don Juan*. It is said to have occupied less than three weeks in its composition, and derived its immediate and great popularity rather from the pungency of its allusions than from any higher merit. In 1822—1823, H. visited Europe; and in 1827, published an edition of his poems, in which were included several pieces suggested by the scenes and associations of the Old World, among which the lines on Alnwick Castle and on Burns particularly commanded admiration. H.'s style is spirited, flowing, and graceful; his versification almost always very smooth and harmonious. His poems display much geniality and tender feeling. Their humour is deli-

cate and refined. Few poets, and particularly few American poets, who have written well and acquired popularity like H., have written so little. His whole poems are included in a 12mo volume of very moderate size. H. died in November 1867.

HALLUIN, a town of France, in the dep. of Nord, 10 miles north-north-east of Lille. Weaving, bleaching, cotton-spinning, and brick-making are carried on, and there are manufactures of linen and calico. Pop. (1866) 8901.

HALOXYLIN, the name of a new kind of explosive material or blasting-powder, which has been invented in Styria by two brothers, and is described as incapable of spontaneous ignition, and as quite free from smoke and noxious gases. It is composed of non-resinous sawdust, charcoal, nitre, and ferrocyanide of potassium, and is twice the bulk of gunpowder, but one-half more powerful. For blasting and mining purposes, it is considered as preferable to gunpowder.

HA'MAH (Gr. *Epiphania*, and the *Hamath* of the Bible), a city of Syria, 120 miles north of Damascus. The town is built on both sides of the Orontes, which is here crossed by four bridges. A number of huge wheels, turned by the current, raise the water into aqueducts, which convey it to the houses and mosques of the town. The town is enclosed by walls, and the houses are built in the Damascus style of sun-dried bricks and wood. The principal structures are the governor's palace, many mosques, baths, bazaars, and the wheels and aqueducts already mentioned. There are manufactures of silk, cotton, and woollen fabrics, gold and silver thread. H. ranks among the oldest cities in the world. It was a noted place, and the capital of a little kingdom, when the Israelites came out of Egypt; and its name is mentioned in almost every passage in which reference is made to the northern border of the Promised Land. Pop. 30,000.

HANDICAPPING is the term used in various games and sports to denote the placing of competitors, good, bad, and indifferent, on such a footing that all shall have, as nearly as possible, an equal chance of winning. Thus, in horse-racing, when the speed of one horse has been ascertained to be greatly superior to that of another, the swifter of the two, in a handicap race, is made to carry extra weight to an amount that shall be deemed sufficient to reduce its speed to a level with that of its antagonist. Where the public performances of a horse have been exceptionally good, and when both speed and endurance are found to be of an unusually high character, the penalty inflicted in all future handicaps is very great, amounting sometimes to a weight several stones above that of very inferior competitors. The *beau idéal* of a handicap would thus be one in which the merits of the animals should be so nicely discriminated, and the weights so accurately adjusted, that all the competitors should pass the winning-post at the same time, and thus run a 'dead-heat.' This is, of course, impossible in practice, but it is nevertheless the ideal at which the handicapper must aim; and the nearer he approaches to it, the more perfect is his work. In racing, no jockey with his saddle, &c., must weigh less than five stone seven pounds, but the maximum is left in the hands of the handicapper, who apportions to each horse a weight corresponding to its public performances, age, and sex. No appeal is allowed from his decision, nor can he be called upon to give the reasons that may have actuated him in allocating weights. Vested with such arbitrary power, he should be a person of sound judgment, unquestionable integrity, and thorough experience. His usual mode of constructing a

handicap is to select the best and the worst horse entered for a race, placing such a weight upon the former as he supposes shall bring it down to a level with the latter's minimum of five stone seven pounds. He then proceeds to adjust the weights of the intermediate horses according to their varied merits.

When the handicaps have been published, no alteration can take place in the relative weights of the horses entered, unless one of these should prove a winner during the time intervening between the issue of the handicap and the period of its decision; in which case, extra weight, varying from three pounds and upwards, may have to be carried by the winning horse, as a penalty for his intermediate victory. Each jockey, with his saddle, &c., is weighed prior to starting, the exact extra weight to be carried being made up by lead strips let into the saddle-flaps. He is also weighed *after* the race, to prevent the possibility of his having carried either more or less than his proper weight; a precaution, moreover, that is rigorously observed after every kind of race, whether handicap or otherwise.

Though principally pertaining to horse-racing, handicapping is resorted to in many other sports. In pigeon-shooting from traps, the shooter stands, as a rule, 21 yards from the traps, that being the distance usually allowed to average performers. The more skilful the shooter, the further back has he to stand from the traps; the distance allowed by an acknowledged 'crack' shot to his inferior ranging from 1 to 10 or even 15 yards. In games such as chess and draughts, certain 'men' are allowed to the inferior player; in billiards, the better of two allows his antagonist a certain number of 'points,' so as to equalise or handicap their respective games; at cricket, the eleven of All England will sometimes play against twenty-two others, the competition being at times very close. In swimming and in pedestrianism, the inferior competitors are allowed a certain 'law,' or start; in yachting, the vessel of greater tonnage is handicapped with lesser ones, by allowing them extra time for the performance of the race. For instance, a fifty and a thirty ton yacht start for a race, the former allowing the latter, say, five minutes. They *start together*, and the heavier yacht reaches home, say, three minutes ahead of the lighter; in that case, the lighter yacht's handicap of five minutes gives her the race by two minutes, though she was last to reach home. The principle of handicapping is the same, whether applied to field-sports or home amusements; it is the art of endeavouring to equalise, by certain penalties, the good, bad, and indifferent.

HANLEY, a town of Staffordshire, England, in the district known as *The Potteries*, and included in the parliamentary borough of Stoke-upon-Trent (q. v.). It is two miles and a half from Newcastle-under-Lyme, about one mile from Stoke, and one mile from the North Staffordshire Railway station and canal offices. The principal portion of the town has an elevated site. The streets are not very regular, but they are wide and well paved; and many of the houses are well built. There are several commodious market-places. There are numerous places of worship of the Church of England and other denominations. Among the public institutions is an infirmary.—Contiguous to H. is **SHELTON**, which may be regarded as forming with it one town. The manufacture of earthenware and china is the principal employment of the inhabitants of both. At Shelton is a villa called *Etruria*, erected by Josiah Wedgwood, remarkable for the Etruscan vases with which it is ornamented, imitations of ancient vases found in Italy, and the study of which was of

great use to him in his endeavours to improve the manufacture of earthenware. The pop. of H. and Shelton together in 1861 was 31,953.

HARAR, a city of East Africa, in the country of the Gallas, the ancient metropolis of the Hadyah Empire, about 219 miles south-west of Berbera, which lies opposite to Aden, at the mouth of the Red Sea; lat. 9° 20', long. 42° 17'. The city, which is about 5500 feet above sea-level, lies upon the slope of a hill from west to east; in the latter direction are plantations of bananas, citrons, limes, the coffee-tree, the khat—a theine plant well known in Arabia—wars or 'bastard saffron' (safflower), and sugar-cane; westward are gardens and orchards on a terraced slope; northward is a hill covered with tombs; and to the south, the city falls into a valley or ravine. It is about one mile long by half a mile broad. The streets and alleys are like mountain-roads, strewn with rubbish and with heaps of rocks; and the abodes, built of sandstone and granite, cemented with a reddish clay, present a dingy appearance. H. is surrounded by an irregular wall, pierced with five large gates, and defended by rudely-built oval turrets. The men are very unprepossessing in appearance; but the women are much better looking, and appear to be of a different type. The men are engaged in trade; while the women spin, weave, and cultivate the gardens. Morals are very lax, and the people are much addicted to intoxication with mead and Abyssinian beer. The language of the inhabitants is Arabian, mixed with some apparently indigenous African dialect, and is spoken nowhere else. H. is celebrated for sanctity, erudition, and fanaticism, none but the purely religious sciences being studied. The people are extremely bigoted, and hold all foreigners, but particularly Christians, in hatred and contempt. The city is governed by an emir, whose will is law, who demands the utmost obsequiousness from all under him, but who administers his will with a certain amount of rude but prompt justice. Murderers are given up to the nearest kin, and their throats publicly cut with a butcher's knife. H. is essentially a commercial town. It is the grand dépôt for the coffee, the wars-dye, the cotton, the gums, the tobacco, and the grain of the Galla country, the produce of which is conveyed to Berbera three times a year in immense caravans. There is also an enormous slave-trade carried on, H. being a rendezvous for slave-caravans from all the surrounding countries. The imports are American cottons, shawls, silks, brass, copper, cutlery, dates, rice, sugar, gunpowder, and paper. Provisions are exceedingly cheap, 120 fowls, according to Burton, being purchased for a dollar, and the same sum sufficing to provide a man with bread for a year. The only coin is a bit of brass, coarsely stamped, equal to the 66th part of a dollar; and the emir imprisons all subjects who possess any other money.

H. was founded by Arab invaders, who, in the 7th c., conquered and colonised the tract between the Red Sea and the Abyssinian mountains. Pop. 10,000, inclusive of a considerable number of Gallas and other Bedonina. It was visited in 1855, at great risk, by the fearless and indefatigable Burton (q. v. in SUPPLEMENT), to whose interesting account we are indebted for most of our information.—See Burton's *First Footsteps in Eastern Africa* (Longman, 1856).

HARELD (*Harelda*), a genus or sub-genus of ducks of the oceanic section (see DUCK), nearly allied to pochards, scaups, &c.; having a short, thick bill, high at the base, the laminae projecting at the edge of the mandibles, a high forehead, a thick neck, and two feathers of the middle of the

tail in the males greatly elongated; whilst the females have the tail short and rounded.—The LONG-TAILED DUCK, or H. (*H. glacialis*), inhabits the arctic regions both of the old and new worlds, remaining on the seas of the north as long as any

Long-tailed Duck, Female and Male (*Harelda glacialis*).

water remains unfrozen, and then betaking itself to more southern regions. It is plentiful, during winter, in the inlets of Orkney and Shetland, but is rather rare in the southern parts of the British Islands. It is sometimes brought to the London market. Its winter migrations in America extend as far south as Texas. The male, particularly in its summer plumage, is a very beautiful bird. It is about 17 inches long, without the long tail-feathers; with them, 22 or 24. It is a very lively and noisy bird; flies swiftly, and is a most expert diver. It lines its nest with down, which is said to be equal to that of the eider, but has not yet become an article of commerce.

HA'ROLD'S CROSS, a village-suburb of Dublin, situated on the Grand Canal, three miles south-west from the centre of the city. It is built nearly in the form of a square, within which lies a spacious green, anciently the scene of periodical village festivals. The pop. in 1861 was 3839. It is the seat of a cotton-factory; and although the village is poor, there are many handsome villas in the vicinity, which is also remarkable for the handsome cemetery of Mount Jerome. H. C. also contains two convents of nuns, to which are attached free schools for the female children of the village.

HARVEST-FLY, the popular name in the U. S. for species of *Cicada* (q. v.) which are common in that country, and make their appearance as winged insects in the season of harvest. *C. septendecim* is called the *Seventeen Years' Locust*, from a popular belief that

Harvest-fly (*Cicada septendecim*).

it lives for that period in its larval state, a belief which seems to have arisen from the appearance of these insects in unusual numbers at intervals of about seventeen years. Its colour is black, the

wings and wing-covers veined with orange red. Near the tips of the wing-covers there is a dusky zigzag line in the form of the letter W, on account of which the appearance of this fly in great numbers is superstitiously regarded as indicative of approaching war.

HAUPUR, a town of British India, in the North-west Provinces, in the district of Meerut, 20 miles south of the town of that name. It is of considerable size, and has a pop. of 13,958. Government has a breeding-stud here, which has obtained celebrity for the character of the horses passed into the different branches of the service.

HAWKS, FRANCIS LISTER, D.D., LL.D., American clergyman and author, was born at Newbern, North Carolina, June 10, 1798; educated at the university of North Carolina; admitted to the bar in 1817; in 1819, elected to the state legislature; but being drawn to the church, he was ordained, in 1827, a clergyman of the Episcopal Church, and was engaged at New Haven, Philadelphia, and St Thomas's Church in New York, until 1843. During this period he was appointed historiographer of the Episcopal Church in America, and visited England in search of documents. In 1837, he founded, with Dr Henry, the *New York Review*, and established St Thomas's Hall, a high school, at Flushing, Long Island, which involved him in heavy pecuniary liabilities, charges based upon which were brought against him on his election in 1843 as Bishop of Mississippi. He was acquitted of the charges brought against him, but declined the bishopric. In 1844, he became rector of Christ's Church, in New Orleans, and president of the university of Louisiana. In 1849, he declined the bishopric of Rhode Island, and became rector of Calvary Church, New York. In this busy career he published *Reports of the Supreme Court of North Carolina* (4 vols., 1823—1828), *Contributions to the Ecclesiastical History of the United States* (2 vols., 1836—1840), *Egypt and its Monuments* (1849), *Auricular Confession in the Protestant Episcopal Church* (1850), a translation of Rovero and Tschudi's *Antiquities of Peru* (1854), and edited the papers of General Alexander Hamilton, biographical works, several juvenile books, *Commodore Perry's Expedition to the China Seas and Japan in 1852—1854*, and a portion of a *History of North Carolina*. He died in New York, September 27, 1866.

HAYES, AUGUSTUS ALLEN, American chemist, was born at Windsor, Vermont, February 28, 1806; educated at the military academy in his native town; studied chemistry under Professor Dana of Dartmouth College; and in 1825, distinguished himself by his researches into the proximate elements of American medicinal plants, discovering the organic alkaloid Sanguinaria; and in 1827, investigated the compounds of chromium. In 1828—having removed to Boston—in connection with the growing manufactures of New England, he devoted himself to the chemistry of commerce, of dyeing, and the manufacture of copper and iron. His numerous papers were published in the *Proceedings* of the Boston Society of Natural History, *American Journal of Science*, *Annual of Scientific Discovery*, &c. In 1837, his investigations into the generation of steam and economy of fuel, led to the construction of improved furnaces and boilers. He also discovered the process of reducing pig to malleable iron without loss by the use of the oxides of iron; new processes in copper-smelting, the decomposition of alcohol, and formation of chloroform; and the oxidation of alcohol in the human system. As state assayer of Massachusetts, and in the employ of the Federal government, he made important investigations into the

properties of guano; examined the constitution of sea-water at various depths, and its effects on the copper-sheathing of vessels; and by a series of useful studies and experiments has added to the national wealth and the domain of science.

HAYES, ISAAC T., M.D., American explorer, was born about 1830, educated to the medical profession, and appointed surgeon to the Arctic expedition under Dr Kane, with which he returned to the United States in 1855, convinced that there existed an open sea around the north pole, and anxious to head an expedition for its exploration. In this project he was aided by Mr Henry Grinnell, by the American Geographical and Statistical Society, and by Sir R. I. Murchison and the Geographical Society of London. In June 1860, he fitted out a schooner of 133 tons, and sailed from New York; July 6, 1860, penetrated to 82° 45' N. lat., making extensive explorations and observations of the coasts and their inhabitants, and returned to Boston October 1861, when, finding the civil war in progress, he volunteered as surgeon in the Federal army; and at the restoration of peace, published *The Open Polar Sea, a Narrative of a Voyage of Discovery toward the North Pole, in the Schooner United States* (New York and Lond. 1867); in recognition of which he was awarded a gold medal by the Royal Geographical Society.

HEDGEHOG PLANT, a name given to those species of medick (*Medicago*) which have the pods spirally twisted and rolled up into a ball, beset with spines. The peculiar appearance of the pods makes them objects of interest, on which account they sometimes find a place in flower-borders; and like the other Medicks (q. v.), they are useful in the countries in which they abound, as affording excellent food for sheep and cattle. They are particularly plentiful on sandy grounds near the sea in some parts of South America, and their pods are too plentiful in the South American wool imported into Britain.

HELIOTYPOGRAPHY (otherwise *Photoheliography*; from Gr. *helios*, the sun). Mr De la Rue, in the Observatory at Kew, has produced, on sheets of paper, pictures in which the solar spots are represented without the aid of drawing or engraving of any kind. In one form of operation (noticed in the *Proceedings* of the Royal Astronomical Society), the sun's spots were viewed through a Newtonian reflector of 18-inch object-glass and 10 feet focal length, producing an image that would have made the sun's disc three feet diameter. By a nice adjustment, the image of a portion of the disc was received on a glass-plate rendered sensitive by collodion. The first part of the process was then complete—the sun painting a picture of his own spots on a piece of glass. Then came the transfer of this negative to a positive, by the usual photographic means of printing, but with a varnish of very complex chemical nature on the positive plate. This completed the second stage—photography producing a very faint picture on the positive plate. Then came chemistry: by dissolving away certain constituents of the varnish, which had been more affected than the rest by the actinic force of the sun's light, the surface of the positive plate became a series of ridges and hollows, *relievi* and *intaglie*, extremely minute in their differences of level, but still sufficiently marked to convey the notion of a kind of engraving. Next came electrotype, or galvanography. The plate, in the state just described, served as a matrix or foundation on which an electrotype cast could be taken. By Pletsch's process, this cast may be so varied as to be available either for surface-printing or for printing on the

copper-plate plan. Under PHOTOGRAPHIC ENGRAVING, and those paragraphs of PHOTOGRAPHY which relate to *Celestial Photography* and *Photo-galvanography*, will be found details sufficient to render the subject of heliotypegraphy intelligible without further description.

HELMET-SHELL (*Cassia*), a genus of gastropodous molluscs of the family *Buccinidae*; the animal much resembling the common Whelk (q. v.), with which it also nearly agrees in habits; the shell swollen, rather thick and solid, with bold ridges, a short spire and a long aperture, the outer lip toothed, the canal recurved. The species, which are pretty numerous, are all natives of tropical seas. Most of them are beautiful; and they are used by engravers for making cameos, the differently coloured layers producing exquisite effects when skillfully out.

HELMOND, a town in the Netherlands, province of North Brabant, lies 21 miles south-east from Bois-le-Duc, on the Aa and South Willemsvaart. It has a good haven. The principal industries are the manufacture of cotton, woollen, and linen fabrics, cotton-printing, dyeing, calendering, beer-brewing, &c. In 1864, pop. 6576.

HELSINGBORG, an ancient fortified seaport town of South Sweden, 33 miles north-north-west of the town Malmö, on the Sound, opposite Elsinore. Steamers leave H. almost daily for Copenhagen, Malmö, Elsinore, and other places. There is a good harbour. Earthenware and iron goods are manufactured. Pop. (1864) 6602.

HEMP PALM (*Chamærops excelsa*; see **CHAMÆROPS**), a palm of China and Japan, the fibre of the leaves of which is much employed in these countries for making cordage. Hats are also made of its leaves, and even cloaks and other garments for wet weather.

HENLEY-ON-THAMES, a town of Oxfordshire, England, on the left bank of the Thames, 35 miles west from London. The Thames is here crossed by a handsome bridge. H. is on a branch of the Great Western Railway. There are several charities, and a reading-room and valuable library, open to all ratepayers, bequeathed by Dean Aldrich of Henley, who died in 1757. Malting is a principal branch of industry; there are also breweries; and there is a considerable trade in corn, flour, and timber. Pop. (1861) 3419.

HERI, HERI-RUD, or **HURI**, a river of Central Asia, which rises in the Hindu Kush Mountains, about 150 miles west from Cabul, pursues a western course through Afghanistan, for more than 300 miles through a fertile and beautiful valley, in which stands the city of Herat (q. v.); then bending suddenly to the northward along the boundary between Persia and Turkestan, and afterwards north-west through Turkestan, it has a further course of fully 400 miles, till it terminates in the swamp of Tejend, 150 miles to the east of the Caspian Sea. After entering Turkestan, the H. soon begins to lose its water in the sand of the desert, and the latter part of its course for hundreds of miles is dry, except at certain seasons of the year.

HERMES, GEORGE, a Roman Catholic philosopher and divine of Germany, whose system has been the occasion of a long and acrimonious controversy; was born at Dreyerwalde, in the diocese of Paderborn, in Westphalia, April 22, 1775. Having received his early education from his parish priest, H. entered the gymnasium of Rheina, and thence was transferred, in 1792, as a theological candidate, to the university of Münster, where he speedily distinguished himself, as well by his ability and

acuteness, as by his piety and exemplary life. In 1798, he was appointed Professor in the gymnasium of Münster; and after nine years, he was named Professor of Theology in the university of the same place. His lectures being of a popular character, and addressed mainly to the examination of the modern philosophical systems, and thus bearing on revelation, attracted many hearers, and established for H. a high reputation in Germany; and when, in 1819, the new mixed university of Bonn was established, H. was appointed to a professorship of theology. His early reputation attended him here, and students flocked to his lectures from all parts of Germany, and even from the Low Countries. In this office he continued until his death, which occurred May 26, 1831.

The great object which H. appears to have proposed to himself was to counteract the influence of the philosophical systems, which, when he entered on his career as a professor, were in the enjoyment of their full popularity, and especially that of Kant; and with this view, he sought to deduce the foundations of all philosophical inquiry from the same first principles from which the Kantian philosophy takes its departure. His system, therefore, presupposes in the mind, as the starting-point of all rational inquiry, a blank condition, which, as variously described by friends and enemies, is either simply the absence of all previous conviction, or a state of positive doubt, analogous to the so-called Pyrrhonism of the ancient schools. The Hermesian method of investigation, in like manner discards, in the first stages, and so far as investigation is permitted to extend, all principle of authority; and in the details of metaphysical inquiry, in the selection of the arguments of the existence of God, and of the nature of divine attributes, he departed widely from the old text-books of the schools; although in the general sum of the doctrines of the Roman Catholic Church, his orthodoxy does not appear to have been in any degree called into question. The objections which arose lay rather against his method than against its actual doctrinal results.

It is remarkable, too, that although his work, *Einleitung in die Christ-Katholische Theologie* (Introduction to Christian-Catholic Theology), was published in 1819, and again in 1831, it was not until after H.'s death that the controversy regarding his system took a definite form, and eventually, at the instance of Clement Augustus Droote-Vischering, Archbishop of Cologne, was referred to Rome. It would be out of place here to enter into the particulars of the controversy which ensued, the chief assailant of the system being a learned Italian professor of the Collegio Romano, the Jesuit, Father Perrone; while its defenders were almost exclusively Germans, most of them H.'s own friends and pupils. The controversy was a very protracted one; and a very large, although, it must be confessed, excessively dull and misty literature, has grown out of the subject. It will be enough to say, that after a protracted examination, the doctrine of H. was condemned by a brief, dated September 26, 1835. The German partisans of H., who had at their command a theological journal of considerable circulation, the *Journal of Bonn*, protested from the first against this condemnation, to which they applied, at least practically, the well-known distinction of 'fact' and 'right,' which had been long ago employed by the Jansenists; contending, that although the doctrines contemplated by the brief were rightly condemned, as being unsound and untenable, yet no such doctrines were taught by H., or contained in his book. Two of the leaders of the party, Professors Braun and Elvenich, went to Rome to urge a reconsideration of the condemnatory decree; but their

mission was unavailing, and the decision was ordered to be enforced without reserve. The Archbishop of Cologne accordingly insisted on unqualified submission; and the troubles which arose from the opposition which he encountered, tended much to complicate the difficulties of a conflict which arose between him and the Prussian government, as to the question of 'mixed marriages,' and which led eventually to his arrest and deprivation by the crown. The controversy was continued, as well in Rome as in Germany, for a considerable time; by degrees, however, the Hermetian party fell away. The professors of various universities, individually or in bodies, accepted the papal condemnation; and although some have still persevered in their resistance down to a comparatively late period, they have been almost exclusively of that extreme party, many of whom openly seceded from Rome, under the name of the German Catholic Church, and whose principles go even beyond orthodox Lutheranism, and may be regarded as verging on the most advanced borders of Rationalism.

HERMOSILLO, a city in the north-west of Mexico, in the state of Sonora, on a river of the same name, about 60 miles east from the Californian Gulf, and 90 north of the port of Guaymas. The town lies in a valley, 10 miles long by 4 broad. The climate is dry and very hot, but the place is nevertheless considered healthy, being free from the epidemics which often accompany very high temperatures. The valley is very fertile, and produces grapes, melons, figs, oranges, limes, lemons, citron, peaches, and pomegranates in great abundance. The vine, however, is the principal object of cultivation, not less than 1500 barrels of brandy being annually made. The town has a large trade with Guaymas, being the principal entrepôt for the trade with the interior. Pop. about 18,000, including about 3000 Yaqui Indians, who are the labourers of the town.

HERRING, VANCOUVER ISLAND (*Meletta cerulea*), a fish of the same family with the herring, and much resembling it both in appearance and otherwise. The genus *Meletta* differs from *Clupea*, to which the herring belongs, chiefly in having no teeth, except that name may be given to a rough band on the tongue. The Vancouver Island herring abounds on the north-western coast of North America. It is generally about ten inches in length. Its colour is bright steel blue, shading away on the sides to brilliant silvery white, the fins yellowish white. Immense shoals of these herrings appear on the coast at different seasons from February to July; often pursued by dogfish, so that fleeing from the enemy, they even rush upon the shore, where great numbers die among the pebbles. They afford a chief part of the sea-harvest of the Indians, who take them by various means—by the rake, such as is used for the Candle-fish (q. v.), for the shoals often so fill the water that it may be employed; by hand-nets; and by long dams of lattice-work, along the outside of great mud-flats left dry by the retiring tide. The spawn of this fish is also a favourite article of food of the Indians, and is obtained by placing great quantities of fir branches in the mud over the flats, within the dams used for catching the herring. The spawn gets entangled among the branches, and is removed to be dried in the sun. Great numbers of the herring caught by the Indians are used only for the extraction of oil. The Vancouver Island herring seems likely to acquire a great commercial importance.

HERZ, HENRI, a pianist and composer for the pianoforte. He was born, of Jewish parentage, at Vienna, in 1806, and educated principally in

Paris, where his talent was early recognised; and his compositions became popular over Europe. He was received with great applause on visiting England in 1834, and America in 1846. In 1837, he received the decoration of the Legion of Honour. H.'s music is characterised by elegance and a certain originality, and holds an important place among works written for the pianoforte.

HEYWOOD, a large and populous town of Lancashire, England, eight miles north from Manchester, on the left bank of the Roach, a branch of the Irwell. It is not far from the Rochdale Canal, with which it is connected by a branch canal; and it is on the line of the Lancashire and Yorkshire Railway. H. has recently increased with great rapidity, both in population and wealth, partly in consequence of extensive coal-mines in the neighbourhood, and partly through manufactures of various kinds. It has become an important seat of the cotton manufacture, there being more than fifty large factories in the town and vicinity. Fustians, calicoes, nankens, ticks, and other cotton fabrics are produced. Iron-founding, boiler-making, and the manufacture of power-looms, are also extensively carried on. H. is situated in the parish of Bury. Pop. (1861) 12,824.

HILDEN, a town of Rhenish Prussia, nine miles east-south-east from Düsseldorf, on the Itterbach. It is a rapidly-increasing place, with woollen and linen manufactures. Pop. (1864) 5623.

HYLVERSUM, a beautifully situated village in North Holland, lies 15 miles south-east from Amsterdam, in the midst of undulating corn-fields, variegated with woodlands. The chief industries are agriculture, the manufacture of strong striped white cottons, carpets, and horse-cloths, spinning and dyeing wool. There are two public schools, with 600 pupils, an institute for young ladies, and another for young gentlemen, a Reformed Church, a Roman Catholic Church, and a Jewish synagogue. Pop. (1864) 6196.

HINDLEY, a town of Lancashire, England, three miles south-east from Wigan, with which it is connected by railway, on the Manchester Road. Its growth has of late years been rapid. There are numerous coal-works in the vicinity; cotton-spinning and the manufacture of cotton goods are also extensively prosecuted. There are places of worship belonging to the Church of England, and to a number of other denominations; a free grammar-school, and numerous other schools. Pop. (1861) 8477; (1867) about 10,000.

HIPPOPHAGY. The adoption of horse-flesh as food for man has at various times occupied the attention of physicians. That semi-civilised nations eat horse-flesh is well known. Witness Sir John Chardin's Account of the Crim-Tartars, who, he tells us, when their horses were worn out, killed them, and cut up the best parts of the flesh into steaks about an inch thick. The Tartar rode for hours with such a steak between his saddle and his horse, then dismounted, turned the steak, mounted again, rode several more hours, and then found the steak tender enough for eating. A writer in *Notes and Queries* draws attention to a book, written by a Spanish prelate in the time of the Emperor Charles V., in which mention is made of a grand Spanish banquet, comprising roasted horse-flesh among the vianda. Burton, in his *Anatomy of Melancholy*, says: 'Young foals are as commonly eaten in Spain as red-deer; and to furnish their navies, about Malaga especially, often used'—probably as ship salt-provisions.

In 1855 and 1856, there was a good deal of discussion in Paris relative to the formal introduction

of horse-flesh into the meat-markets. M. Geoffrey St Hilaire delivered a lecture declaratory of the wholesome character of this food; and some of the more enthusiastic advocates of the plan formed themselves into a so-called Hippophagii, or Horse-eating Society. The French are famous for their skill in so modifying the operations of cookery as to obtain as many varieties of flavour as possible with any and every kind of meat; and this skill was exercised abundantly in disguising (if not removing) the somewhat coarse taste and odour of horse-flesh. The journals of the time spoke of banquets held by the Hippophagi, in which the principal dishes were horse-flesh, variously cooked and diversified.

In 1866, there was official recognition of the introduction of this kind of food into the market, under such restrictions as were deemed suitable. According to a statement in the *Journal of the Society of Arts*, the Prefect of the Seine issued an ordonnance in June of that year, recognising horse-flesh as human food, establishing special slaughter-houses or abattoirs for it, and laying down detailed regulations. No ordinary horse-slaughterers, but only those specially appointed, are to engage in the trade. The animals are to be killed in presence of a veterinary inspector, who is also to stamp or seal every distinct joint of meat after inspection. Unhealthy horses are excluded from the supply; they may be old, and worn out for work, but still healthy (the supply mostly comes from Normandy). All restaurateurs who use horse-flesh in their potages, bouillies, &c., are to acquaint their customers distinctly with the fact. Within a few weeks after the issue of the ordonnance, there were establishments for horse-flesh bouillie and soup, and others for horse-flesh sausages, in Paris, avowedly sanctioned by the authorities. In November, there were said to be twenty tons of this meat sold weekly; the better portions being used by the keepers of cheap restaurants, and the remainder sold for various purposes at about twopence per pound. The decision pronounced upon the better portion of horse-flesh, by the medical men of Paris, is, that it bears some such relation to ox-beef as brown bread does to wheaten—quite as wholesome, but not so pleasant in taste.

During the continuance of the French International Exhibition of 1867, some of the humbler restaurants of Paris were much visited by diners on horse-flesh, which was in many cases served up in three or four courses dressed in different ways.

There has been something achieved also in France in feeding poultry with this kind of diet. One establishment was described, in 1864 (in the *Journal* above quoted), as covering 30 acres, furnishing accommodation for 100,000 pullets at one time. The pullets were divided into groups, according to age, each group having its own yard and dormitory. The proprietors had horse-abattoirs of their own, where they killed horses bought for the purpose. The purchase-money was recovered by selling the hides to tanners, the heads and hoofs to Prussian-blue makers, the marrow to perfumers, the bones to button-makers, the hair to horsehair-workers, the intestines to the makers of musical strings and gold-beaters' skin, the tendons to bowstring-makers, the blood to certain manufacturers, and the horseshoes and nails to dealers in old iron; and then the flesh was clear profit. The flesh was boiled and chopped small, and given as food under certain regulations. It was found more profitable to rear poultry for the sake of the eggs than for the chickens, as the hens laid all the year round. In the winter 1863—1864, there were 40,000 dozen eggs sent weekly to market, where they brought about sixpence per dozen. It was found that each hen yielded twelve

shillingsworth of eggs annually for four years, at the end of which time she was fattened for three weeks on bruised grain, and sent alive to market. The refuse of this great establishment, owing to the peculiar effects of horse-flesh upon the poultry, was found to be a very rich and valuable manure.

HITCHIN, a town of Hertfordshire, England, 14 miles north-west from Hertford, on the Hiz, a branch of the Ivel, and feeder of the Ouse, 420 feet above the sea. It is a station on the Great Northern Railway, and from it important lines of railway branch off to Bedford and other places on the north-west, and to Cambridge, &c. on the north-east. The town is irregularly laid out, but generally well built, with spacious streets. The principal trade is in corn, malt, and flour. There are several large breweries. Many females are employed in straw-plaiting. There are lavender farms in the neighbourhood. H. was a place of some consequence in the days of King Alfred. Pop. (1861) 6330.

HOAZIN, or TOURACO (*Opisthocomus cristatus*), a bird nearly as large as a peacock, which it somewhat resembles in its gait and manners; a native of Guiana and Brazil; generally referred by

Hoazin (*Opisthocomus cristatus*).

naturalists to the family *Cracida* (with curassows and guans) and the gallinaceous order; but by some regarded as of the order *Inessorores*, and as allied to the plantain-eaters. Its anatomy is remarkable: it has an enormous crop, whilst the gizzard is very small. It is gregarious, and frequents marshy situations.

HOFFMANN, ERNEST THEOD. AMADEUS, properly WILHELM, one of the most original German story-tellers, was born 24th January 1776, at Königsberg in Prussia. He studied law there, and then found employment in the government offices at Grossglogau and in Berlin. In 1800, he became assessor to the government in Posen; but in consequence of some able caricatures of his, which General Zastrow and others, in high positions applied to themselves, he was removed in 1802, as councillor, to Plock, and 1803, in the same capacity to Warsaw, where the entrance of the French ended his career. Without prospects or fortune, he made use of his knowledge of music as a means of livelihood, and, though sometimes reduced to great straits, managed to support himself by giving music-lessons, and by contributing to the *Musical Gazette* of Leipzig. In 1813, he went to Dresden as music director to a company of players alternating between Dresden and Leipzig, and continued to conduct the orchestra of the company till 1815. In 1816, he was again appointed by Prussia to be councillor in the Royal Supreme Court of Judicature at Berlin, where, before long, he was seized with a disease in his back,

the consequence of his irregular life, and after much suffering, died 24th July 1822. From his youth, he had devoted all his leisure hours to the study of music. In Posen, he brought Goethe's vaudeville, *Scherz, List, und Rache*, on the stage, and composed at Warsaw the music for numerous pieces at other theatres. The request for a collection of his compositions which had appeared in the *Musical Gazette*, induced him to publish his *Phantasiestücke in Calot's Manier* (4 vols. Bamb. 1814; 3d ed. 2 vols. Leip. 1825). These were followed by *Élécire des Teufels* (Berl. 1816), *Nachtstücke* (2 vols. Berl. 1817), and *Die Serapionsbrüder* (4 vols. Berl. 1819—1821, along with a supplement, 1825, containing H.'s last stories); *Lebensansichten des Kater Murr* (Views of Life, by Kater Murr, 2 vols. Berl. 1821—1822), *Der Doppelgänger* (The Double-goer, Brünn, 1824), and a few shorter stories. H. was a man of thorough originality, and gifted with the rarest talents; wild, licentious, and yet an excellent man of business and lawyer, who performed the duties of his office well. He had a keen understanding, which speedily detected the weaknesses and absurdities of everything. At the same time he shewed himself full of fantastic ideas, and a believer in demons. His character was made up of incongruities: he was bitterly sceptical, and yet visionary to insanity; epicurean to effeminacy, and stoical to rigidity. Between these contradictory extremes range his novels, which, like his whole character, betray something diabolical. In his humorous flights, he reminds us of Jean Paul, whom he perhaps surpasses in real interest and in inventive power, but whom he falls far short of in depth of humour, purity, and power of language. H.'s fancy revelled in mysterious caricatures, presenting a frightful contrast between jest and earnest. The wonderful apparitions which he introduced into his stories, as taking part in daily life, were part of his ordinary way of thinking. However, although these fantastic creations are often amusing and interesting, it is neither on these nor on his larger novels, so often wild and odd, that his fame rests, but more on his novelettes, which are masterpieces in miniature, such as *Meister Martin und Seine Gesellen*; *Das Majorät*; *Fräulein Scudéry*; *Doge u. Dogaresse*; &c., which are not mixed up with spectral machinery. H.'s talents were most wonderfully various; he not only distinguished himself as a poet and composer, but as an able sketcher of caricatures; and many of the most popular caricatures of Napoleon were from his pencil. He handled language in a masterly way, although not free from mannerism. A collection of his choice works, *Ausgewählte Schriften*, appeared in Berlin (10 vols., 1827—1828). His widow, Micheline, born Rover, added five supplementary volumes (new ed. Stuttg. 1839). There is an excellent biography of H. by his friend J. E. Hitzig, in his work *Aus H.'s Leben und Nachlass* (2 vols. Berl. 1823). In foreign countries, particularly in France, H. has been repeatedly translated and imitated.

HOFFMANN, AUG. HEINRICH, commonly called HOFFMANN VON FALLERSLEBEN, a distinguished German poet and meritorious philologist, was born 2d April 1798, at Fallersleben, in the district of Luneburg, where his father was a merchant and burgomeister. Having received his elementary education in Helmsted and Brunswick, he went, in 1816, to the university of Göttingen, which, in 1819, he left for Bonn. He soon gave up theology, which his father had destined him to, and occupied himself exclusively with philological and literary studies, which, from his first acquaintance with the Brothers Grimm (1818), turned more and more to his native language and literature. After travelling through the Rhine countries and Holland in search

of popular poetry, and living for some time in Berlin, he was made keeper of the university library at Breslau in 1823, Extraordinary Professor of the university there in 1830, and Ordinary Professor of the German Language and Literature in 1835. The publication of his *Unpolitische Lieder* (Unpolitical Lays) led to his being deprived of his office, 20th December 1842. For some years afterwards, H., thrown entirely upon literary work for his support, led a wandering life through the whole of Germany, Switzerland, and Italy, the subject of laudation on the one hand, or of vituperation on the other, and at times kept under the surveillance of the police. In 1845, he was naturalised in Mecklenburg. Restored to his rights in Prussia 1848, he drew from that time his statutory salary as a pension. He married in 1849, and settled on the Rhine, first in Bingerbrück, then, 1851, in Neuwied, until, in 1854, he went to Weimar, and for some years (1854—1857) edited the *Weimar Annual*. In 1860, he became librarian to the Duke of Ratibor at the castle of Korvei, on the Weser. H.'s literary productions are partly of a scientific, partly of a poetical kind. Through the first, he ranks among the most distinguished investigators in the department of German language and literature. The following writings deserve special mention: *Horæ Belgicæ* (vols. 1—3, Leip. and Berl. 1830—1837); *Reineke Vos* (Berl. 1834, 2d ed. 1852); *Monumenta Elmonensia* (Gent. 1837); *Geschichte des Deutschen Kirchenlieds bis auf Luther* (History of German Hymnology, Breal. 1832, 2d ed. 1853); *Alteutsche Blätter* (Old German Fragments, 2 vols. Leip. 1835—1840); *Politische Gedichte aus Deutscher Vorzeit* (Political Poems from German Antiquity, Leip. 1843); *Deutsche Gesellschafslieder des 16 und 17 Jahrhunderts* (German Social Songs of the 16th c. and 17th c., Leip. 1844); *Spenden zur Deutschen Literaturgeschichte* (Contributions to the History of German Literature, 2 vols. Leip. 1845); *Theophilus* (Han. 1853); *Die Deutsche Philologie im Grundriss* (German Philology in Outline, Berl. 1836). H.'s own poetry has a close alliance to popular song, and hits the tone of genuine simplicity, tenderness, and pathos to a degree that scarcely any other poet of recent times has succeeded in doing. Many of these songs actually circulate among the people from mouth to mouth. It is also remarkable that H., although not a cultivated musician, sets his songs to the most delightful tunes himself, which only require artistic finishing. His juvenile songs are especially charming; his love-songs are not less tender; and his poetical pictures of the life and way of thinking of the German people, such as the drinking and rustic songs, are unique in their kind. The following collections may be particularly mentioned: *Allemannische Lieder* (Allemannic Songs, 5th ed., Manh. 1843); *Gedichte* (Poems, 2 vols. Leip. 1834, 6th ed. Han. 1864); *Rheinleben* (Rhine-life, Mainz, 1851; Neuwied, 1865); *Soldatenlieder* (Soldiers' Songs, Mainz, 1851); *Fünfzig Kinderlieder* (Fifty Children's Songs, Leip. 1843); *Fünfzig neue Kinderlieder* (Fifty New Children's Songs, Manh. 1845); *Vierrzig Kinderlieder* (Forty Children's Songs, Leip. 1847); *Deutsches Volksgeangbuch* (German Popular Song-book, Leip. 1848). Of a different kind, but also popular by their airs, are the *Unpolitische Lieder* (Unpolitical Lays, 2 vols. Hamb. 1840—1841), which excited great attention. With these are connected *Deutsche Lieder aus der Schweiz* (Swiss German Songs, Zür. 1843; Altona, 1862); *Deutsches Liederbuch* (German Song-book, 2d ed. Leip. 1850).

HOG-GUM, the name given in the West Indies to a resinous substance, which is there extensively used as a substitute for pitch, to tar boats and ropes, also for strengthening-plasters, &c., and

internally as a diuretic, laxative, and stimulant medicine. It is still disputed what tree produces the true hog-gum; some ascribing it to *Moroneba coccinea*, of the natural order *Guttifera*; some to *Rhus metopium*, a species of sumach, of the order *Anacardiaceae*; and some to *Helwigia balsamifera*, of the order *Amyridaceae*. The probability seems to be that all these—and perhaps other—trees yield resinous substances of very similar quality, and commonly designated by the same name.

HÖHESCHEID, a town of Rhenish Prussia, 17 miles east-by-south from Düsseldorf. It has extensive lead-works and iron-works. Pop. (1864) 9013.

HOLLOW-WARE. There are two classes of iron goods so called—viz., cast-iron hollow-ware, and wrought-iron hollow-ware. Both kinds include cooking and other vessels for domestic use, and comprise also some other articles, such as coffee-mills, which are moulded and finished in a similar way. Wrought-iron hollow-ware is largely made by the process of Stamping (q. v.), but a great deal is also made by the older way of joining pieces together. Vessels of this kind not intended for cooking are generally coated with zinc, while those which are, have usually a coating of tin. Both metals are put on the iron by immersion. There is also a process in use for coating the surface with silicious enamel, which will be described presently. Since the introduction of these methods of protecting and beautifying the surface of iron, domestic vessels of this metal have greatly taken the place of those made from copper and brass.

Cast-iron hollow-ware is finished in three ways—some of it is enamelled, some tinned, and some of it is left black, or untinned; but there is comparatively little of the last now used. The process by which tinned hollow-ware is made was patented by Jonathan Taylor, a Birmingham workman, in 1779. It is conducted as follows: A vessel, such as a saucer-pan or goblet, is cast in a mould prepared in the ordinary way from an iron or a brass pattern. See **FOUNDING**. The vessel is then Annealed (q. v.), so as to soften the cast-iron preparatory to turning, and such articles are then turned quite smooth on the inside, by means of a common lathe when they are circular, and by an oval lathe when they are oval like fish-pans, a workman holding and directing the tool in both cases. Self-acting lathes have been tried, but hitherto without any saving in the cost. The operation of tinning follows next, and is performed by the workman pouring small quantities of melted tin on the inside of the vessel, which he rubs on with a piece of cork, gradually going over the whole surface. A little sal-ammoniac is thrown in during the process to make the tin adhere. Handles of malleable iron are then put upon such vessels as require them, and a final finish is given to them by coating the outside with a black varnish which is dried in a stove. The covers of saucers are made of tin-plate, those for tea-kettles of cast-iron.

With respect to the enamelling of cast hollow-ware, a patent was taken out for this as far back as 1799; but the process then introduced, in which the enamel contained lead and tin, was ultimately abandoned. The subsequent patent of Messrs T. and C. Clark of Wolverhampton, taken out in 1839, has been more successful. Their enamel is applied to the cast-iron in two coatings, one of which forms the body of the enamel, and the other the glaze, both being free from metallic oxides. It is especially desirable to avoid the oxide of lead, as it does not resist the action of acid substances in culinary operations. As iron, in common with most metals, differs from any vitreous enamel in the rate

of its expansibility by heat, there is of course a difficulty in securing the permanent adhesion of the two substances, especially with such an article as a cooking-vessel. In the case of cast-iron vessels, however, the difficulty has been practically overcome.

In England, cast hollow-ware is made chiefly in the Midland hardware district, of which Birmingham and Wolverhampton are the centres. Eight manufactories make tinned, and two enamelled hollow-ware. A few more make the black or untinned kind. About 2500 hands are employed, and the quantity of materials annually consumed is estimated at 12,000 tons of pig-iron, 1000 tons of wrought-iron, 177 tons of tin, and 23,000 tons of coke and coal. In Scotland, there are six manufactories of tinned hollow-ware—that of the Carron Company, whose goods have long been famous; the Shotts Iron Company; the Falkirk Iron Company; and three in Glasgow. Wrought-iron hollow-ware is made principally in Birmingham and the surrounding district, and the number of hands employed upon it is probably nearly the same as for cast-iron goods of this kind.

English hollow-ware is sent to most civilised countries, but for export trade the best markets are found in the British colonies. Little or none is taken by France, and scarcely any by the United States since the outbreak of the civil war, on account of the high duties.

With regard to the comparative merits of the different varieties of hollow-ware, there is no doubt that the kind made of enamelled cast-iron is, on the whole, the best for cooking purposes, although it is about one-fifth dearer than when merely tinned, and is, moreover, not liked by cooks for any but small-sized vessels, on account of its being somewhat heavy. Enamelled wrought-iron cooking-vessels are much lighter to handle, but then upon them the enamel does not stand nearly so well, very probably because the comparatively rapid heating up of the thin iron of which they are made, more rapidly destroys the adherence of the two substances. A great deal of cast-iron tinned hollow-ware is now made without being turned, an omission easily detected by the uneven surface which the inside of such vessels presents. Articles so finished are, of course, cheaper than when they are smoothed on the lathe; but for look, durability of the tinned surface, and least trouble of cleaning, those which are turned are decidedly preferable.

HOLY FIRE, in the Church of Rome, a light kindled at Easter, by sparks struck from a flint, in remembrance—according to the missal—of Christ as the great corner-stone, and hailed by kneeling ecclesiastics with the words 'Light of Christ' (*Lumen Christi*). The ceremony takes place on Holy Saturday, of which day's service it forms a striking part; and at Rome, it takes place in the presence of the pope himself; all the lights in the chapel having been previously extinguished, to be rekindled at the new fire.—The kindling of the Holy Fire in the Church of the Holy Sepulchre at Jerusalem, at the Easter of the Oriental Church, is represented as miraculous. The Greek and Armenian clergy combine on this occasion, and amidst processions, solemnities, an excited multitude, and scenes disgraceful not only to the name of religion but to human nature, the expected fire makes its appearance from within an apartment in which a Greek and an Armenian bishop have locked themselves.

HOP FROTH-FLY, or **HOP FROG-FLY** (*Amblycephalus interruptus*), a species of Froth-fly (q. v.) which sometimes appears in great numbers in

hop-grounds, and does considerable mischief. The perfect insect is about a quarter of an inch long, of a yellow colour, variegated with black. It frequents hedges and grassy places as well as hop-plantations.

HÖRDE, a town of Prussian Westphalia, on the Emsche, 33 miles south from Münster, with which it is connected by railway. Near it are productive coal-mines, and the town has recently increased with great rapidity. Nail-making is carried on. Pop. (1864) 8151.

HORNBOOK, the primer or apparatus for learning the elements of reading, used in England before the days of printing, and common down to the time of George II. It consisted of a single leaf, containing on one side the alphabet large and small, in black-letter or in Roman, with perhaps a small regiment of monosyllables. Then followed a form of exorcism and the Lord's Prayer, and as a finale, the Roman numerals. The leaf was usually set in a frame of wood, with a slice of transparent horn in front—hence the name of *horn-book*. There was a handle to hold it by, and usually this handle had a hole for a string, whereby the apparatus was slung to the girdle of the scholar. Sometimes the leaf was simply pasted against a slice of horn. At first, the leaf was of vellum, with the characters in writing; latterly, of paper, and printed. The horn-

of them are now exceedingly rare. The annexed representation is copied from one given by Mr Halliwell, as taken from a black-letter example which was found some years ago in pulling down an old farmhouse at Middleton, in Derbyshire. A portrait of King Charles I. in armour on horseback was upon the reverse, affording us an approximation to the date. In *Notices of Fugitive Tracts*, printed for the Percy Society (1849), Mr Halliwell figures a more perfect specimen, which he assigns to the time of Elizabeth. Allusions to the hornbook abound in the older writers; Shenstone, e.g., in *The School-mistress*, tells us of the children, how

'Their books of stature small they take in hand,
Which with pellucid horn secured are,
To save from fingers wet the letters fair.'

HORODENKA, a town of the Austrian Empire, in the province of East Galicia, on an affluent of the Dniester, 106 miles south-east from Lemberg. Pop. 8451.

HOTCH-POTCH, a Scottish dish, may be defined as a kind of mutton-broth in which green peas take the place of barley or rice. This is a dish only to be obtained in perfection in summer, when green peas are in season. Put on two quarts of water, and when it boils, put in three pounds of the back-ribs of mutton or lamb, paring off the fat if there be too much. Put in with the meat two or three carrots cut into squares, and two grated, also three or four sweet young turnips in squares, a cauliflower and a lettuce cut down, a few young onions shred, a little parsley, and about a pint of sweet young peas. Boil this for an hour and a half, then take out the meat, and cut it in chops, laying it aside. Add another pint of young peas, seasoning with pepper and salt; and when these peas are done, put in the chops. In a few minutes afterwards, serve up the whole in a tureen. Instead of cutting the meat into chops, it is not unusual to keep it whole, and serve it separately. Neck of mutton makes excellent hotch-potch. The composition of the mess may be varied by the addition of beans, white cabbage sliced, or asparagus points. Some boil the empty hulls of the peas in a little water apart, and add the strained liquor to the rest, which gives additional sweetness. Hotch-potch is considered the *chef-d'œuvre* of Scottish cookery.

HOUGHTON-LE-SPRING, a town of the county of Durham, England, nearly 7 miles north-east from Durham, on the Great Northern Railway. The town of H. has recently much increased, and owes its prosperity mainly to the numerous coal-mines of the neighbourhood, the coal produced by which is of the most excellent quality. Pop. (1861) 3824. The surrounding district is very populous, and contains numerous villages.

HUBERTUSBURG, a royal hunting-seat, not far from Leipzig, built in 1721 by Augustus III., then prince, afterwards king and elector. It was much injured during the Seven Years' War, and has a historic celebrity on account of the treaty by which that war was ended, called the Peace of Hubertusburg. This treaty of peace was signed here on 15th February 1763, by the representatives of Prussia, Austria, and Saxony; and by it the position of Prussia was established amongst the great powers of Europe. Maria Theresa relinquished all claim to the provinces which had been acquired by Prussia; and Frederick the Great restored his electorate to the king of Poland, Elector of Saxony.

HUFELAND, CHRISTOPHER WILLIAM, one of the most distinguished physicians of modern times, was born on 12th August 1762, at Langensalza in

Hornbook—17th century.

book was prefaced and otherwise ornamented with figures of the cross, and hence came to be often called Christ Cross Row, or Cross Cross Row. Common as hornbooks at one time were, copies

Thuringia. After having completed a general and medical education at the best schools in Germany, he was appointed physician in ordinary at the court of Weimar, where his father and his grandfather had previously filled the same office. Retaining this honorary title, he removed in 1793 to Jena, to be ordinary professor of medicine there; and after refusing a number of invitations to other places, he went from Jena to Berlin in 1796 with a number of very honourable professional appointments. On the foundation of the university of Berlin in 1809, he became one of its professors. He died 25th August 1836. He had a very high reputation for skill and tenderness as a physician, and he was equally esteemed for his intellectual abilities and his noble and benevolent character. A number of benevolent societies and institutions owed their existence to him, and many others found in him a zealous and liberal supporter. His published works are numerous, chiefly on medical and physiological subjects. His *Makrobiotik*, or the Art of Prolonging Life, originally published in 1796, was translated into almost all the languages of Europe. Translations exist in Servian, Hungarian, and Hebrew. Amongst his most important works are one on Scrofula, *Ueber die Ursachen, Erkenntnis, und Heilung der Skrofulkrankheit* (Berlin, 1795), which has gone through several editions, and has been translated into several languages; an advice to mothers on the Physical Treatment of Children, published in 1799; and his *Enchiridion Medicum*, or Introduction to the Practice of Medicine, published in 1836.

HUGHES, THOMAS, English author and politician, second son of John Hughes, Esq. of Domington Priory, Newbury, Berkshire, was born at Uffington, Berks, in 1823. He was educated at Rugby under the celebrated Dr Arnold; entered Oriol College, Oxford, in 1841, and took his degree of B.A. in 1845; was called to the bar at Lincoln's Inn in 1848, and became a member of the Chancery Bar. In 1856, he gave to the world *Tom Brown's School-days*—a picture of life at a public school, evidently written from the author's own personal experience, and recording the vivid and enduring impressions he brought with him from Rugby. This work attained great popularity both in England and America, especially among the young. It was followed, in 1858, by *The Scouring of the White Horse*; and in 1861, by *Tom Brown at Oxford*, in which the mental history of his hero is continued, with sketches of college life and incidents. H. pursued meanwhile the study and practice of the law. He gained the confidence and good-will of the working-classes by endeavouring to promote a better understanding between masters and men, and by teaching the latter the value of co-operation as a means of social elevation. He has, however, never failed courageously to rebuke the narrow prejudices and mischievous views held by certain members of trades-unions. At the general election for Lambeth in 1865, he was placed at the head of the poll, the working-men being especially enthusiastic in securing his return. He took his seat on the Liberal benches, and has since taken a prominent part in debates relating to the combinations of trades-unions, and the amendment of the law of master and servant. H. is the author of some pamphlets, and has written various articles in reviews and magazines, together with prefaces to the works of J. R. Lowell and other American authors.

HUMMEL, JOHANN NEPOMUK, an eminent pianist and composer, born at Preeburg in 1778. His earliest musical instructions were derived from his father, the director of the Imperial School of military music; after which he went to Vienna,

where Mozart, forming a high opinion of his talents, took him under his tuition. He appeared in public in 1787, being then but nine years of age, at a concert given by Mozart in Dresden; after which he gave concerts in Germany, Denmark, England, and Holland. In London, H. had the advantage of Clementi's instructions in 1791; and in Vienna, in 1793, he took lessons from Albrechtsberger in composition, and from Salieri in dramatic writing. From 1803 to 1811, he held the post of Kapellmeister to Prince Nicholas Esterhazy; and he was at a later period Kapellmeister at Stuttgart and Weimar. He visited Paris for the first time in 1822; and in 1833 became conductor of the German Opera at the King's Theatre in London. He died at Weimar in 1837. H.'s pianoforte works rank among the purest and most classical compositions for that instrument—his concertos are full of artistic skill; he has besides composed masses, which are in high esteem, and several now nearly forgotten operas and cantatas. His playing was characterised by the same solid qualities as appear in his compositions.

HUSCH, a town of Moldavia, on a feeder of the Pruth, 40 miles south-east from Jassy. It is the capital of a district. Here the treaty between the Russians and Turks was signed in 1711. Pop. 1860) 12,764.

HUXLEY, THOMAS HENRY, naturalist and comparative anatomist, born at Ealing, Middlesex, in 1825, was educated at the school in that town, and afterwards studied medicine in the Medical School of Charing Cross Hospital. In 1846, he entered the medical service of the royal navy, and did duty at Haslar, under the late Sir John Richardson, until the winter of the same year, when he was appointed assistant-surgeon on board the *Rattlesnake*. This vessel, commanded by Captain Owen Stanley, was commissioned to survey the intricate passage within the Barrier Reef skirting the eastern shores of Australia, and to explore the sea lying between the northern end of that reef and New Guinea and the Louisiade Archipelago. Imbued with a passion for natural history, Mr H. devoted himself with zeal and intelligence to the study of the numerous marine animals collected from time to time during the survey, and made them the subjects of scientific papers, which he sent home, diffident as to their value. They were published, however, by the Royal Society and the Linnæan Society, and made their author known, while yet a young man, to the naturalists of Europe. Towards the end of 1850, the *Rattlesnake* returned to England, and Mr H. had the gratification to find that his paper *On the Anatomy and Affinities of the Family of the Medusa* had been published in the *Philosophical Transactions*. Thus encouraged, he set to work to arrange his large accumulation of facts and observations, with a hope (which was disappointed) that the Admiralty would contribute towards the cost of their publication. In 1851, papers on other branches of the same subject were printed in the *Philosophical Transactions*; and in the same year Mr H. was elected a Fellow of the Royal Society. In 1852, one of the two Royal Medals annually given by the Society was awarded to him, in recognition of the scientific value of the papers above referred to. In those papers, much light was thrown on the structure of a number of animals before unknown, or but little known, to British naturalists. In 1854, Mr H. was appointed Professor of Natural History in the Royal School of Mines, in place of Professor Edward Forbes, and, among his lectures in that institution, has delivered courses to working-men with beneficial results. In 1857, jointly with Dr Tyndall, he wrote a paper, *Observations on Glaciers*, which was printed

HYDNORA—HYDRAULIC CRANES.

in the *Philosophical Transactions*; and in the following year he delivered the Royal Society's Croonian lecture, *On the Theory of the Vertebrate Skull*, in which a highly important anatomical question was discussed. In 1859, his large work on *The Oceanic Hydrozoa*; a *Description of the Calycophoridae and Physophoridae* observed during his voyage, was published by the Ray Society with illustrative plates. He has since published papers on the *Glyptodon*, and the *Osteology of that genus*; and in papers on the *Mollusca*, has shown that those animals have a common type or plan, similarly to the *Annulosa* and *Vertebrata*. The views therein embodied have been set forth in a popular form in the *English Cyclopædia*, to which work Mr H. was a large contributor. He has also written articles in the *Annals and Magazine of Natural History*, the *Quarterly Journal of the Microscopical Society*, and the *Natural History Review*. Some of his Lectures, and a work on *Man's Place in Nature*, have appeared in a separate form. The title LL.D. has been conferred on Mr H. by the university of Edinburgh. He is Ph.D. of Breslau; is Hunterian Professor of Comparative Anatomy in the Royal College of Surgeons, and Fullerman Professor of Physiology in the Royal Institution. He is a Vice-president of the Zoological and the Geological Societies, and is a member of the principal scientific academies of the continent and the United States.

HYDNORA, a genus of plants of the natural order *Rhizanthaceae*. *H. Africana* is a native of South Africa, where it is called *Jackal's Kost*. It is a parasite chiefly on the roots of large succulent

Hydnora.

spurges, and is a plant of most extraordinary appearance and structure, resembling a fungus rather than a phanerogamous plant. Its flowers and fruit are entirely concealed in its interior. It has a smell like that of a fungus, or of decaying roast-beef. The South African savages roast and eat it.

HYDRASTIS, or **WARNERIA**, a genus of plants of the natural order *Ranunculaceae*, allied to *Anemone*, but having flowers destitute of petals, and succulent or *baccate* fruit, collected into a head. The only known species, *H. Canadensis*, a perennial herbaceous plant, with tuberous roots, and head of fruit resembling a raspberry, is common in watery places in Canada, and among the Alleghanies, as far south as Carolina. Its root is used for dyeing yellow, and also in medicine as a tonic. **YELLOW ROOT** and **ORANGE ROOT** are its American names.

HYDRAULIC CRANES have come into very extensive use within the past few years. Wherever a large number of cranes have to be worked near

each other, water-pressure is by far the most manageable, economical, and convenient mode of working them. Sir W. Armstrong & Co., of Newcastle, have taken the lead in introducing this kind of machinery. They have fitted up a great many railway goods-stations with complete systems of hydraulic cranes.

Fig. 1 represents one of the simplest forms of hydraulic cranes, such as are in use for loading goods in a railway station. It is made entirely of iron, and consists of two upright cheeks, A, between which there is fixed a hydraulic ram (similar to that used in the hydraulic press), occupying the lower

Fig. 1.

half of the upright frame A. The upper end of this ram carries a pulley B. A similar pulley is fixed to the upright frame at C. A chain is secured to a bracket, D, on the upright frame. This chain passes up over the pulley B, down and under the pulley C, and then over the pulley E, on the end of the jib of the crane. It is obvious that the rising and falling of the ram will cause the chain, F, to ascend and descend with its load G.

The ram is forced to ascend by the admission of water under great pressure by the handle H, which serves also to allow the water to flow out after it has done its work, and the ram descends by its own weight, allowing the chain, F, to run down with or without a load on it.

The pressure usually employed in working hydraulic cranes is greatly in excess of the pressure admissible in the case of steam. Six or seven hundred pounds to the square inch is usually employed as the working-pressure. It is got up to this great pressure by means of an arrangement called an accumulator, which consists of a large hydraulic ram of 16 or 18 inches in diameter, A, fig. 2, carrying a wrought-iron cylinder, B. This cylinder is filled with stones or gravel to the weight of 60 or 70 tons. A powerful horizontal steam-engine forces water into the cylinder C, and slowly raises the ram, A, with its enormous load. Pipes lead away from the cylinder to the cranes in the different parts of the station, and are thus supplied with water under the great pressure caused by the load B, fig. 2, forcing the ram A, fig. 2, into the cylinder.

The load B, fig. 2, is constantly rising and falling a little as the cranes draw their supplies from the cylinder C, fig. 2. If the cranes were supplied direct from the force-pumps of the steam-engine, without the intervention of this accumulator, their action would be jerky and unsteady. The accumulator acts as a reservoir of power, and when it happens that a great number of cranes are drawing off water at the same moment, and in excess of what the engine force-pumps can supply, the ram descends, keeping up the while the full 700 lbs. pressure; and then, when the cranes are demanding less abundant supplies, the engine overtakes its work, and sends the ram up again. When it arrives at the top, it touches a lever communicating with the throttle-valve of the engine, and thus slows or stops the engine when the accumulator has mounted to its

Fig. 2.

maximum height. The moment it begins to descend, the lever is relieved, the throttle-valve opens, and the engine goes on again with such speed as the work demands.

It is easily seen that when the pulley B, fig. 1, rises any given distance, the weight G will, at the same time, rise *double* that distance, because B raises a double length of chain; and, in the same way, by passing the chain twice, thrice, or any greater number of times over pulleys at B and C, fig. 1, the weight G, fig. 1, can be made to travel any number of times further than the ram. It is, in fact, the reverse action of a block and tackle. If the block is made to move, the *fall* will move further than the block in proportion to the number of times the rope passes over the sheaves. This kind of arrangement is adopted when it is desired to lift anything to a considerable height, such as grain to upper floors of a warehouse. There is, of course, a diminution in the weight the machine can hoist, in proportion to the excess of travel of the load to that of the ram.

The hydraulic lifts, or ascending rooms, now in use in many large hotels, are constructed on the same plan as the accumulator, fig. 2. A cylinder, C, is sunk 60 or 70 feet into the ground, thus admitting a ram, A, of nearly equal length to rise out of it, on a sufficient pressure of water being forced into it by a steam-engine. The ascending room takes the place of the loaded cylinder B. Balance weights are attached to the ascending room, to steady its movements, and to guard against any failure in the mechanism. A rope passing from bottom to top of the channel, through which the ascending room rises, affords to the person in the room the means of regulating its movements.

HYDRAULIC ENGINES are sometimes used where water under high pressure is obtainable. They do not differ in any essential particular from a steam-engine. As the pressure under which they work is from five to ten times greater than that of a steam-engine, they are much smaller. One form

of hydraulic engine is described under the head of WATER-POWER. Another common form is that of three small cylinders in which three plungers work. The water is admitted into the cylinders by means of valves, and forces the plungers outwards. These plungers are connected with a three-throw crank; and when they have completed their outward travel, or working stroke, the water is allowed to escape from the cylinder; the plunger then slides inwards, to be again forced outwards by a fresh rush of water admitted at the proper instant into the cylinder by the action of the valve.

HYPNUM, a genus of mosses, which contains many of the most common British species, growing on moist ground, in woods, on old trees, &c. Many species have stems of considerable length and much

Hypnum dendroides:

a, plant about half natural size; b, leaf magnified; c and d, capsule magnified.

branched. The fruit-stalk springs from a lateral tubercle. The *peristome* (see Mosses) is double, the exterior of 16 teeth, the interior a membrane divided into 16 segments, with alternate cilia.

HYTHE (A.-S. *haven*), a parliamentary and municipal borough and market-town of England, and one of the Cinque Ports (q. v.), in the county of Kent, 14 miles south of Canterbury, and about half a mile from the coast of the English Channel, at the east end of Romney Marsh. Lympe or Limne (the *Portus Lemanis* of the Romans), the ancient castle and harbour, about 2½ miles west of H., is now about two miles from the coast, the sea having gradually retired, first, to West Hythe, and then to the present haven, which is still silting up. The town stands chiefly at the foot of a cliff, and consists of one main street, running parallel to the sea, with smaller ones branching off. It has an interesting church, partly Norman and partly Early English. Under the chancel of the church is an extraordinary collection of human skulls and bones—many of the skulls having deep cuts in them—the age and origin of which are altogether uncertain. H. is now a place of great resort in the bathing season. The parliamentary borough of H. includes Folkstone, Sandgate, and some smaller places. Pop. of municipal borough, which includes West Hythe, 3001. H. is about a mile from the Folkstone and Dover Railway.

LICIA, a genus of trees of the natural order *Amyridaceae*, having pinnate leaves with an odd terminal leaflet, and white flowers in paniced racemes: the flowers having a small 5-toothed calyx, 5 petals, 10 stamens, and a cup-shaped disc with 10 crenatures on the margin, the fruit a drupe.—*I. icicariba* yields the American Elemi (q. v.).—*I. heterophylla*, a tree of Guiana, yields a yellow aromatic balsam, which long retains its fluidity, and is used as an application to wounds. The resinous seeds are very fragrant.—*I. heptaphylla* and *I. Guianensis*, also natives of Guiana, yield very fragrant balsams, which harden into a gray resin, used as incense in churches and for other purposes, and esteemed useful as a medicine in dysentery.—*I. altissima* is a tree 100 feet high, a native of Guiana, of which the wood is known as *White Cedar* and *Red Cedar*, and as *Acyori*, *Samaria*, *Mara*, and *Curana Wood*, is used for furniture and housecarpentry, and for canoes.

ICO, a town of Brazil, in the province of Ceara, in a plain on the Salgado, about 125 miles from its mouth, and 210 miles north-west of Parahiba. It is the most important town of the interior of the province. The greater part of the inhabitants are shopkeepers, who supply the interior with articles of European manufacture, receiving produce in return, which they send down to the coast. Pop. 6000.

ILHA'VO, a town of Portugal, in the province of Beira, five miles south from Aveiro, near the Atlantic, and mostly inhabited by fishermen. Pop. (1863) 8215.

IMO'SCHI, a town of the Austrian Empire, in the province of Dalmatia, 72 miles south-east-by-east from Sebenico, in N. lat. 43° 30', and E. long. 17° 15'. Its situation is among the mountains, about 1378 feet above the sea. There are markets twice a week, which are much frequented by Turks, who bring for sale horses, cattle, sheep, goats, pigs, grain, butter, cheese, &c., and buy wine, brandy, and manufactured goods. I. has of late rapidly increased in size. Pop., which probably includes a district as well as a town, 22,000.

IMPOO'N (*Antelope* or *Cephalopus mergens*), a

Impoon (*Cephalopus mergens*).

small species of antelope, very plentiful in South Africa, in wooded districts. It is about 21 inches

high at the shoulder, of a brownish-yellow colour, with white belly. The horns are short and conical, set far back, and inclined backwards. It lives solitary, or in pairs. From its habit of plunging amongst bushes when pursued, standing on its hind legs at intervals to observe its pursuers, and disappearing again, the I. is called *Duyker-bot* (Diver-buck) by the Dutch colonists of South Africa, among whom its flesh is in great esteem.

INAJA' PALM (*Maximiliana regia*), a South American palm, common in the countries near the Amazon; having a lofty, massive stem; very long,

Inaja Palm (*Maximiliana regia*).

drooping, pinnate leaves, with leaflets in groups of three, four, or five at intervals along the midrib, from which they stand out in different directions; numerous spadices; large woody spathes; and densely clustered elongate fruit, with a hard stony seed, a layer of soft pulp, and a tough skin. The leaves are sometimes more than 50 feet long. The great woody spathes are used by hunters to cook meat in, and with water in them, they stand the fire well enough for the purpose. They are also used as baskets and as cradles by the Indians. The fruit is eaten by the Indians, and is particularly attractive to monkeys and some kinds of birds.

INCUMBERED ESTATES' COURTS are tribunals, established under recent statutes, for the purpose of disposing more readily than the ordinary judicial machinery will permit, of landed property subject to incumbrances, or legal claims at the instance of other persons than the proprietors. The want of such courts was first felt in Ireland. A quarter of a century ago, the rents of many Irish estates did not suffice to pay the interest

of the debts created over them, and the number of such incumbered properties was increased by the abolition of the corn-laws in 1846, which lessened the demand for those products of tillage which had rendered the cultivation of the soil possible by cottier tenants. It was necessary that Ireland should become a grazing country; but it could only do so in the hands of capitalist farmers, or landlords farming themselves, and a complete revolution in tenure was necessary to put them in possession of the soil. The sluggish and expensive procedure of the Court of Chancery made it impossible to effect this; and it became necessary to call into existence some more simple machinery by which property could be transferred from the old to a new class of proprietors. An auction-mart rather than a legal tribunal was wanted, under the control of officers able to scrutinise titles and adjust claims on landed property with care, yet without undue delay, and authorised to sell incumbered estates in the open market, to hand over a good and simple title to the purchasers, and to divide the sum realised among the proprietors, mortgagees, and others concerned, according to their interests. To accomplish this, an act (11 and 12 Vict. c. 49) was passed in 1848; but, owing to defective construction, it was found inoperative. It was followed, in 1849, by a second act (12 and 13 Vict. c. 77), the object of which was to enable any owner of land, or of a lease of land for not less than 60 years unexpired, subject to incumbrance, to apply to commissioners, to be appointed under it, to direct a sale. Under the provisions of this act, three 'commissioners for the sale of incumbered estates in Ireland' were appointed, and constituted into a court of record, which, however, was not to be permanent. It opened its proceedings at Dublin, appropriately enough, in the deserted house of an 'incumbered nobleman;' and the first sale was made on February 21, 1850. The total number of petitions presented in the eight years ending 1857, was 4413, of which 1363 were lodged by owners. The number of absolute orders for sale during the same period was 3547. The gross amount produced by sales from the foundation of the court up to August 1859 was £25,190,839, of which there was distributed to creditors £24,229,027, including £3,692,611, allowed to incumberers who became purchasers. A sum of £961,809 remained in hand to satisfy unadjusted claims. At this period, however, the business before the court had almost ceased. There were, in fact, no longer mortgagees exasperated by long-suffering left to petition; all the incumbered land had been sold, and everybody with claims on it had been paid. The 'judicial auctioneers' had rendered a great public service; and it came to be a question if the new tribunal should not, with wider functions, be rendered permanent. Why should unincumbered not obtain the same privileges as incumbered estates? Why should the court not take cognizance of leases under as well as above £60? Mr Whiteside advocated the establishment of a permanent tribunal with these powers—one which would enable all owners and tenants nervous as to their title, to come before the court, and have it made capable of resisting all attacks. Accordingly, the Landed Estates (Ireland) Act (21 and 22 Vict. c. 72), passed in 1858, abolished the Incumbered Estates' Court, and transferred the judges and officers to the Landed Estates' Court, which was rendered permanent with the wider functions required, and with various other powers connected with the declaration of title, partitions and exchanges of land, the redistribution of intermixed lands, or other duties imposed upon it by subsequent statutes. The Record of Title Office,

the counterpart of the Land Registry Office in England, has been since placed under its direction. Between the 1st November 1858 and 31st January 1862, the amount realised by sales made by the Landed Estates' Court was £5,940,990; and the approximate capital value of estates brought under its jurisdiction, but remaining unsold, £3,664,966. The rental and value of the estates sold in 1863, 1864, and 1865 are indicated in the following summary:

| | 1863. | 1864. | 1865. |
|-----------------------------|-----------|-----------|-----------|
| Net rental of estates sold, | 69,151 | 83,300 | 60,338 |
| Amount of purchase money, | 1,373,361 | 1,342,639 | 1,051,992 |
| Number of sales, | 296 | 344 | 341 |

There can be no doubt that the statutes calling into existence these courts have facilitated a great revolution in the tenure of the land in Ireland. They have supplied the means by which the greater part of the soil has passed rapidly from cottier tenants (i. e., labourers paying rents determined by competition) and an embarrassed and non-resident gentry, to capitalist farmers and to landlords who cultivate the soil themselves, and under whom the country has rapidly increased in agricultural prosperity. The process has, however, inflicted great hardships on the peasantry, who could no longer subsist in their former numbers on the soil. The displaced cottiers have emigrated, removed in search of work to towns, or remained as farm-servants on their old holdings. It is asserted that all have rather benefited in their standard of living by the change, but this is denied even by many authorities who take little heed of the sentimental grievances necessarily involved in so great a displacement of the population; and it would at present be premature to express any opinion as to the ultimate effect of the legislative measures referred to on the political and social condition of the Irish people.—See 'The Story of the Incumbered Estates' Court,' by Percy Fitzgerald, which appeared in *All the Year Round*, published separately in 1862; and *Thom's Irish Almanac*, which gives annually a summary of the information contained in the Return made to the House of Commons.

In 1854, the West Indian Incumbered Estates' Court was established under the statute 17 and 18 Vict. c. 117, entitled 'An Act to facilitate the Sale and Transfer of Incumbered Estates in the West Indies.' The purposes and regulations were similar to those of the Irish Incumbered Estates' Act, the court of the chief commission being held, however, in Westminster, where it still sits.

INDIGO BIRD (*Cyanospiza cyanea*), a North American bird of the Finch family (*Fringillidae*), a native of the United States, as far north as the Missouri, which it visits in summer, and of Central America, where it spends the winter. It is about 5½ inches in length, of a beautiful blue colour, variously tinged and shaded, the lores and angles of the chin velvet black. It frequents open places on the edges of woods, and delights to sit singing on the top of a high tree. Its song is very sweet. It is easily domesticated, and is much in request as a cage-bird.

INGRES, JEAN DOMENIQUE AUGUSTE, one of the most eminent painters of the French school, was born at Montauban, September 15, 1781. A casual view of a copy of one of Raphael's pictures, inspired him (so it is said), at the age of ten, with the ambition to become a painter: he forthwith began to study drawing; and after having been successively the pupil of a M. Roques and of M. Briant, a landscape-painter, he went to Paris in his 17th year, and entered the studio of the great painter David. He remained with David as a pupil for four years. He carried off the second prize for

painting at the Academy of the Fine Arts in 1800; and in the following year, he took the first—an honour which has scarcely, in any other case, been awarded to so young an artist. The picture which gained for him this high distinction was 'The Arrival of the Intercessors at the Tent of Achilles.' It is now at the School of Fine Arts, and unquestionably it compares well with many of the works which have made him famous. In 1802, he exhibited two portraits, which still rank among his finest works of this class; in 1804, he exhibited a portrait of the First Consul, and also a portrait of himself. He again painted Napoleon, now become Emperor, in 1806, and the picture was bought for the Hôpital des Invalides. In 1806, he set out for Rome, where he continued to live for many years. He seems to have made a reputation in Italy early, and the commissions he received, including several from the pope, prove that his reputation stood very high. From his countrymen, however, the pictures which he sent to Paris, for many years met only with neglect or ridicule. It was at Florence, where he resided from 1820 to 1824, that he painted a picture which at length gained him a party of enthusiastic admirers among the Parisians. The picture was 'Le Vœu de Louis XIII.' It was exhibited at the Louvre in 1824, and though much decried as well as much admired, it still raised L., previously almost unnoticed, at a bound to the chief place among French idealist painters of that time. He received from Louis XVIII. the Cross of the Legion of Honour; and he was forthwith appointed to succeed Baron Denon as Professor at the Academy of the Fine Arts.

Now that he had become the acknowledged head and representative of a school of art, it was natural that his work should be subjected to a searching criticism, more eager to detect faults than discover merits. He brought upon himself a perfect tempest of discussion in 1827 by a work called 'L'Apothéose d'Homère,' which his admirers declared to be a masterpiece; while the party of his detractors—then numerous and influential—condemned it as bad in drawing, as poor in colouring, and especially as being ungraceful, coarse, and even vulgar in conception. The French critics seem now to be agreed not only that this was L.'s finest attempt at epic painting, but that it places him at the head of the French school, and on the level of the greatest painters the world has seen. Many foreign judges, however, are disposed to hold that the strictures originally made upon it were to a large extent well founded. The discussion which it originated ranged over all the painter's work; it was renewed year after year, and the bitter expressions of some of his critics made such an impression upon L., that from 1832 to 1834, he exhibited nothing but two portraits, and in the latter year embraced an opportunity which offered of again establishing himself in Italy. He became Director of the French Academy at Rome, a post which has been held by many distinguished artists, and in which his predecessor was Horace Vernet. This time, he remained in Italy for about ten years. During these years, he sent many pictures to be exhibited at Paris: these gradually wrought upon the public taste; and when he returned, he found his countrymen unanimous and enthusiastic in admiration of him, and in raptures about his latest composition—'Cherubini [the composer] Inspired by the Muse.' Since then, it has been treason in Paris to breathe a doubt about the greatness of Ingres. The state ratified the decision of the public by the liberality with which it bestowed its honours upon him. He was made an Officer of the Legion of Honour in 1841, a Commander in 1845, and Grand Officer in 1855; he was named a

senator on May 25, 1862; and he was soon after appointed a member of the Imperial Council of Public Instruction. He has been a member of the Institute since 1825. Many of his works are now in public collections. At the Paris Exhibition of 1855, a room was set apart for his pictures, and one of two grand medals of honour was awarded to him—Eugene Delacroix getting the other. He continued to exercise his art almost to the close of his life; and whatever may be thought of the success of his higher aims, he shewed himself to the last what he had always been, the most painstaking, conscientious, and learned of painters. The *Naiad* which he painted in 1861 ('*La Source*'), and which was his solitary contribution to the London Exhibition of 1862, is considered the finest of his later works; it was enthusiastically admired, even by those who strongly dissented from the praises lavished by his countrymen upon his more ambitious undertakings. He died in January of the present year (1867). During the summer, an exhibition of his works took place in Paris, at which almost all his pictures and the cartoons for his works in stained glass and mural paintings, were brought together.

'*L'Apothéose d'Homère*,' '*Le Martyre de St Symphœne*,' '*La Naissance de Venus Anadyomène*,' '*La Source*,' '*L'Odalique*,' and the portrait of M. Bertin, *ané*, may be mentioned as among the most characteristic—they are certainly among the most admired—of the works of Ingres. His admirers—who are at present the whole body of his countrymen—recognise in him, among modern painters, the most faithful and persevering, and the most successful student of the traditions of the Renaissance; they declare his paintings equal in power and fidelity to the best works of the great masters. On the other hand, it is maintained by his censors or detractors that L. was deficient in invention and in refinement; that all the good things in his works have been borrowed from ancient pictures; and that, moreover, he copied badly from his models, and often spoiled what he borrowed by his setting of it. Such censures appear greatly exaggerated; but it may be confidently said that L. is at present worshipped by his countrymen with a somewhat blind veneration; and that they would do well to expend upon a few really great works the admiration which they lavish upon everything that proceeded from him.

INJECTOR, GIFFARD'S, is now in general use for feeding water into steam-boilers, particularly locomotive boilers. Feed-pumps are difficult to keep in order when driven at high speed. The very rapid action of the valves severely tries their durability. In the case of locomotives, inconvenience was often occasioned by the fact, that their feed-pumps acted only when they were running; and thus, if an engine happened to stand still for any length of time, the water occasionally got too low in the boiler. The injector acts equally well whether the engine is running or at rest.

The diagram fig. 1 will give an idea of the essential parts of the injector. A is the steam-boiler, B being the water-level, CDF a pipe into which steam is admitted: this pipe terminates in a cone DF, which is enclosed in a larger cone HH. In the cone DF, the pointed plug E can be raised or lowered so as to increase or diminish the area of the aperture at its lower end F. G is a pipe communicating with the water-cistern, and admitting water into the external cone HH. K is a pipe communicating with the boiler under the water-level. On opening communications between the boiler and this apparatus, it might be expected that steam would rush out at F, and water at K, both currents meeting with great force, and escaping into

the atmosphere between the two openings. Paradoxical as it may appear, the outflowing stream of

Fig. 1.

water at K, although it is actually flowing under a greater pressure than the current of steam escaping at F, due to the head of water arising from the

Fig. 2.

difference of level between the aperture at K and the water-level at B, is overpowered, and driven back into the boiler; and not only is the outflowing current of steam at F able to drive back the stream

of water trying to escape at K, but the torrent of steam drags with it a large quantity of water with which it comes into contact as it is passing through the cone HH. This water finds its way into the cone HH, through the pipe G, from the tender or cistern, and constitutes the feed-water. The steam rushing from the aperture at F will necessarily be condensed by the cold water with which it comes into contact in the cone HH. The explanation offered of the action of this apparatus is as follows. The opening at F, through which the steam escapes, has nearly twice the area of the opening into which the water is to be forced at K. The opening in the cone HH is also larger than the aperture at K, and it appears that the mechanical power contained in the flow of steam from F is, as it were, transformed from a large area to a smaller, with a corresponding increase in its intensity. This diminution of its volume arises from its condensation by the cold water through which it has to rush in the cone HH. We get thus the mechanical power due to a column of large area concentrated into a small area, with a corresponding increase in its velocity, and to this increase of velocity is due the fact, that a current issuing at FH will enter at K, in spite of the counter-pressure at K. The injector for feeding boilers is rather an expensive apparatus, in consequence of the number of adjustable parts required to be provided. Variations in the pressure of steam require alterations in the area of the steam-passage, and in the distances between the mouths of the conical openings for the outflow and inflow of steam and water.

Fig. 2 shews in section an injector such as is now in common use.

Fig. 3 shews in section a simple form of injector for raising water. Steam issuing from the pipe S, into the vessel WR, will draw the water through the pipe T, and force it up through the narrow neck below R, to a height of about one foot for every pound of pressure per square inch. It is doubtful if those injectors can work so economically, as regards expenditure of steam, as ordinary slow-moving pumps; but they possess many conveniences and advantages, which are bringing them into use.

Fig. 3.

INNES, THOMAS, the author of *A Critical Essay on the Ancient Inhabitants of Scotland*, was the second son of James Innes of Drugask, in the parish of Aboyne, and county of Aberdeen. He was born at Drugask in the year 1662, and at the age of 15, was sent by his father, a zealous Roman Catholic, to be educated at the university of Paris. He was ordained priest in 1691, and took his degree as Master of Arts in 1694. He continued in France for some years, discharging his ecclesiastical duties, and assisting his elder brother, Lewis, Principal of the Scots College at Paris, in arranging the valuable records which had been deposited there by James Beaton, the last Roman Catholic archbishop of Glasgow. In 1698, I. returned to Scotland, and officiated as a missionary priest at Inveravon, in the old diocese of Murray. He again went to Paris in 1701, and passed the rest of his life at the Scots College, with the exception of one or more visits which he made to Britain. The great object of his life was to write the true history of Scotland, and to refute the fabulous narratives which had been hitherto generally received by his countrymen. The latter part of his task was fully accomplished

by his *Critical Essay*, which was published at London in 1729, in 2 vols. He had prepared himself for the work by a careful study of all the materials which he could find in the libraries of France, and of the books, whether printed or in manuscript, which he was able to consult during his journeys to England and Scotland. In the winter of 1724, he was seen by Wodrow, who had one feeling at least in common with him, and who thus refers to him in his *Analecta*: 'There is one Father Innes, a priest, brother to Father Innes of the Scots College at Paris, who has been in Edinburgh all this winter, and mostly in the Advocates' Library in the hours when open, looking books and manuscripts. He is not engaged in politics, so far as can be guessed; and is a monkish, bookish person, who meddles with nothing but literature.' In the *Critical Essay*, I. examined the authorities on which depended what was then generally received as the history of Scotland, and shewed how little reliance was to be placed upon them. But not content with overthrowing fable, he pointed out what the true history was, and where it was to be found. The difficulties in the way of this inquiry were very great. Even at the present day, when most of the materials for Scottish history have been printed, it is no easy matter for the student to examine them. In I.'s time, they were for the most part in manuscripts, whose very existence was unknown except to a few antiquaries. Every subsequent writer on this portion of Scottish history has admitted the high merit and the practical usefulness of I.'s work. He gave his ready assistance to all who were engaged in pursuits similar to his own, particularly to Bishop Keith in his *History of Scotland* and his *Catalogue of Scottish Bishops*, and to Dr Wilkins in his *Concilia Magnæ Britanniae et Hiberniæ*. To this last work he also contributed a valuable Letter on the ancient form of holding synods in Scotland. I. died at Paris on January 28, 1744, in the 82d year of his age. The *Critical Essay* has now become a comparatively scarce work, but has never been reprinted. It was intended by its author to be an introduction to a *Civil and Ecclesiastical History of Scotland*. One volume of this *History* was prepared by its author for the press, extending from the introduction of Christianity to the death of St Columba in 597; and another volume was also left in an incomplete state, bringing down the narrative to the year 821. The whole was printed in one volume by the Spalding Club in 1853, under the editorship of Mr Grub. Imperfect as it is, it forms a valuable addition to our historical literature, being distinguished by the same learning, acuteness, and moderation for which the *Critical Essay* is so remarkable. As has recently been observed, its author loved truth better even than he loved his church. A full biographical notice of I., and an account of his various works, will be found in the preface to his *Civil and Ecclesiastical History*.

IRETON, HENRY, an English general of the period of the Commonwealth, was the eldest son of German Ireton, of Attenton, in Nottinghamshire, and was born in 1610. He studied law at Oxford, but on the breaking out of the Civil War, offered his services to the Parliament. His connection with Cromwell, whose daughter, Bridget, he married in 1646, greatly advanced his interests. At Naseby, he was taken prisoner by Rupert, but rescued some hours after, when Cromwell's Ironsides decided the fortune of the day. I. was one of the most implacable enemies of the king, and signed the warrant for his execution. When Cromwell passed over to Ireland to subdue that country, he was accompanied by his son-in-law, on whose vigour, judgment, and tact he placed much reliance. Cromwell's presence, however, was soon required in Scotland, and

the complete subjugation of Ireland was intrusted to Ireton. His career was brief, but successful. He was, however, unsparring in his severity. On the 15th November 1651, he died of the plague before the walls of Limerick. His remains were conveyed to England, and interred in Westminster Abbey; but after the Restoration, they were disinterred, and burned at Tyburn. I. left one son and four daughters.

ISABELLA II. (MARIA ISABEL LUISA), queen of Spain, the elder daughter of Ferdinand VII. by his fourth wife, Maria Christina, of the Two Sicilies, was born at Madrid, October 10, 1830, and by a decree which set aside the Salic law in Spain, and was confirmed by the Cortes, March 29, 1830, became the heiress-apparent to the throne, which she ascended on the death of her father in September 1833, her mother being appointed queen-regent. An insurrection in favour of her uncle, Don Carlos (q. v.), who, according to the Salic law, would have succeeded to the throne, immediately broke out in the north-eastern provinces, and raged with great violence for seven years, but was ultimately suppressed by the aid of Britain, France, and Portugal. During this tumultuous epoch, effective internal administration was impossible, and it was necessary to conciliate as far as possible all parties, in order to prevent desertions to the Carlists. Before the revolt had been crushed, which was conclusively effected in 1839, politicians had begun to divide into two classes, the *Moderados*, or 'conservatives,' and the *Exaltados*, or 'liberals;' and though the queen-regent sided with the former party, she found it necessary to enlarge the liberal constitution of 1834, and ultimately (1837) to re-establish the constitution of 1812. The attempts of the Moderados to inaugurate a more narrow policy in 1839 failed, and Maria Christina was forced to flee to France, leaving the regency and the care of the young queen to Espartero (q. v.). On November 8, 1843, the queen was declared by the Cortes to have attained her majority; and this was followed soon after by the return of the queen-mother, the military dictatorship of Narvaez, and an anti-liberal policy. The question known as the 'Spanish Marriages,' which at that time agitated the different courts of Europe, was settled by French influence, the queen marrying her cousin, Don Francisco d'Assisi, eldest son of Ferdinand VII.'s youngest brother (October 10, 1846); while her sister, Maria Ferdinand Luisa, espoused the Duke of Montpensier, the fifth son of Louis Philippe. This marriage of the queen, based wholly upon the political interests of the party in power, has been fruitful of domestic annoyances, estrangements and reconciliations rapidly succeeding each other. After eight years of authority, during which he had repressed all liberalism with an iron hand, and foiled the intrigues both of the Carlists and the king-consort, Narvaez gave place to Murillo (January 1851), who began by promising liberal reforms, and agreed to a concordat with the pope. A change to almost purely absolute government in 1853, was followed by the banishment of many chiefs of the constitutional party, and a formidable rising of the army took place. The queen-mother fled to France, and Espartero was once more put at the head of an administration in which liberal principles held sway. But the queen disapproving of his policy, he resigned in favour of O'Donnell, July 14, 1856, who was soon after supplanted by Narvaez; and the latter, in turn, had (October 1857) to make way for a liberal government. In July 1858, O'Donnell was restored to power, and with the exception of a brief interval in June 1863, in which Narvaez was president of the council, maintained himself in the premiership till his death,

November 1867. The character of the government has of late years been utterly despotic, and the popular discontent is only kept down by the severest repression. The chief foreign events of I.'s reign have been—repeated negotiations of the United States with Spain, with the view of purchasing the island of Cuba; the rectification of the Pyrenean frontier; the successful war with Morocco (q. v.); the annexation and subsequent evacuation of St Domingo (see HAYTI); the discreditable squabbles with the republics of Chili and Peru; and difficulties with Britain, arising out of outrages perpetrated on some British ships and their crews.

By her marriage, I. has five children, one of whom is a son—viz., the Infant Alfonso Francisco, Prince of Asturias, born November 28, 1857.

ISKELIB, or **ESKILUP**, a town of Asiatic Turkey, in the pashalic of Anatolia, near the Kizil-Irmak, about 260 miles east of Scutari. There are several mosques and a ruinous castle on the top of a bold and naked limestone rock. In the neighbourhood are sepulchral caverns, some of which are sculptured. Pop. estimated at 9000.

ISLES, LORDS OF THE. The Lords of the Isles are famous in poetry and romance, but no proper historical account of them has yet been written, and it is difficult to discriminate between truth and fable in the various notices which have been preserved. The Western Islands of Scotland, or Hebrides, as they were afterwards called, originally a portion of the domains of the Scots and Picts, were afterwards subdued by the Norwegians. When Scotland became consolidated into one monarchy, its kings endeavoured to wrest the islands from the Norsemen; and during the contest which ensued, the various chiefs sometimes professed allegiance to the king of Scotland, and sometimes to the king of Norway, or their own more immediate superior, who ruled in Man. The Scottish supremacy was finally established by the victory of Larga, in the reign of Alexander III., and the final cession of the islands by Magnus, son of Haco, king of Norway, made in the year 1266. By that treaty, all the islands of the Scottish seas, except those of Orkney and Zetland, were surrendered to Scotland. Man was conquered by the English during the wars of the succession, but the other islands remained subject to the Scottish sovereigns. The first name which generally appears in the lists of the Lords of the Isles, as distinct from the kings of Man, is Somerled; and the great chiefs who afterwards held the islands and portions of the mainland near them, claimed descent from this powerful lord. He appears prominently in Scottish history in the middle of the 12th c., during the reigns of David I., and his grandson and successor, Malcolm IV. How he acquired his great authority, is not precisely known. Even the race to which he belonged is uncertain; probably, like most of his subjects, he was of mixed descent, Norwegian and Celtic. His sister was married to Malcolm Mac-Heth, the head of the great Celtic family of Murray, who has been confounded by most Scottish writers with the impostor Wimund, and whose true history has been explained by Mr E. W. Robertson in his *Scotland under her Early Kings*. In the year 1164, Somerled landed on the coast of Renfrew, at the head of his subjects of Argyle and the Isles, and was defeated and slain. His dominions seem to have been divided among three of his sons—Dugal, Angus, and Reginald or Ronald. The descendants of Dugal became Lords of Argyle and Lorn; and those of Reginald, Lords of the Isles. Reginald is said to have been succeeded by Donald, and Donald by Angus Mor, who was the father of Angus Og.

We know from Barbour that Angus of the Isles, 'Lord and Leader of Kintyre,' gave his fealty to Bruce when most hardly pressed at the beginning of his reign, receiving him into his castle of Dunaverty, and that he afterwards fought under the great king at Bannockburn. This chief is the hero of *The Lord of the Isles*, but his name, as Scott tells us, 'has been, *euphonia gratia*, exchanged for that of Ronald.' John of the Isles, son of Angus, married, first, his cousin, Amy of the Isles, and secondly, Margaret, daughter of King Robert II.; and among his descendants by these marriages are said to be the M'Donalds of Sleat, Keppoch, Glengarry, and Clanranald. During the troubled and disastrous reign of David II., John of the Isles was able to maintain himself in a state of practical independence of the Scottish crown. He was at last, however, obliged to submit. He met David at Inverness in 1369, and gave hostages for his fidelity. His successor was Donald, his eldest son by Margaret of Scotland, and the most powerful of all the Island lords. He set the kings of Scotland at defiance, and made treaties as an independent sovereign with the kings of England. He married Margaret, daughter of Euphemia, Countess of Ross. Margaret's brother, Alexander, Earl of Ross, by his marriage with a daughter of the Regent Albany, left an only child, who became a nun. Donald claimed the earldom in his wife's right; and when this claim was refused by the regent, he prepared to maintain it by force. Taking possession of Ross, he marched at the head of a large army from Inverness, through Murray and Strathbogie, entered the Garioch, and threatened to destroy the burgh of Aberdeen. At Harlaw (q. v.), near Inverury, he was encountered on St James's eve, 1411, by a Lowland army much inferior in number, commanded by Alexander Stewart, Earl of Mar. The action was fiercely contested, and, though not decisive in itself, the Lord of the Isles retreated, and all the advantages of the combat remained with Mar. This engagement, famous in history and song, probably saved the Lowlands of Scotland from Celtic supremacy. Donald was soon afterwards obliged to surrender the earldom of Ross, and to submit to the Regent. He was succeeded by his son, Alexander. This lord, like other great Scottish nobles, was seized and imprisoned by James I., who was determined to allow no rule in Scotland except his own. When restored to liberty, he again broke out into insurrection, but his army was routed; and in order to obtain pardon, he appeared at the altar of the church of Holyrood, and kneeling half clothed before the king, presented his sword, and implored forgiveness. After a short imprisonment, he was again pardoned. Upon his mother's death, he assumed the style of Earl of Ross, and seems to have been in possession of the earldom. He was succeeded as Earl of Ross and Lord of the Isles by John, his eldest son. John, like his predecessors, acted as if he were an independent sovereign rather than a vassal of the king of Scots. He entered into a confederacy with the earls of Douglas and Crawford, the one, the most powerful nobleman in the south, the other, in the centre of Scotland; and had they acted together with promptness and determination, the House of Stewart might have ceased to reign. In October 1461, at his castle of Artornish, on the coast of Argyle, he granted a commission to his kinsman Ronald, and Duncan, Archdeacon of the Isles, to enter into a treaty with Edward IV. of England. By that treaty, which was concluded in the following year, he agreed to become liegeman to Edward, and to assist him in conquering Scotland. He was attainted more than once, and finally was obliged

to resign the earldom of Ross, which was annexed to the crown. This took place on the 10th day of July 1476, and John was at the same time created Lord of the Isles. He is said to have died in 1498. After his decease, the title of Lord of the Isles was assumed by Donald the Bastard, son of Angus of the Isles, an illegitimate son of John, Lord of the Isles; and several chiefs were attainted in 1503 and 1505 for supporting his claims. In July 1545, another Donald, styling himself Earl of Ross and Lord of the Isles, presiding in a sort of Highland parliament, granted commission to the Bishop Elect of the Isles and another person to enter into a treaty with the Earl of Lennox, then acting for Henry VIII of England. This document is given by Mr Tytler, the historian of Scotland, who remarks that 'it is a diplomatic curiosity, not one of the Highland chieftains, eighteen in number, being able to write his name.' In a paper addressed by the Highland Commissioners to the Privy Council of England, they speak of their constituents as 'the auld enemies to the realm of Scotland,' the very name by which the Scottish Parliament was wont to speak of the English. Various persons, claiming to be descendants of John, Earl of Ross, assumed the style of Lord of the Isles; but the title does not appear to have been recognised after his decease, except as annexed to the crown. The eldest son of the Scottish sovereign has generally used the style of Lord of the Isles, along with his other titles.

ISMAILIS is the name of a very advanced 'free-thinking' Mohammedan sect, of the Shiite branch of Islam (see SHITES), which sprang up in the 9th c. A.D., and spread throughout Mohammedanism. Recognising Ali alone as the rightful successor of the Prophet, they held Abu Bekr, Omar, Othman, Moavia, to be usurpers, and counted their Imams, or representative prophets, from Ali only. The seventh Imam was one Ismail, who lived about 150 Hedjrah (772 A.D.), the son of Jafar Assadik, or rather of his son, Mohammed. He was supposed to be the righteous Prophet, the only orthodox, spiritual head. The notion of the Imam, in general, is that of an ever-living, though, at times, hidden, supreme guide of the people, who, after a time, is restored to humanity, or at least to the believing part of it. A prayer, preserved to us by Ibn Chaldun, will best shew the peculiar notion connected with this belief, to which no small part of Islam confessed. Every evening, a certain number of Imamichs prayed: 'O Imam, appear unto us! Humanity is awaiting thee; for righteousness and truth have perished, and the world is gone down in darkness and violence. Appear unto us, that we may, through thee, return unto God's mercy.' It was thought, in fact, that Ali himself had reappeared in every Imam, and that he would descend again, some day, 'from the clouds,' to unite all believers, and to restore the pure faith. The real importance of this sect, which had existed unobserved for some time, dates from Abdallah Ibn Maimun, whose father had been executed for professing materialistic doctrines, and trying to turn people away from the doctrines of Islam. Abdallah seems to have practically carried out his father's notions, but more cautiously. He is described by the Arabic writers as an utterly irreligious and unscrupulous materialist or 'Zendik.' The Messiah, whom he preached, stood higher than Mohammed himself, and though he did not exactly reject the Koran *en bloc*, he yet contrived to allegorise and symbolise away nearly all its narratives and precepts. But the systematic way in which Abdallah went to work, in trying to undermine, and eventually to abrogate, all Islam, and, as his biographers have it, to replace it by materialism, atheism, and immorality, is very remarkable indeed.

He established missionary schools; and the instructions given to the young missionaries were artfully designed to win over not merely all the different Mohammedan sects, both Sunnites and Shiites, but also Jews and Christians. The missionary's (dai's) first task was to win for himself the perfect confidence of the proselyte to be, by the affectation of great orthodoxy, and by a vast display of pious learning, chiefly Koranic. The disciple is by degrees to be cross-examined on difficult passages, on their 'spiritual meaning,' and on some points touched upon belonging to the physical sciences. Only matters of acknowledged obscurity and uncertainty are chosen as subjects of discourse, matters, the real understanding of which belongs exclusively to the 'aristocracy of learning.' Generally, the youth is so deeply impressed with the erudition displayed, the expectations raised, the mystery, and the rest, that he will follow gladly to the end. But, at times, the missionary meets with a less docile subject, a man who may be accustomed to discussions on these topics, who may have pondered over these things himself: the dai shall appear to accommodate himself to such a one's views, applaud all he says, and thus ingratiate himself with him; all the while taking care to shew himself well informed on those points which may be in favour with his disciple, and that mode of faith which he professes. All this is to be done very carefully, lest the other might 'suspect and betray.' The ordinary individual, on the other hand, is, after the first preliminaries, to be told that religion is a secret science, that most people know nothing of it, or utterly misunderstand it, that if the Moslems knew what degree of science God has imparted to the Imams, by quite a special favour, there would no longer be any dissensions among them. The disciple, whose curiosity has by that time been fully roused, is then to be instructed in a few allegorical interpretations of both the practice and theory of the Koran; and when he is convinced of the desirability to know more, and everything that the master knows, the latter is merely to point out to him that all this knowledge belonged of right to all Islam, but that the wickedness and perverseness of those who followed the wrong successor, has caused all dissension and infidelity in the community of the believers. It is the Imams who are the dispensers of the right interpretation, not people's own reason and judgment.

For the religion of Mohammed, they were to tell the disciple at this stage, was not a thing easy to comprehend. It did not mean to flatter the senses, or to dazzle by outward signs. It was, on the contrary, a difficult, the most difficult matter. Only angels of the first rank, or a prophet specially chosen, or a faithful servant whose heart God had searched and found true, were worthy of bearing this most precious of all burdens. By these and other speeches, the ordinary disciple is soon brought to revere and to admire the dai beyond all other men around him, upon whom he henceforth only looks as inferior beings and infidels, and his desire of knowing more or all becomes passionate. But hitherto the procedure has been discreet. All that was desired in this first preliminary stage, was to unsettle the man's faith. The preparatory questions put to the neophyte were so contrived as completely to puzzle and bewilder him (e. g.—Why did God take seven days to the creation of the world? Why are there twelve wells and twelve months? What is the figure of your soul?); and if the missionaries themselves proceeded to answer them, it was by allegorising interpretations of the Koran, the Sunnah, and the Laws. But they used the common artifice of stopping short just in the middle of an explanation, for they said, when pressed to

continue: 'These things are not lightly to be communicated; God always requires a pledge first. If you will swear into my hands, with the most solemn and inviolable oaths, never to divulge our secret, never to give any assistance to our adversaries, never to lay a trap for us, and never to speak to us unless for the purpose of telling us the truth, then I will tell you more.' When, if the neophyte has taken the requisite oath—and it is only at the very commencement of the initiation that oaths are of any moment to the Ismaili—he is further asked to contribute a certain sum of money, as a pledge for his sincerity. Should the convert, however, exhibit the slightest degree of reluctance either in swearing or in paying, he is instantly given up by the da'—a prey to the never-to-be-solved doubts of his heart.'

Thus far the *first* preliminary degree. In the *second*, the missionary begins to initiate the neophyte's mind into the doctrines of the Imamat—i. e., to prove to him, by arguments and proofs best adapted to his mind, how the understanding of God's religion can only be accomplished by following the revelations given to and communicated by certain special delegates; whose names are communicated to him in the *third* degree. There are, he is told, seven such Imams, as there are (according to the Koran, Sur. 65, 12) seven planets, seven heavens, seven earths—viz., Ali, Hassan, Husein, Ali Zein Alabidin, Mohammed Albakir, Jafar Assadik, Ismail. In the *fourth* degree, the proselyte learns that the number of the prophets whose task it was to abrogate at different periods the ancient forms of faith, and to substitute new laws, is also seven, like that of the Imams; that each of them had a 'companion,' to whom he confided his whole dispensation and its sacred meanings, and that the latter communicated the same in a secret manner, and by oral tradition, to another man after him, who again handed it down to a successor; until, after a string of seven such 'successors,' or *samei* (silent ones), in contradistinction to the prophet (*natik*) or speaking, teaching one, a new Imam is born. The traditional chain has thus never been broken. After seven times seven such successions of prophets and their 'silent' successors—during which seven religions were successively abrogated—there appeared the last and crowning prophet, who abrogated all the religions that were before him, and who is the 'chief of the last century'—the last *natik*. These seven are: (1) Adam, with his companion ('Soos') Seth; (2) Noah, with Sem; (3) Abraham, with Ismael; (4) Moses, with Aaron. The last of the seven 'silent ones' that followed him was John, the son of Zachariah. The 5th is Jesus, the son of Mary, with Simon 'Kepha'—by them supposed to be Arabic = purity. The 6th of the 'speaking prophets' is Mohammed, the son of Abdallah; with him was Ali, the son of Abu Talib; and he was followed by six other 'silent ones,' who transmitted to each other the secret mysteries of his religion; the last of whom was Ismail, the son of Jafar Sadik. The 7th of the prophets is the 'Chief' or 'Master of the century.' In him culminate and are completed all those sciences which are called 'the Sciences of the Primeval Ones.' It is he who has first fully opened up the inner and mystic meaning of the words of faith; from him, to the exclusion of every one else, their explanation is to be received. He, and he alone, is to be followed, obeyed, and trusted in all things. By utterly submitting to his words and teachings alone, man is in the right path. All the prophets and all their teachings without exception before him are abrogated through him and by him.

In the *fifth* degree, the Koran and its precepts

are made the subjects of discussion. It is proved to the convert how utterly wrong and foolish it is to interpret the words in their usual sense. Here, again, great subtlety is brought to bear upon the disciple. If he be a Persian, he is told that the Arabs are the oppressors of his country, upon which, with other humiliations, they have also imposed the slavish worship of this book. If he be an Arab, his mind is wrought up against the Persians, who, he is told, have appropriated to themselves the pontificate and the sovereignty, that by rights belonged to the Arabs. He is then instructed in a multitude of mystical relations of things depending upon numbers.

The practical religious instruction begins with the *sixth* degree, into which the neophyte only enters when fully prepared in his mind to deny all positive religion, and when he has given the most undoubted pledges of his discretion and silence. Every Koranic precept is now allegorised. Prayer, tithes, pilgrimage, legal purity, and other religious observances, are cautiously and systematically interpreted to mean certain spiritual things only. These precepts, the missionary explains, have only been established 'as enigmas by the philosophical prophets and Imams, who saw in them the only means of keeping the common people in dependence, of exciting them to actions useful to society, of preventing them from hurting each other, and to commit gross crimes.' But by slow degrees, the philosophers, Plato, Aristotle, Pythagoras, and their systems are introduced to the neophyte. They and their systems are contrasted with the Prophet and the Imams, and their dicta. The result is represented as by no means flattering to the latter. He is distinctly shewn the absurdity of a blind belief in so-called historical traditions; it is made clear to him how hearsays and legends differ from reason and the full and free action of the logical faculties: in this way the open contempt with which the Imams themselves are then spoken of, no longer shocks the disciple to any very great extent.
